

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

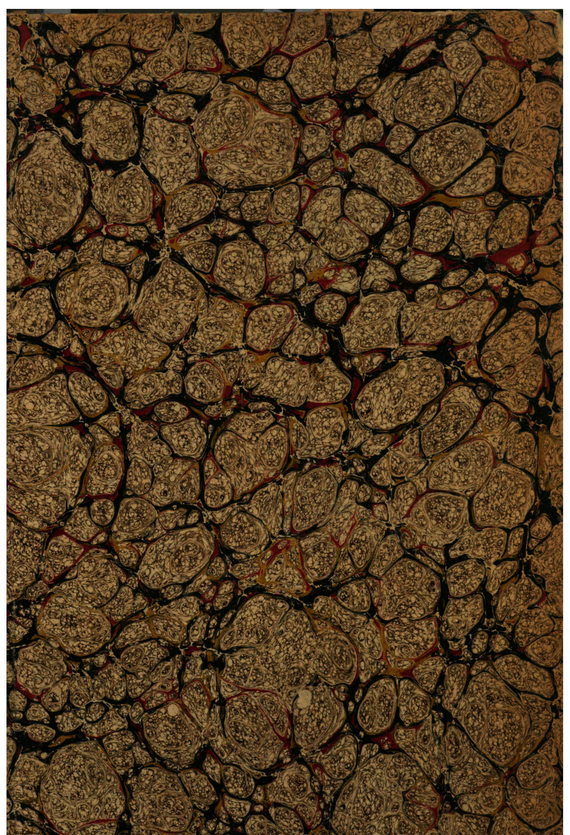
Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.



+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

SOLAR

Auto-mobile Gas Generators

Why Solar Gas Generators Always Satisfy. Because they embody the only correct principle of gas generation (wick feed) making flooding impossible. Are made round so as to enable each part to be drawn from 1 piece of heavy sheet brass (not 4 pieces soldered together). This absolutely removes the possibility of leakage and produces a steady supply of never failing gas.

3,622 Miles—No Tire Trouble

¶ If the man who buys the tires could see for a few days the letters received by us from users of

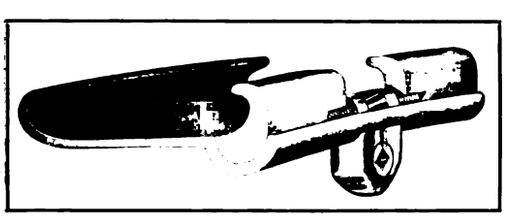
HARTFORD MIDGLEY TREAD TIRES
Clincher or Dunlop

particularly the letters that speak of durability, he would buy no other tire.

¶ Here is a sample letter:

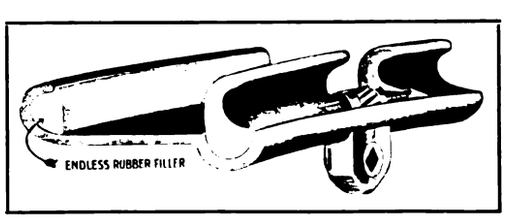
Pueblo, Colo., September 10, 1907.

THE HARTFORD RUBBER WORKS CO.,
Hartford, Conn.



Gentlemen: Last April I purchased a large car and had it fitted with Hartford Clincher Midgley Tread Tires. Have just completed a trip to Maine and return and feel that I should write you about them. We left Pueblo June the 5th. Followed the Santa Fe Railroad as far as Great Bend, Kansas, then diverged to the Northeast through Abilene, Salina, Beatrice, Lincoln and Omaha. From Beatrice to Omaha we got caught in very heavy rains and had to work our way through mud and clay ruts, which in two days time practically wore off the rubber from all the tires, which left the canvas bare. Fearing trouble, I asked advice of one of the leading automobile men in Omaha, and he said we would have no trouble in getting as far as Chicago. There I showed them to your agent and he pronounced them safe, so continued on to Maine. While there the machine was in constant use.

On our return trip we came through Massachusetts and Connecticut, stopping at Hartford, where your factory is located. We came there with the intention of having the tires either recovered or securing new ones The total mileage to Hartford was 3,622, yet the rear tires had been inflated only once and there were no punctures. The treads were apparently as good as when we left Pueblo and would have been safe for the return trip. We secured new ones August 2d, and came home through Southern New York, skirted the Catskills and came over some very bad roads, in fact the worst on tires of any that we had struck, and arrived here Sept 2d. We did not have a puncture and did not have to inflate them, and they show but very little wear.



We had so great confidence in them before leaving Pueblo that we did not take even an outer casing, and we found our confidence well placed. We traveled 2,649 miles on our return trip from Hartford.

Yours very respectfully,
GEO. E. KING.

These cuts show the New Midgley Universal Rim, easily the greatest rim invention since the inception of the industry. This rim accomodates EVERY MAKE of Clincher or Dunlop tires, as well as every type of mechanically fastened tires, EXCEPT ONE. Standard measurements throughout, including inside diameter.

Locomobile

ESTABLISHES NEW RECORD FOR ENDURANCE AND RELIABILITY

The 24-hour relay race recently held at Milwaukee was won by a 1907 Locomobile, type "H" 35 H. P. The distance covered was 1146 miles, which performance establishes a **world's record** for this type of race for a mile track.

The Locomobile used in the race is owned by Dr. Schreiber, of Milwaukee, and it has been in almost constant use during the past season which makes its performance all the more creditable.

The average speed maintained during the 24 hours was 47¾ miles an hour,—a splendid performance for a car having a four-cylinder motor of 4½ inch bore and 5½ inch stroke. Fifty miles were covered during the last hour of the race. This gives an idea of the care with which our motors are constructed and the efficiency and reliability of our make-and-break ignition system and low tension magneto.

Dr. Schreiber's car was used all the time except when it was necessary to change tires. No mechanical troubles whatever were experienced except a slight leak in the radiator.

During the 24 hours' contest the Locomobile covered 100 miles in 2 hours, 1 minute and 9 seconds,—a splendid burst of speed for a rough track.

THE CAR BUILT FOR PERMANENCE

You're Sure of Your Trip

When you start in an American Mors you're sure of reaching the destined point without trouble or delay.

No matter what hills, what the condition of the road or other ordinary and even extraordinary automobile obstacles, the American Mors will get you there.

Every part of the American Mors is built to do a specific share of the work—and it does it.

No one part shifts the work on another.

They all work together harmoniously and make "the perfectly balanced car."

WINTON

SIX CYLINDERS EXCLUSIVELY

The Winton Company is the only company in the world making six-cylinder automobiles exclusively.

The reason the Winton Company has dared to follow this radical policy is that Mr. Winton has perfected a six-cylinder car that as completely outranks the best fours as the Twentieth Century Limited outranks ordinary passenger trains.

This new Winton Six-Teen-Six is precisely the car for the man who wants the best there is. Goes the route like coasting down hill. Widest range of speed, from flying to crawling, on high gear; threads its way through crowded traffic without shift of gears. Starts from the seat on compressed air. Once ride in the Six-Teen-Six and you'll love it.

Entire output limited to 500 cars, making it the Exclusive Car for 1908.

Purchase price includes five bow top, full set of gas and oil lamps, gas tank or generator, horn, tools and glass front.

Exhibit of the SIX-TEEN-SIX now on tour from coast to coast.

We shall exhibit at the Madison Square Garden Show, New York, Nov. 2-9.

The tire that satisfies

Is it easy to make a good tire?—One that is tough, and yet resilient; absolutely secure, but easily manipulated?

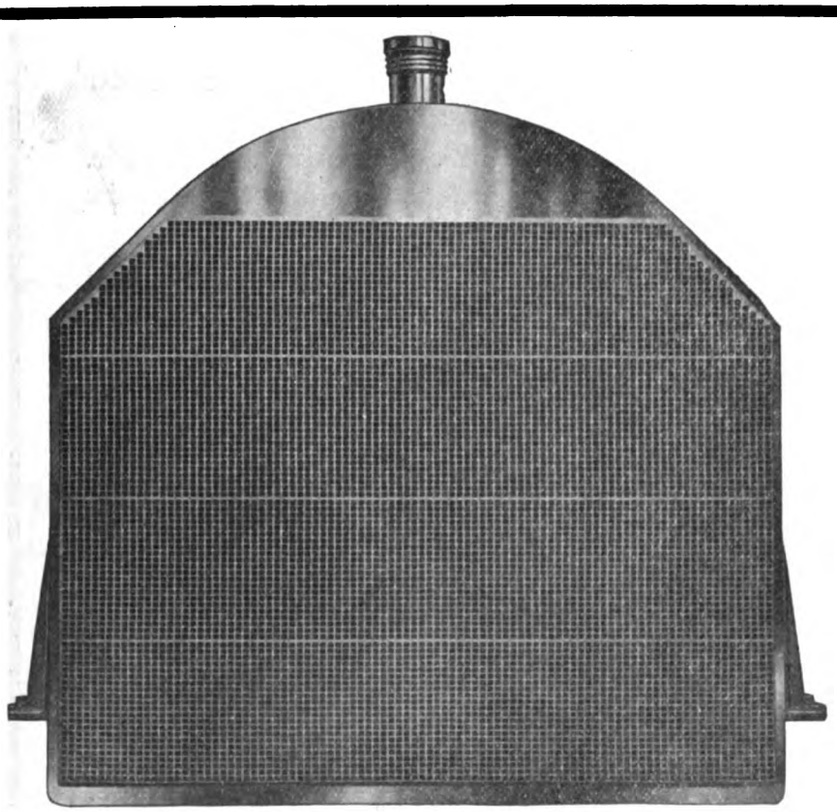
Money, brains, skill and years of experience are required to produce it.

As to the User

For the user but one quality is required—good judgment. Then he will specify

G & J Automobile Tires

They are at once the oldest and the best. If you are particular, insist on G & J Tires.



G & J Tires are provided with the oval raised tread or the Midgley anti-skid tread. Either the clincher or Dunlop type may be used interchangeably on the Midgley Universal Rim.

Model H

CADILLAC

$2500

Ready for Delivery

This car is now entering upon its third season. It is not a new and untried experiment placed on the market for you to try out at your own expense.

The first Model "H" turned out proved itself worthy of every claim that was made for it, but the new 1908 model represents all the refinement and perfection of detail resulting from two years' experience and tests in the hands of critical users.

Its splenidd motor, made as the Cadillac Co. makes motors, coupled with correct design and accuracy of every individual piece gives the Model "H" a smoothness, noiselessness and perfect balance in action which is not excelled in any car, regardless of its price and regardless of the number of its cylinders.

SPECIFICATIONS.

MOTOR—30 H. P., four cylinders, cast individually, accurately machined and ground. TRANSMISSION—Cadillac Planetary, three speeds forward and reverse. The simplest and most easily operated transmission ever devised. DRIVE—Direct shaft to specially cut and hardened gears. BEARINGS—Genuine Hess-Bright on transmission shaft, driving shaft, rear axle and front wheels. WHEEL BASE—102 inches. TIRES, 34 x 4 inches. INTERCHANGEABILITY—All parts made accurately to limit gauges and thoroughly interchangeable.

CADILLAC DEALERS CAN MAKE PROMPT DELIVERIES. **Ask for special catalog of Model "H."**

Also makers of the K-W Magneto and the K-W Master Vibrator.

THE LARGEST AUTOMOBILE SUPPLY HOUSE IN AMERICA

The Miller Speedmeter

The Miller Speedmeter is the simplest and most compact, durable and accurate speedmeter on the market. It works on the principle of centrifugal force. The entire governor mechanism is constructed from tool steel. It is arranged for adjusting the tension of springs at all speeds, and with this special constructed governor and spring adjustment, the springs are made and adjusted to show all speeds with absolute accuracy.

Rate of Speed—We wish to call particular attention to the fact that the Miller Speedmeter will register correctly at a low rate of speed, and the hand does not bob around or fluctuate when running at slow speed.

Flexible Shaft—The flexible shaft used in this instrument is made from tool steel and each link hardened separately before assembling. The cost of this shaft is more than four times that of the wire shafts generally used.

Driving Gears—The Miller Speedmeter is fitted with crown gears with an universal attachment, which permits of the instruments being attached to any style of car on the market.

Distance Traveled—The Miller Speedmeter is fitted with an odometer, which registers the distance traveled in miles, and has total and trip dials.

Finish—The material, workmanship and finish of the Miller Speedmeter is not excelled, if equalled, by any other speed indicator on the market. Each instrument is carefully tested on a special constructed testing machine before leaving the factory, and

Is Guaranteed for One Year.—The price of the Miller Speedometer complete, including odometer, with dial registering 60 miles per hour, $50.00.

AGENTS WANTED EVERYWHERE—We give a large discount to manufacturers, jobbers, agents and dealers in automobile supplies. Manufactured by the MILLER SPEEDMETER CO. (Incorporated), 15 Herman Street, Worcester, Mass.

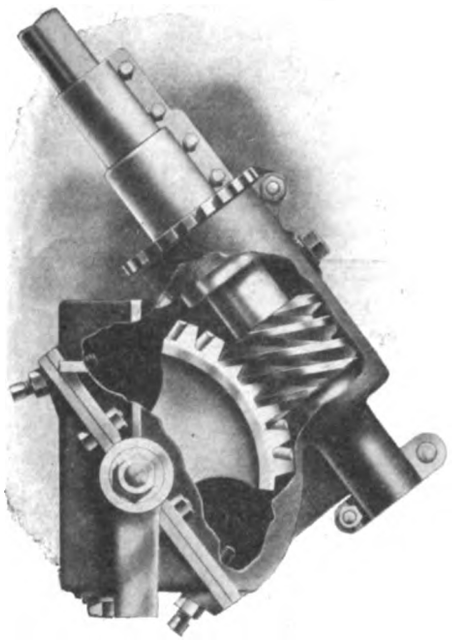
The Auto-Meter Again Sweeps the Board in the Glidden Tour

You noticed that the **Warner Auto-Meter** scored **another big victory** in this year's **Glidden Tour**, didn't you?

In this great **speed-and-endurance** race, where each contestant was required to make a **certain** point in **so many minutes**, it was necessary to know at all times just how fast they were going.

Now, when the great race **ended** at New York, it was found that

36 OF THE 48 CARS CARRIED AUTO-METERS



Think of it! At the finish there were exactly **3 times** as many Auto-meters as of all other speed-and-distance indicators **combined!** There isn't any room for argument, is there, when experienced motorists, like the Glidden Tourists, find that the **Warner Auto-Meter** is the only indicator they can depend on under all speeds and all road conditions.

You ought to have a Warner Auto-Meter on your car. Not only is it a great **convenience**, but it's really a **necessity** now-a-days. Inquire of any Automobile dealer about **Auto-Meters**, or write us, stating make and power of your car, and we'll tell you just what it will cost you to put an **Auto-Meter** on the dashboard. Matheson

THE MATHESON is standardized. The few changes for 1908 are unimportant refinements. The great string of Matheson victories during the past season, its new speed records, hill-climbing records, endurance records, its perfect scores galore in reliability contests, made, not only without need of repairs, but without even adjustments, all these have repeatedly proven to us that there is no room for improvement in the Matheson. We have sought in vain for records of performance that would direct the improvement of a single feature. Feature for feature through the world's output of high powered cars, there is nothing that can compare with the Matheson for performance over American roads.

This means that the motorist who purchases a Matheson to-day will have, years hence, a car which will be running as strongly, as reliably, giving as efficient and as economical road service as any high class car then offered for sale. The Matheson is so strong, so swift, so powerful, so simple, so economical, so luxurious, so beautiful, so utterly without a peer, that no use of ink and paper can convey to you its greatness in entirety. Write for our new booklet, "I Drove My Matheson," by Matheson owners, some of whom have driven 5,000 mile trips at an upkeep cost of 5 cents—some for less.

FOR CLINCHER

We have not been as loud or as sweeping in our tire claims as some have, but enough claims have been made for

MORGAN & WRIGHT TIRES

to put them out of the tire game had these claims not been lived up to—and more. The fact is, however, that literally thousands of motorists have been converted to the use of these tires during the present season—a statement that is based solely upon the actual increase in sales over last season. Is it at all likely that tires that were only fairly good could have taken such a hold on motorists?

FOR DUNLOP
(Note rubber filler in clincher on left.)

The Improved Midgley Universal Rim, illustrated herewith, accomodates every make of Clincher or Dunlop tires, as well as every type of mechanically fastened tires, except one. Standard measurements thruout, including inside diameter.

THE HILL-CLIMBING CAR

Half the pleasure of motoring is "taking the hills" with ease. **Mark XLVIII Columbia** is an exceptional hill climber, one instance of which is the winning of its class event in the **Algonquin Hill Climb** and making the best time of the day out of a field of **34**, many of which had twice the power of Mark XLVIII and were equipped especially for hill climbing. **This is a performance you cannot overlook. It means something.**

Rambler
Automobiles

For the year 1908 the entire facilities of the Rambler factory will be devoted to the production of two Models, 34 and 31.

Model 34, a five-passenger touring car with four-cylinder vertical motor, 32 horse power, has selective type transmission with shaft drive. The wheel base is 112 in., wheels 36 in., with 4-in. tires. Price, fully equipped, $2,250. The same chassis, however, with appropriate changes in detail, will be equipped with a roadster body with rumble seat, at the same price.

Model 31 is a five-passenger touring car with detachable tonneau, equipped with the Rambler unit power plant, comprising double opposed motor, multiple disc clutch and planetary transmission entirely enclosed. Price, fully equipped, $1,400. This model can be furnished with torpedo deck in lieu of the tonneau, at $1,300.

Both models have been brought to the highest possible degree of perfection in every detail that insures

Service, Economy and Comfort

A complete line of 1908 Ramblers will be shown at a private exhibit at the salesrooms of the Homan & Schulz Company, 38-40 West 62d Street, New York City, during both New York Automobile Shows.

You cannot afford to miss making a critical inspection of these 1908 models of

The Car of Steady Service.

Advance catalog now ready; write for a copy to-day.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, October 3, 1907. No. 1

RECEIVER FOR "SOCIETY FACTORY"

Lovely Stationery and Gold Tipped Cigarettes Fail to Save B. L. M.—Admitted They Were "Hard Up."

"Society" and business have refused to profitably intermingle in the case of the B. L. M. Motor Car Co., Brooklyn, N. Y. As a result and following a written admission of inability to pay debts amounting to about $30,000, on Thursday last, 24th ult., Jesse Watson was appointed receiver for the concern.

While the failure of the B. L. M. institution should occasion no great surprise and really is of no great moment, few anticipated that a confession that the company was "hard up" would mark its end. Individually, Messrs. Breese, Lawrence and Moulton are supposed to be well provided with the world's goods, and unless the popular notion is a wrong one, the receivership seems to indicate an internal upheaval of some sort.

It required about a year for the company to build a car after it was first announced and if many others followed it, few knew where they went; a good proposition of the output appeared to be in use by the "society triplets" themselves, "Jimmy" Breese in particular. Breese is a very full grown man with roving eyes and a perfectly lovely beard, but like all real things in "society"—he is one of the "Long Island set"—the diminutive "Jimmy" clings to him with almost affectionate tenacity. It is said that the B. L. M. establishment was well stocked with "Reggies," "Percys" and other dear boys, while its business stationery was a perfect dream and such a model of correctness in social etiquette that it matched the appearance, if not the odor, of Mr. Breese's delicious gold-tipped cigarettes. The letter heads were dainty creations of note size which even though unscented, were so sweetly embossed in green and gold that no lady could be blamed for preserving them. But not all of this "good form" was sufficient to make the "society factory" a success and it failed exactly as many an Avenue A delicatessen shop has failed.

St. Louis Now in Trustee's Hands.

James H. Sholl, who had been serving as receiver, was last week elected trustee of the St. Louis Motor Car Co., Peoria, Ill., which now is fairly in the bankruptcy court. The claims of Jesse French, Sr. and his wife, which were in the shape of notes amounting to $60,000, were suspended, as was also the claim of the Illinois National Bank in the sum of $15,000, and these claimants were not allowed to vote on the selection of a trustee. The objectors, who carried their point, claimed that preference had been shown to the bank, and that the capital stock of the French interests was not paid in full, inasmuch as the property which was turned over as payment for the stock was overvalued.

Weber Proves Right to Turntables.

In the United States Circuit Court, Detrict of Colorado, Herman Weber, of Colorado Springs, owner of the patents covering the Weber portable turntable trucks, has obtained a permanent injunction against the Pike's Peak Mfg. Co. and Stean B. Mansfield, for infringement thereof. Weber waived his right to an accounting as to profits and damages and was awarded nominal damages of $1, the defendant being required to pay the costs of the suit also. The patents involved are No. 772,014, Oct. 11, 1904, reissue 12,430, Jan. 2, 1906, and 863,122, Aug. 13, 1907.

Lende Moves to Minneapolis.

The Lende Automobile Co., which has capital stock of $250,000, and which has built a few four-cylinder air-cooled cars at Granite Falls, Minn., is removing to Minneapolis. It has leased for five years what is known as the Windstacker factory building, a three-story brick structure, 80 by 150 feet, and expects considerably to increase its output.

FAMILY NAME NOT A TRADE-MARK

Patent Commissioner so Decides in Regard to the Word "Rainier"—His Decision of General Interest.

Application made by the Rainier Co., for the registration of the name "Rainier" as a trade mark for motor cars has been refused by the Patent Office. The first refusal came from the Examiner of Trade-marks, from whose decision the Rainier Co. appealed to the Patent Commissioner. The latter, however, has sustained the action of his subordinate and as the use of similar family or geographical names now is quite general in the automobile industry, the Commissioner's decision in the Rainier case is of more than restricted interest.

"Registration was refused on the ground that the word 'Rainier' is geographical and on the further ground that it is the mere name of an individual not written in a particular or distinctive manner," says the decision.

"That the word 'Rainier' is the name of an individual is not controverted by the applicant; but it is contended, first, that it is not merely the name of an individual, and, second, that if it is merely the name of an individual it is written, printed, or impressed in a peculiar and distinctive manner and therefore registrable.

"This first contention is based on the ground that besides being the name of an individual Rainier is the name of a mountain in Washington. This use of the word is, however, not its principal use, and its primary significance is as the name of an individual, as is shown by the fact that the word constitutes the distinguishing feature of applicant's name, which is apparently derived from the name of an individual. It is held, therefore, that within the meaning of the Trade-mark Act this name is merely that of an individual.

"The word is written in large script letters with a flourish extending from the let

Digitized by Google

ter 'R' beneath certain letters of the word. This is not such a distinctive display of the name as required by the Trade-mark act. A similar question came up in ex parte United States Brewing Company, (125 O. G., 352,) and it was held by the Commissioner that a family name printed in script on a diagonal line, the letters being shaded so as to appear in perspective and with a paraph under the word, was not such a distinctive display as to justify registration.

"The decision of the Examiner of Trademarks is affirmed."

Warner Opens New Branches.

The Warner Instrument Co. are "out for business" in no uncertain fashion. One of their moves in that direction will be the establishment of a branch in each of the more populous states. Last week one was opened in Cleveland, Ohio, with O. T. Foster as manager, who was transfered from the Detroit house. The latter vacancy has been filled by the appointment of George C. Weidner as manager. Weidner formerly traveled the west for the Warner company and, of course, is well versed in the virtues of their autometer.

Thomas Adds Town Cars and "Sixes.'

For the 1908 season, the E. R. Thomas Motor Co. have let it be known that they mean to develop the latent demand for town or suburban cars, which appears a move very much in that direction. For the purpose a light four-cylinder chassis of moderate power—20 horsepower—will be used on which will be mounted not merely runabout and limousine bodies, but brougham, landaulet and cabriolet structures. It now is also public property that a six-cylinder car will be included in the Thomas line for 1908; it will be of 70 horsepower.

Holmes Schedule Shows Small Assets.

Schedules filed by the Holmes Motor Vehicle Co., Boston, Mass., which failed several weeks since, disclose liabilities amounting to $38,261.36, and assets valued at only $308.74. Most of the debts are of a "family nature," however, the Charles Holmes Machine Co., Boston, being the largest unsecured creditor; its claim totals $28,116.31. The only secured creditor is the International Trust Co., of Boston, $4,657.42.

Cairo's Chance for a Factory.

If the citizens of Cairo, Ill., will provide a factory site and bonus of $5,000, R. W. Hunt and L. E. Schweitzer, of Chicago, have offered to locate a $40,000 automobile factory in that city. The promoters in this case vary the usual order by agreeing not to ask for the money until the plant is in operation.

Brush Resigns from Packard.

W. A. Brush, who succeeded W. B. Hurlburt as manager of the Packard Motor Car Co.'s New York branch, has resigned that office.

In the Retail World.

W. S. Maltby of Plainfield, N. J., has taken the Essex county for the Corbin car, and will open sales rooms in Newark.

Raymond S. Joo has closed his garage at 79 Orange street, Newark, N. J. He has become identified with the Roseville Motor Car Co., of the same city.

William Koch will erect a two-story garage at 223-225 North Sixteenth street, Philadelphia. It will be two stories high, 30x120 feet and will cost $7,500.

Rodney Curtis has contracted for the erection of a new garage at West Raven garage at 1501 Pennsylvania avenue, Denver, Col. The cost will approximate $3,000.

Smith & Euwer have contracted for the erection of a new garage at West Rayen avenue, Youngstown, Ohio. It will consist of two stories in brick and fireproofed.

A. Hosterman, South Bend, has moved his garage and repair shop to 205 North Main street to secure more elbow room. He formerly was located at 309 North Main street.

Lima, O., is to have a modernly constructed garage. Mack & Brooks have purchased for $12,000 the Ashton lot on West Market street and will erect a large garage, plans for which will be drawn at once.

Walter Flynn has disposed of his Wick avenue garage at Youngstown, Ohio, to Kleese & Wick. Flynn will go to Norwalk, Va., where he will open a garage in partnership with M. H. Logue and William Murray.

The Harnishfeger-Dugger Automobile Repair Shop and Garage, conducted by Alexander Harnishfeger and Oscar L. Dugger, at Evansville, Ind., has filed articles of dissolution. The firm will discontinue business.

The Central Park Auto Storage Co., which maintained an immense garage at 110th street and Central Park West, New York, has filed schedules in bankruptcy showing debts of $15,572; the assets amount to but $2,732.

Smith Bros., Los Angeles, have been opportioned a slice of Rainier territory—all of Southern California. Ezra E. Kirk, western sales manager of the Rainier Co. did the apportioning during his visit to Los Angeles last week.

The garage at Rochester owned by James M. Hallock and operated by Frank Adams, was destroyed by fire which started from a short circuit, on September 27th. Five cars were destroyed and the total damage amounts to $15,000.

The R. Kent Company is erecting a brick garage on Lauderdale street, Selma, Ohio. The building will measure 35x100 feet and will fill a needed want, as while there are more than a score of cars in Selma there has been no garage facilities.

L. C. Oliver has acquired the large building at the corner of Ashley and Ocean streets, Jacksonville, Fla., and has converted it into a garage. The floor space is 17,000 square feet, which is larger than all the other garages in the city combined.

The Buck Automobile and Implement Co. has purchased the Goodwin Automobile Co., Davenport, Iowa, and will take possession November 1st. The sales room, garage and repair shop will be enlarged and a full stock of tires and sundries be carried.

Fred J. Titus, who has been connected with Hary S. Houpt's New York agency for Thomas cars will forsake the allurements of Manhattan for an exilement in Newark, N. J., having been appointed manager of Houpt's Newark branch. Titus will begin his duties on October 15th.

Fire in the Bedford garage at 1291 Bedford avenue, Brooklyn, last Thursday, 26th inst., destroyed three cars and damaged the building. Five cars were run into the street before the flames could damage them. A careless bystander and a lighted match are supposed to have been the origin.

Harry Murch, for some time connected with Alvan T. Fuller in the Motor Mart, Boston, will shortly engage in business for himself at Worcester. The new firm will be Murch & Hidden, the latter being a Fitchburg man. They will have the agency in Worcester county for the Cadillac.

The J. W. Bowman Company, Boston, opened its new sales rooms at 911 Boylesston street last week. The building has been remodeled and made two stories instead of three, giving better ventilated quarters. In addition, the company will lease 10,000 square feet on the ground floor of the Copley square garage.

C. R. Newby, formerly with the National Motor Vehicle Co., and later with the Indiana Automobile Co., of Indianapolis, has been appointed general manager of the reorganized Boyd Automobile Co., of that city, which has secured the state agency for the Stevens-Duryea and several other cars. The company will remodel its building and add to its floor space and the stock of accessories.

The Blue Ribbon Garage on Fairfield avenue, Bridgeport, Conn., which is said to be the largest building of its kind between New York City and Boston, was formally opened last week. The building, which is three stories and basement high, is of solid concrete and steel, even the roof, which has a testing station on it. Improved lockers, dressing and waiting rooms, and all the other features of an up to date garage are numbered among its utilities.

Schulte Pressing Brooks Motor.

Peter W. Schulte, who had secured two judgments against the Brooks Motor Co., Detroit, has carried out his threat and applied for a receiver for the concern. The action is of small moment, however, as the Brooks company, such as it was, "went broke" in building its first car.

DAVIS' VIEWS OF THE SITUATION

Thinks Many Made a Gamble of the Business— Striking Evidence of Locomobile Preparedness.

With thirty 1908 cars already shipped, sixty to go forward this month, and 250 to be shipped by January 1st (and with a million and a half dollars' worth of material in the factory), the business of the Locomobile Co. of America is a refutation of the cry of hard times and depression in the automobile industry.

These facts and figures concerning Locomobile preparedness were gleaned in the course of a talk with Samuel T. Davis, Jr., president of the company, who was in New York this week to attend the meeting of the executive committee of the N. A. A. M., and who is sincerely enthusiastic over the 1908 product.

"For the first time," said Mr. Davis, "we have what we have been aiming at for several years. We always felt that we had a good car, and its reliability and lasting qualities were never questioned. At the same time, it was thought in some quarters that we were a little shy on speed. The 1908 Locomobile proved at Milwaukee its speed possibilities, and we feel to-day that we can go out and trim any stock car in this country. Though we rate our larger car at 40 horsepower, it develops from 57 to 60 horsepower in the tests and is a most satisfactory unit all the way through.

"The record of our ignition system the past year is especially gratifying, as out of six hundred cars in service not one magneto has been replaced; and the only wire in the whole car is about two feet long to permit of a cut-out button at the wheel. We would not for the world change or ignition system under any circumstances; its absolute reliability is one of the comforting features to Locomobile users.

"We have had to cut down the output of "our smaller car" in order to add to the number of big cars to be shipped, as on this smaller model we barely turn our money over; it is being continued only at the earnest insistance of our agents. This little Loco, by the way, has, we believe, more friends than any other car built. It is Locomobile quality all the way through; it is just as good as its bigger brother, and so perfectly balanced that an owner is assured of from six to eight thousand miles on one set of tires, while in many cases ten and twelve thousand miles have been obtained. We could next year sell many more than we should be able to build, but the orders on the larger car compel us to limit the number."

General business conditions, in Mr. Davis's judgment, are normal and not more than should be expected. The automobile business, in his opinion seems to have been the field for a lot of gamblers who, not understanding or appreciating the fact that it was a manufacturing proposition, threw their money into it in every direction with the expectation of its quickly returning in ten-fold lots. There is and will be a market for good cars of various classes, but the concerns which build them will have to be equipped for the work in hand and have a thorough knowledge of manufacturing conditions and of the requirements of the public they aim to serve. Lacking these factors the possibilities of success would seem to be remote indeed.

The Week's Incorporations.

Clyde, Ohio—Roberts Motor Co., The, under Ohio laws, with $100,000 capital. Corporators—B. L. Roberts et als.

Denver, Col.—Chicago Automobile Co., under Colorado laws, with $25,000 capital—Corporators—W. H. Ivion, S. M. Spafford and Mabel Clay, all of Denver.

Kansas City, Mo.—Fletcher Cowherd, Jr., Automobile Company of Kansas City, under Missouri laws, with $10,000 capital; fully paid. Corporators—Fletcher Cowherd, Jr., F. R. Sanborr and Fletcher Cowherd.

Houston, Texas—Empire State Motor Co., under Texas laws, with $10,000 capital; to deal in automobiles, etc. Corporators—B. F. Bonner, John N. Kirby, S. A. McNeeley, W. M. Baugh, T. J. Anderson, and Ray Weiss.

New York City, N. Y.—Weldless Chain Co., under New York laws, with $15,000 capital. Corporators—Walter B. Lasher and Clark P. Lane, Jr., Bridgeport, Conn.; Christopher Reckleff, 26 Liberty street, New York City.

Jamestown, N. Y.—Jamestown Garage Co., The, under New York laws, with $25,000 capital. Corporators—Howard Dow, 72 Allen street; Albert S. Price, 6 Ellicott building; and Henri M. Hall, Journal building, all of Jamestown.

Smith Succeeds Budlong in N. A. A. M.

At the regular meeting of the executive committee of the National Association of Automobile Manufacturers in New York yesterday, F. L. Smith, of the Olds Motor Works, was elected a member of the executive committee, to fill the vacancy caused by the resignation of M. J. Budlong, former representative of the Electric Vehicle Co. Most of the session was devoted to consideration matters pertaining to highway improvement, an address on the subject being delivered by Charles Thaddeus Terry, the association's attorney.

Melon Cut for Reo Employees.

The Reo Motor Car Co., Lansing, Mich., has given each of their employees of more than one year's standing, a most agreeable surprise. It took the form of a check equal to 5 per cent. of his annual salary, accompanied by word that a similar distribution will be made each year hereafter.

TO PRODUCE AUTO-METERS ABROAD

Warner Makes Arrangement with Foreign Company—Instruments to be Reproduced at Birmingham.

Realizing the importance and magnitude of the foreign business, the Warner Intsrument Co. for a long time have cast longing eyes toward the European field. Their output has been taxed to the utmost, however, in order to supply the American trade and for that reason they have never tried to interest the foreign market.

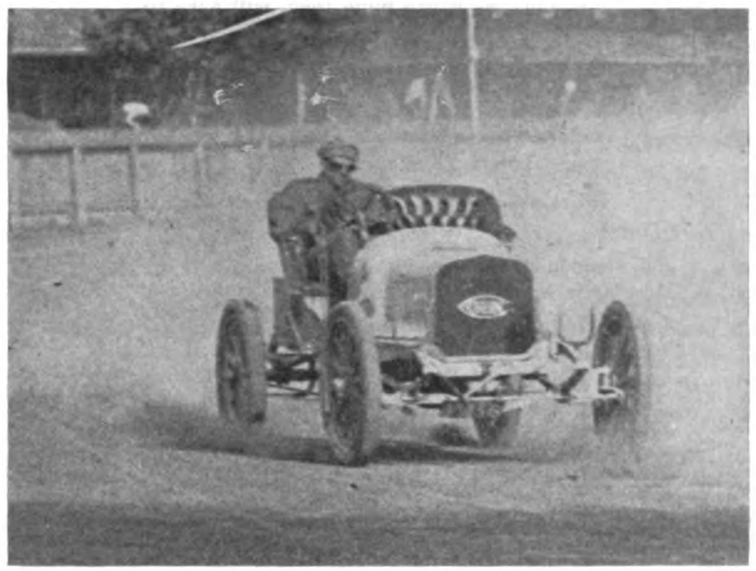
Opportunity, however, presented itself and offered a solution that will serve the same ends, the Warner people having just contracted with the Electric & Ordnance Accessories Co., Ltd., of Birmingham, England, for the production of their instruments on a royalty basis. This company is owned and controlled by Vickers Sons & Maxim, one of the largest manufacturing concerns in England making electrical instruments, which in the matter of machinery and workmen is unusually well qualified to reproduce the Warner. They will immediately start the manufacture of the Warner Auto-Meter and expect to make it as popular in Europe as it is in the United States. The Warner Instrument Co. naturally feel they are to be congratulated, particularly as the Electric & Ordnance Accessories Co. had already arranged and were ready to market a centrifugal type instrument, but after seeing the construction of the magnetic indicator, they abandoned their previous ideas and plans in order to take up the manufacture of the Auto-Meter, which is in the nature of action that speaks louder than words.

Attachments on Berkshire Property.

Attachments representing claims aggregating less than $3,000, have been placed on the property of the Berkshire Motor Car Co., Pittsfield, Mass., which had announced its permanent shutdown, unless the residents of that place came forward with fresh capital. Officers of the company say that all claims will be paid in full.

McCutcheon Makes a Change.

Charles G. McCutcheon, formerly sales manager of the Premier Motor Co. and latterly head of the McCutcheon Gear Co., Indianapolis, has been elected vice-president of the American Distributing Co., Cleveland, and will have to do with the sale of that company's ware. He probably will make his headquarters in the east.



Headed for Pacific Coast.

The Pacific Coast still is full of attraction for automobile sales departments. James Couzens, of the Ford Motor Co., and George H. Strout, of Apperson Bros Automobile Co., were among others who headed in that direction last week.

Preventing Theft and Accident.

In every city there is a large daily record of accident and theft due to cars being left unattended, without the protection of some device to make them inoperative except under the control of the rightful driver. The simple ignition switch with a take-off arm or a removable plug does not present any serious difficulties to any one who is sufficiently familiar with cars to attempt to drive one. Extra plugs that will fit into such switches are common in the pockets of loungers around garages and in the automobile districts, and only a little ingenuity is needed to close the contact on the switch with the removable arm. The gasolene feed pipe lock is something of an improvement, but perhaps the best of all is some method of locking the change gear lever in the neutral position. With such a device the motor could be left running with safety, and no sidewalk meddler with a penchant for tugging at the levers could start the car off.

The use of such protecting devices is surprisingly limited. Men who will surround $500 in cash with all the security offered by a combination safe, will leave a $3,000 car to the mercy of theft or smash-up because the fitting of a protective lock is "too much bother." The individual owner may not be aware of the danger from both sources that really threatens him, but the police records all over the country show an astounding number of cases right along where cars are taken, never to be heard of again, or are reduced to worthless wrecks by the incorrigible investigator who "monkeys" with the car at the curb. Except for the man who is indifferent as to whether he loses his car or not, the fitting of an effective lock is matter deserving of careful attention and early action.

Opportunity to Free "Slaves."

If the efforts of the hidebound community of Nantucket, Mass., to prohibit the use of motor cars on their precious island were not sufficient to do so, surely the idiocy of the Massachusetts law which is so strikingly exemplified by the Ashfield incident quoted in another column, should be enough to assure that if the American Automobile Association is sincere in its desire to prove itself really useful, the opportunity will not be permitted to escape. Action in a case of this sort will go far to answer questions, to silence criticism and to attract support. Indeed, the Ashfield case is so flagrant and the point involved so vital, that it merits not only the attention of the A. A. A., but of the National Association of Automobile Manufacturers and the other trade organizations.

Under the provisions of the Massachusetts law, the State Highway Commission is empowered to grant permission to petitioning communities to close certain supposed public roads or thoroughfares to automobiles. In Ashfield, as the experience of Mr. Arthur Kingsbury demonstrates, the permission has been invoked to such purpose that all roads leading to a certain part of the town are "posted," that is, automobiles are warned off. Mr. Kingsbury, on business intent, failed to heed the warning and as a result was placed under arrest. The effect of this provision of the law, as the Motor World remarked on previous occasions, is actually to prohibit a resident on a "posted" road or street from owning a motor car or, at any rate, from driving one into or out of his own domicile, which certainly is an astounding state of affairs.

Ashfield may be a rather small place, but the point involved—the freedom of the public highways—is a large one and one of universal concern. It concerns more than one State and individual and if the A. A. A. and the N. A. A. M. stand for such freedom they should not leave the battle to one determined individual or State association. The precedent involved is beyond price and will reach far.

We know, of course, that the N. A. A. M. has a test case pending in New Jersey and that the A. A. A. is seeking Federal aid, but in each instance it is not the open road that is in issue, but rather inter-State recognition of licenses. A favorable result in either case will scarcely open the "posted" roads in Massachusetts or in any other commonwealth.

Not later than last week on the occasion of the Springfield convention—Springfield being in Massachusetts, by the way—President Hotchkiss of the A. A. A., made a florid address in which he declared that automobilists always had been "slaves" but that they meant to be slaves no longer. The occasion is pertinent to remind him that actions speak louder than words. When is the "slavery" to cease? When does he mean to begin lifting the yoke?

Making the Garage Profitable.

Profitable garage management is undeniably one of the most difficult problems in the automobile trade. Many garages are maintained as mere adjuncts and aids to the sale of cars, without other hope than that in themselves they will come out even on the expenses. The reasons for such a policy are that the garage keeps its proprietor in touch with owners who may later buy new cars and the garage facilities give a dealer the opportunity to supplement his selling arguments with the assurance that when the purchaser gets his car he will be taken care of by mechanics skilled in handling that particular make. But for the man who looks to straight garaging and repairing for profit and income such competition is a menace that further complicates his many difficulties.

In a few cases a garage pure and simple

Digitized by Google

is paying, but by far the greater number of the flourishing garages have found that the most profitable results are to be obtained by combining the sale of accessories and supplies with the business. Successfully to sell these requires a measure of merchandising ability, something of which not every garage proprietor is possessed, but when properly done it yields substantial returns. The garage proprietor who lets his customers go in and out day after day without ever discovering that this one ought to have a new pair of lamps, a speed indicator, or a set of shock obsorbers, or that that one should use an accumulator instead of dry cells, or should buy his wife a pretty dust coat, or needs a tire jacket and a set of non-skids, had best go slow on ordering any stock. In fact under any circumstances the garage owner should keep his stock very light, the best plan being to talk the matter over with the customer first, persuading him of his need and offering to get the desired article for him at the proper price. It is easy enough to get the goods promptly from the jobber or the manufacturer without stocking heavily. But the main point is to let it be known that the owner can get anything he may want at his garage, meeting any complaints about not having things in stock by pointing out that there are advantages in getting fresh goods that are not shelf worn.

In a sense many garage owners have overlooked their advantages in this direction and have not seen all the possibilities which the nature of their business has afforded.

Transmission Relief Necessary.

Considering the great amount of wear and tear which is received by the components of the transmission gearing on all cars, and accepting the theory that it is largely if not entirely due to the racking strain brought about by the oscillation between the chassis and the running gear, it seems strange that designers should habitually ignore this most important factor in designing their cars. That its effect is taken into account, intentionally or otherwise, in designing the parts for strength, is almost a foregone conclusion, considering the long life of most transmissions, but the absence of any yielding medium in the line of transmission except as the slipping of the clutch may act in that way for the protection of the motor, leads to the conclusion that the need of such provision is being altogether ignored, or on the other hand, that its existence is not perfectly understood.

Whether the transmission be of the cardan shaft or simple chain type, the result of every plunge of the chassis upon the springs is that a certain amount of motion is imparted to the transmission gearing and is communicated through it until it is either taken up in lost motion between the parts, or expended at the clutch or motor. When the car is plunging wildly, this amounts to a succession of very small accelerations, first positive and then negative, and though most noticeable in chain transmissions, where it causes a distinct flapping of the chains, exists in the same way, though in varying degrees, in all types. The magnitude of such variations in transmission motion depends largely upon the method of design. In some cars it is very slight, while in others, as is evidenced by the frequent breakages of gears or chains, it is inordinately great. In every case is constitutes a source of frequent and intermittent stress of considerable magnitude, against which no direct provision is made.

In one or two foreign cars, a spring driving device is provided, for the double purpose of absorbing these and the shocks due to sudden starting, as well as the effect of roughness in the road which cause sudden and irregular variations in traction resistance totally apart from the plunging effect under discussion. These in what appear to be the best forms, take shape as a pair of discs placed in the driving shaft adjacent to one another and with corresponding lugs opposed and connected by helical springs, the driving action tending to compress the springs almost, but not quite, entirely. Thus a slight amount of yieldability is always present in either direction. A similar effect is secured by the use of a stout helical spring placed directly in the line of transmission. Other applications of the same general principle are conceivable, as for instance, the use of a secondary clutch of the disc type placed behind the gearset, and designed solely for the purpose of furnishing a certain amount of slip under sudden and extraordinary pressure, but otherwise remaining firm. Certain types of hydraulic clutch, so many of which have been designed, also are well suited to this purpose. Though as applied in the position of the ordinary master clutch, their use would be of little service in this respect.

COMING EVENTS

October 12, Rochester, N. Y.—Rochester Automobile Club's annual hill climb at Penfield Dugway.

October 24-31, New York City—Automobile Club of America's eighth annual show in Grand Central Palace.

November 2-9, New York City—Association Licensed Automobile Manufacturers' eighth annual show in Madison Square Garden.

November 30-December 7, Chicago—National Association Automobile Manufacturers' first annual exhibition of commercial motor vehicles in 7th Regiment Armory.

November 30-December 7, Chicago—National Association Automobile Manufacturers' Annual show in Coliesum and First Regiment Armory.

In any case, the application of such a device need not in the least complicate the present types of transmission in so far as design or operation are concerned, and certainly would be of advantage in the several ways indicated. This being the case, it is much to be wondered at that no such arrangements are used, especially since the evil which they chiefly aim to palliate appears to be inherent and irradicable.

The Motor World's views regarding laws entailing the payment of fees for registration and license and providing that the right to use the common highways may be revoked are fairly well known. Despite the increase of such enactments, nothing short of a decision from the Supreme Court of the United States will serve to dislodge our belief that the right to the free use of private property on public roads is an inherent, universal and irrevocable constitutional right.

But while such laws exist it is a pleasure to commend their enforcement without fear or favor, such as has prevailed under the administration of J. B. R. Smith, New Jersey's Commissioner of Motor Vehicles. The manner in which he has dared to defy the "pull" of a big political "boss" and to invite the thunder of a powerful daily newspaper, by revoking their licenses, to say nothing of the effective fashion in which he has suppressed the city-to-city record fiend, suggests that he is the right man in the right place, with small regard for his political future. It is rare that such equal and exact application of the law is witnessed.

RACED THROUGH MUD AND WATER

Cedrino Finished First in 24-Hour Contest at Morris Park—Rainstorm and Fatality Mars Long Grind.

The second of the 24-hour races held at Morris Park motordrome took place on Friday and Saturday, the 27th and 28th ult. It was won by Emanuel Cedrino and E. Parker in a 35 horsepower Fiat with a score of 984 miles. The mileage made by the winning car in the 24-hour race on the same track three weeks previous was 1,079 miles, but at that time the contestants did not have six solid hours of rain against them at the finish as was the case in the later race. Cedrino drove a 1906 Fiat, and not a 1908 model, as has been stated in some of the reports.

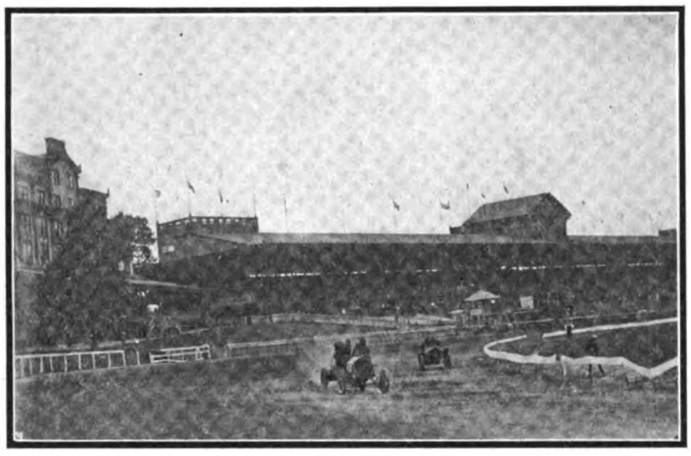
At the conclusion of the "twice around the clock," Cedrino, covered with rain and slush, drew up before the judges' stand and asked when he was to get the prize money, as he heard of the difficulties that some winning drivers had had at other 24-hour races in getting the promised plum. The winning car's share was $700, and a 35 horsepower Studebaker, driven by E. Holm and J. A. Ditman, with 878 miles, captured the $200 for second place, while a 40 horsepower Itala, polited by Charles Zumbach and Maurice Carriere and which had made 873 miles, took third money, $100.

The line-up was as follows:

No. 2, Lozier, Michener and Hutchinson; No. 3, Lozier, Linkrom and Smelser; No. 4, De Dietrich, Mack and McMann; No. 5, Matheson, Ryall and Adams; No. 6, Matheson, Lescault and Buck; No. 7, Frayer-Miller, Knepper and Webster; No. 8, Packard, Owen and Demos; No. 9, Welch, Truwin and Greenwood; No. 10, Simplex, Robertson and Poole; No. 11, Allen-Kingston, Campbell and Blakly; No. 12, Fiat, Cedrino and Parker; No. 14, Studebaker, Holm and Ditmar; No. 15, Darracq, Wallace and Nuneman; No. 16, Darracq, Griffith and McCulla; No. 17, Motobloc, Gilliurd and Block; No. 18, Rolls-Royce, Burns and Fuller; No. 19, Stearns, Vaughan and Warren; No. 20, Stearns, Schlipp and Helsas; No. 21, Itala, Zumbach and Carriere. The 35 horsepower Renault, which won the previous 24-hour race and which had been assigned No. 1, was withdrawn at the last moment. The reason given out was that Maurice Bernin, who with La Croix, was to have driven it, was suffering from a sprained wrist.

Of the 19 starters, only 7 finished, their respective scores being as follows:

Fiat (Cedrino), 984 miles; Studebaker (Ditmar), 878; Itala (Zumbach), 873; Frayer-Miller (Knepper), 756; Allen-Kingston (Campbell), 754; Simplex (Robertson), 696; Stearns No. 20 (Warren), 594.



Owing to the great number of starters it was necessary to send them off in divisions, so the machines were lined up in three rows of five each and one row of four, and were sent at five second intervals. Things promised well at the beginning, the large list of entrants indicating hot competition. The track was well lighted, the illumination being about four times as powerful as in any previous event of the kind, and the track had been put into excellent condition. The driving was at a very high tension for the first hour and Mack, in a De Dietrich set the pace at 52 miles in the 60 minutes. At the end of the second hour the Simplex, driven by Al Poole, was in the lead with 101 miles, the going being very much faster in the early part of the race than was the case in the previous grind.

Near the close of the third hour Arthur Warren's Stearns car limped off the track, the first break in the ranks, with more to follow. The Welch car, driven by Truwin and Greenwood, had an exciting whirl at the first quarter turn when a tire collapsed. The machine was going at a fast pace closely followed by several others. As it slewed when the tire went bad, there was every appearance of impending collision from the pursuing cars, but the driver let in his clutch again and drove through the inner rail, which was made of bunting, clearing the path for the on-coming cars just in time to avert accident. This daring move appealed to the crowd, and the driver was loudly cheered. After a quick repair, the car was put back in the race again.

The two Lozier cars had the lead by the end of the third hour, the first one, driven by Smelser and Linkrom, keeping in front until the eighth hour. Then Cedrino in the Fiat began to press hard for first place and finally captured it. After that he kept ahead and let the others follow as they might. In the thirteenth hour, which translated means 9 o'clock Saturday morning, the Lozier, driven by Smelser, went through the outer fence at one of the turns, due, it is said, to a tire going bad. Smelser was knocked unconscious by striking an iron water pipe that was fastened to the fencing, and died at the hospital an hour later. His skull and chest were fractured. Some spectators were more or less injured, but Hall, the mechanic on the car, when it went through the fence, was only slightly bruised. The other Lozier was shortly after withdrawn because of the Smelser tragedy.

Early in the afternoon another accident occurred. The Packard, driven by Embleton, had a tire come loose and went through the white bunting into the infield, where it rolled over twice. To the crowd in the grandstands it looked as though both driver and mechanician were killed. The latter soon crawled from under the wreck unhurt, however, and Embleton was found to be all right except for a sprained back.

In the afternoon the race was interrupted for two hours to give place to a short card of events for the entertainment of the spectators. These over, it was resumed again, with Cedrino in the Fiat far in the lead. No further accidents marred the proceedings but a heavy and steady rain set in, which made the track a bowl of oily slush. While the speed was greatly decreased by this condition, even greater skill was nec-

essary in the driving, as the turns were treacherous and even the straightaways were not free of uncertainty and dangerous possibilities. The dismal drizzle of the rain cast a damper on the spirits of the spectators in spite of the entertainment that was provided during the evening by a moving picture machine which gave views of the Vanderbilt cup race. A searchlight was cast on each car as it came by the grandstand, a new feature and one which has much to commend it, as heretofore it has proved very difficult always to identify the cars speeding by the stand in the dark hours of the night. Water having gathered in large pools on some parts of the track, there was a glorious splash when a car would strike one of the miniature lakes, but beyond this there was little that was interesting or picturesque in the last hours of the race. It was much like the mud plugging of the famous New York-Pittsburg endurance contest or the more recent Albany run. By the time Cedrino had finished his 24 hours, the grandstand seats which had contained about 7,000 spectators were nearly empty and it was a depressed procession that wended its way back to town after everything was over.

CEDRINO, WINNER OF THE 24-HOUR RACE

WRECK OF THE PACKARD

Postponement of Chicago Meet.

Jupiter Pluvius interfered with the plans of the Chicago Automobile Club to promote a fall race meet at the Harlem track last Saturday, and in consequence of a dangerous course the meet was postponed until this Saturday, 5th inst. A representative field of entries has been secured for the ten events, which embrace the following: Ten mile open for motorcycles, three mile open for stock cars listing under $1,500, five miles for runabouts under $3,000, one mile exhibition by Webb Jay, three miles for motorcycles, five miles for Chicago A. C. members, unlimited pursuit for stock cars, ten miles free-for-all, one hour invitation and five miles handicap for motorcycles. A 24-hour race had been originally planned, but was subsequently abandoned for lack of entries.

BERLIN'S LAUGHABLE GYMKHANA

Dog Gives Automobile Close Race—Horse Beaten in Stopping Contest—Other Amusing Events.

No automobile contests held in Connecticut in a long time caused more enthusiasm or furnished more wholesome and enjoyable sport than did the gymkhana events which featured the closing day of the Berlin Agricultural Society's annual fair, near New Britain, on Saturday last, 28th ult. The fun was of a most variegated character, and the stunts done were of the most mirth provoking description. At least one of the events, aside from its design to furnish amusement, was possessed of some value as to the controlability of the automobile.

The gymkhana started in the morning with a street parade in which many decorated cars were exhibited, and in the afternoon, 6,000 persons laughed at the stunts the cars and drivers were put through at the track. Corbin cars featured prominently and captured nearly every ribbon offered. The new water-cooled model driven by A. J. Maisonville covered itself with blue ribbons by winning three first prizes, one second and one third, besides tieing in another third. Maisonville won the cup to the driver scoring the most points.

Probably one of the most interesting races was the one in which a dog ran against an automobile for an eighth of a mile. Wesley Barbour, Corbin, was given a flying start over Professor Welch's traveling canine, and the race resulted in a neck and neck fight until within a few yards of the tape, when the automobile forged ahead and won out by a half second.

New Britain and Hartford people were given an instructive object lesson when a special event was run to determine whether a horse drawn vehicle or an automobile could be stopped quickest. William Doyle had a balky horse that he thought could capture the blue in a jerk, but A. J. Maisonville brought up his Corbin to a dead stop before the horse could get his fore feet planted in the ground.

A three-legged race provoked considerable merriment. Each car carried two passengers besides the driver, who started thirty feet behind the car, ran to it and scrambled aboard. After being driven a quarter of a mile they had to get out of the car, run once around it, remount and ride to the tape. Emile Brazil had his passengers better trained than those of Barbour, and won in a hop. The summaries of the events follow:

Dog versus automobile, one-eighth mile—Won by Wesley Barber, Corbin, over Welch's dog. Times, 0:30 and 0:30½. Automobile had flying start.

Dead man race, dummies picked up 100 yards from finish—Won by N. Wesley, Corbin; second, A. J. Maisonville, Corbin; third, James Corbett, Corbin.

Twenty-five miles an hour judgment race—Won by N. Wesley, Corbin; second, Fred Haines; third, tie between A. J. Maisonville, Corbin, and Dr. J. E. Stoddard, Corbin.

Half-mile hill climb on high gear—Won by A. J. Maisonville, Corbin; second, James Corbin, Corbin.

Dressing for the ball contest—Won by A. J. Maisonville, Corbin; second, Wesley Barbour, Corbin; third, A. C. Smith, Corbin.

Three-legged race—Won by Emile Brazil, Panhard; second, Wesley Barbour, Corbin; third, A. J. Maisonville, Corbin.

Half-mile slow race on high gear—Won by N. B. A. Carrier, Ford; second, James Corbet, Corbin; third, J. Carpenter, Ford.

Barrier contest, removing barrier 100 yards from the tape—Won by Wesley Barbour, Corbin; second, A. C. Smith, Corbin.

Ginger ale drinking contest—Won by A. J. Maisonville, Corbin; second, Wesley Barbour, Corbin; third, J. Carpenter, Ford.

Stopping contest between horse and automobile—Won by A. J. Maisonville, Corbin; second, William Doyle, 1 horsepower Equine.

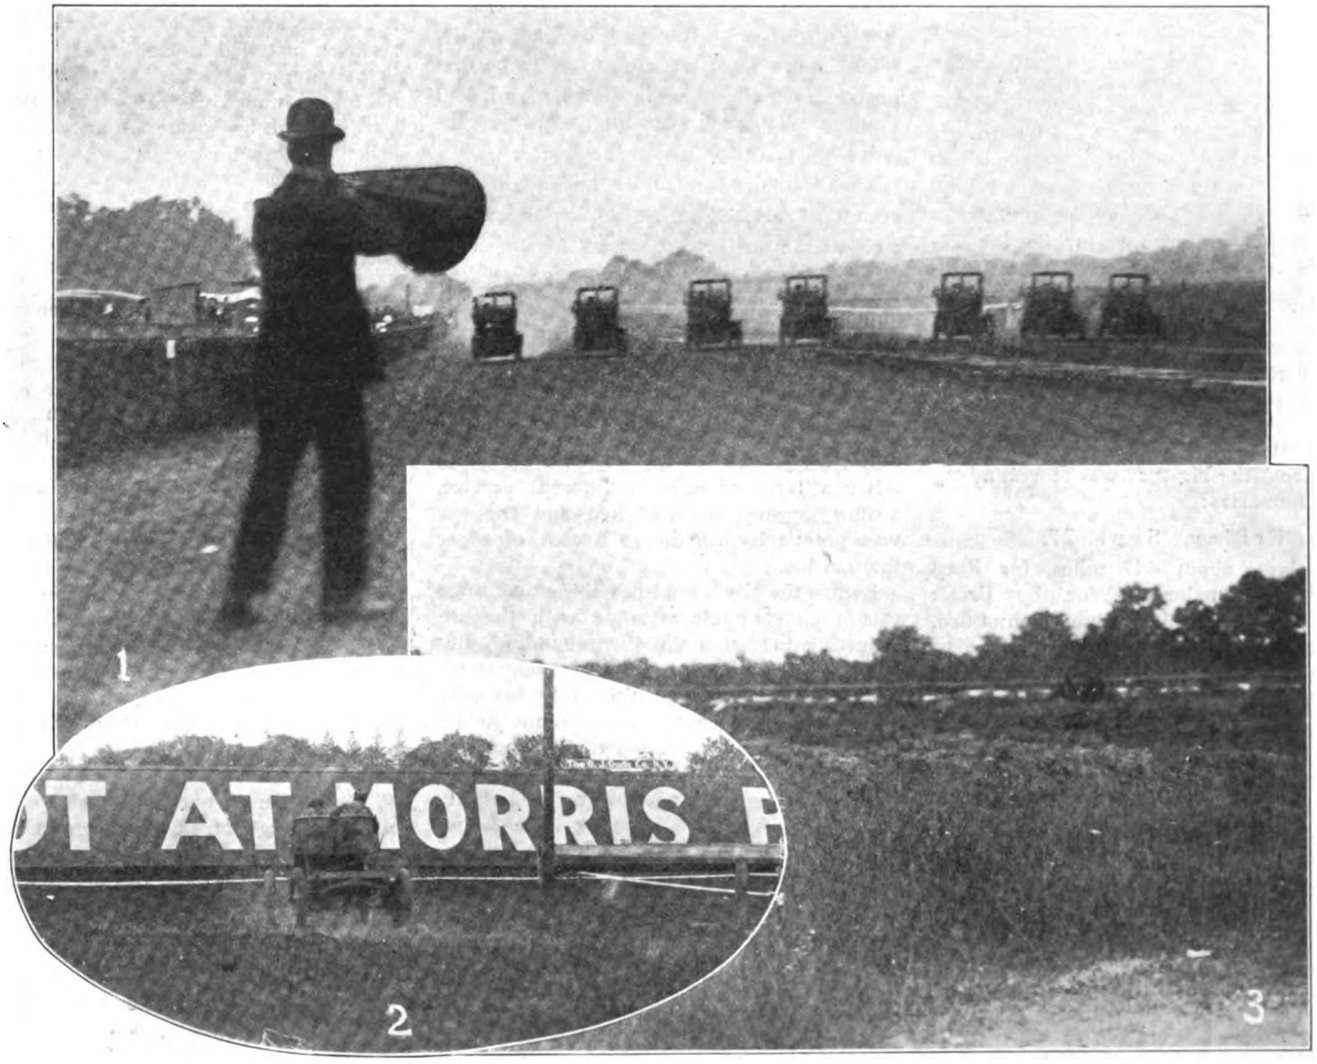
CURTAIN RAISERS AT MORRIS PARK



Events That Preceded the "Twice Around the Clock"—"Road Race" and Taxi-Cab Parade.

Efforts to introduce novelty into the Morris Park automobile meets have not been without some degree of success and interest. The automobile polo contest and the flexibility trial incident to the previous 24-hour race proved to be good features, but in connection with the last meet the "road race" over the Allen course, so called, in which the cars raced part of the time on the track and then cut over the turf on a marked course, to bump a few bumps and plow a few sand heaps, was scarcely what imagination had pictured.

This was one of the star numbers of Friday afternoon's short event program. It had been heralded as an example of how a road race could be held at Morris Park and the advance notices had described the terrors of the "hairpin turn" and the rigors of its hills and sand. The "hairpin" was rather abrupt and called for skilful driving, but it would have taken a gradometer with a micrometer attachment to discover the hills and the sand stretches would have lasted a canary cage for a day or so. The contestants made eight laps, a distance of about ten miles. W. H. Owen, by clever driving, won easily by a mile or more, but as a spectacular or exciting display it was sadly lacking and as a test for the cars it had a little bit more than the same quality as running a race over the undulating lawn of Central Park's playground, although at that both of Owen's rivals had to stop and tinker with their cars.

By far the prettiest event of the afternoon was the parade of taximeter cabs. New and lustrous, with varnish shining over the handsome maroon finish, seven of the vehicles which are promised to deliver New York from the piratical jehu, lined up abreast for what was programed as a slow race on the high gear. But the drivers did not seem to be aware of any such contest and went around in an even line across the track in "right dress" order. The trig smartness of their appearance brought a round of applause from the grandstand, although it is possible that some of the applauders were actuated by mistaken enthusiasm in thinking that the even line was caused by a close finish.

The other numbers on the afternoon's card included a three-lap race for Ford runabouts; three laps for single cylinder motorcycles; record trials for one mile; a motorcycle one-mile record trial and an eighteen-lap "Motordrome Championship" for cars of 60 horsepower or less. In the mile trials George Robertson drove in E. Russell Thomas's 120 horsepower Hotchkiss and did the distance in 52 seconds, not quite equaling Walter Christie's record of 51⅕, which latter was done on a mile track, while Morris Park is 1.39 miles. When the motorcycles tried for the same distance, Stanley T. Kellogg, on a 5-7 Indian, made it in 59 seconds. W. H. Wray, of Brooklyn, who with a Peugeot-Simplex has been showing great speed, was also billed to appear, but as he is under suspension by the

3. "SAND HILLS" ON THE ALLEN COURSE—PUZZLE: FIND THE HILLS

Digitized by Google

Federation of American Motorcyclists, was not permitted to ride.

The eighteen laps of the "Motordrome Championship," a distance of 25 miles, gave the six entrants a lively race. George Mack in a 60 horsepower De Dietrich was apparently getting away with it up to the fourteenth lap when a tire went wrong and Guy Vaughan, in a 60 Stearns, took the lead to the finish. George Fentie in a Packard took second, and Charles Schilipp landed third. The latter, after finishing, did not slacken rapidly enough in coming to the turn beyond the finish line, and went over the outer bank, crashing into one of the big lighting outfits which awaited its evening's work at the track side. There was a lively scattering of men and boys to get out of the way, and the driver succeeded in bringing the car to stop before any one was hurt.

On Saturday afternoon, while the 24-hour race was stopped for two hours, a 20-lap "road race" over the Allen course, was held. Like the similar event the day before, this was won by W. H. Owen, in an American Mors. L. C. Nuneman, in the 80 horsepower Darracq that won the 1906 Vanderbilt cup race, made a mile record trial, but the best that he could do with the track torn up from the big race was 58 seconds.

The summaries:

Friday, Sept. 27.

Three laps, about 4.17 miles, for Ford four-cylinder runabouts—Won by Frank Dunnell; second, Walter Livingston; third, E. Rogers' Stearns. Time, 8:07.

Eight-lap road race over Allen course, about 10 miles—Won by W. H. Owen, American Mors; second, Ned Crane, English-Daimler; third, Charles Truwin, an uncrowned king's car. Time, 22:13.

Three-lap motorcycle race, for machines of less than 30½ cubic inches—Won by Walter Goerke, Indian; second, John L. Seidell, Indian; third, Frank P. Baker, Indian. Time, 5:35.

Mile trials—George Robertson, 120 horsepower Hotchkiss. Time, 52 seconds. William Wallace, 80 horsepower Darracq. Time, 0:56⅕.

Motorcycle mile trials—Stanley T. Kellogg, 5-7 Indian. Time, 59 seconds. A. G. Chapple, 6 N. S. U. Time, 1:24.

Twenty-five mile Motordrome championship, eighteen laps—Won by Guy Vaughan, Stearns; second, George Fentie, Packard; third, Charles Schilipp, Stearns. Time, 27:54⅕.

Saturday, Sept. 28.

Twenty-lap road race over Allen course—Won by Wallie Owen, 40 horsepower American Mors; Ned Crane, 45 horsepower English Daimler, second; Arthur Rowley, 35 horsepower De Dietrich, third. Time, 54:31⅕.

Mile record trial—L. C. Nuneman, 80 horsepower Darracq, 56 seconds.

NEW YORK SELLS ITS "CASTOFFS"

Palatial Cars Acquired for Garbagemen's Use, Antiques Go Cheap—"Joker" in New Purchase.

Having recently acquired a big seven passenger touring car in order that the commissioner and his deputies may better week disposed of its "castoffs" at public dumps and other garbage heaps, the New York Street Cleaning Department last week disposed of its "cast offs" at public sale. There were three of them to be disposed of at the sale, these being an 8-10 Panhard about five years old, a big Searchmont and a little Orient buckboard.

The Panhard and the buckboard had seen hard service and showed the effects. As a result the one brought but $220, the other a beggerly $32.50. Except its tires, the Searchmont appeared to be in better shape than the other two, but the best the auctioneers could get for it was $125. This car had quite a history. Originally it had been used by the American minister in Cuba, who sold it to the city of New York. After a term of sadly indifferent service, a new engine was installed and the car was practically rebuilt at a cost of more than $1,100.

Before the city would pay this price, there was a considerable wrangle with the engineering firm that did the rebuilding. But the firm would not deliver the goods until its bill was paid and ultimately the city capitulated. When the Searchmont finally was received, it was found to have been so thoroughly rebuilt that it would not run at all; and, according to one apparently trustworthy story, it has never run a foot since that day. It has remained an elephant on the city's hands. No tears were shed when the auctioneer finally disposed of it last week.

Of course, the new seven-passenger touring car which replaces the "castoffs" was not selected with the faintest idea of "joy riding" for friends and families in mind New York's street cleaning commissioner and his deputies are so thoroughly honorable and conscientious that they would not permit anything of the sort! Capacity for seven passengers was necessary, because—well, because it makes it so much easier to inspect public dumps. Any man in a blind ayslum can see that without blinking. Everything connected with the purchase of the cars was similarly high-minded. For instance, the specifications inviting bids were drawn so that only one manufacturer could meet the call and yet despite this consideration it is said that some of the city officials are inclined to believe that the hands that passed out the plum were stung. It is alleged that they had been promised a $5,000 car for $4,000. They got it all right; but at about the same time the same car was advertised at retail for $4,000, which also will be the list price of the 1908 model.

Telharmonic Music for the Show.

One of the interesting novelties in the Madison Square Garden Show November 2-9, will be the introduction of telharmonic music to take the place of the brass band which has for some decades furnished the harmony for all the different kinds of shows which have been held in the big building.

It will be the first time that telharmonic, or electric music, as it is sometimes called, has been installed in such a vast arena. The Association of Licensed Automobile Manufacturers, under whose auspices the show is to be held, has made a contract with the Telharmonic company to furnish music for the entire week of the show. Special cables have been led from Broadway through Twenty-sixth street and into the Garden. These cables are strung in the ducts of the New York Telephone Company and are practically the same as the telephone cable, the music being conveyed from the Telharmonic Co.'s musical "power plant" on Thirty-ninth street, in which the music is made and from where it is sent, just as electric light or electric current is sent, to any part of the city.

The advantage of this modern system of music can be appreciated when it is understood that the music will radiate, so to speak, from probably one hundred dufferent trumpets scattered over the immense arena. It is likely that these trumpets will be concealed in draperies or behind pedestals so it will be impossible to tell where the music comes from or to even see the little trumpets from which the more or less pleasing sound emanames.

Arrangement has been made to so distribute the trumpets that at each space there will be enough music to entertain the visitors and at the same time in no part of the Garden will there be any disturbance or noise, as is caused by the playing of a big brass band perched high up in the galleries.

Chicago Employees Form Fraternity.

Daytime denizens of Chicago's "row" with the exception of proprietors and dealers turned out in force one night last week for the purpose of forming a fraternal organization solely for automobile employees, into which neither the sound of employers' footsteps nor the tumult of labor agitations and discussions may enter. The Automobile Employees Fraternal Association chose its officers as follows: President, J. Purcell; vice-president, W. R. Willett; secretary, L. A. Goodsell; treasurer, C. L. Herron; directors, J. A. Holsman, W. R. Willet, T. M. Hart, J. H. Philpott, and H. M. Simpson.

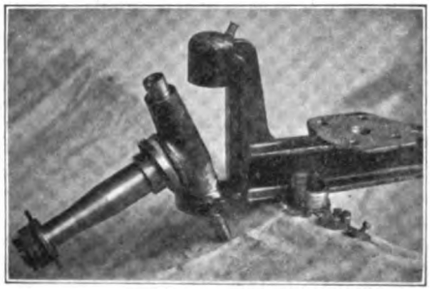
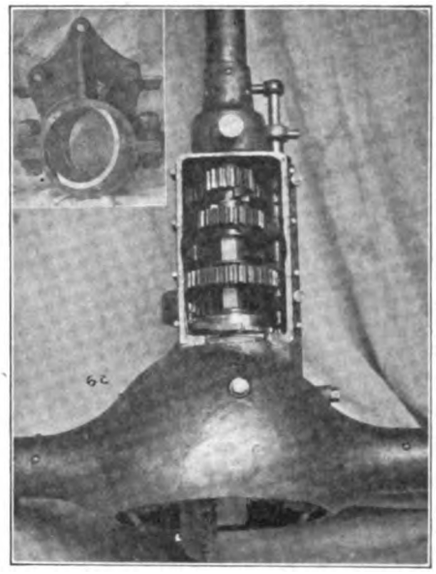
PENNSYLVANIA MODEL FOR 1908



New and Original Design Embracing Points of Particular Merit—Its Qualities of Serviceability and Endurance.

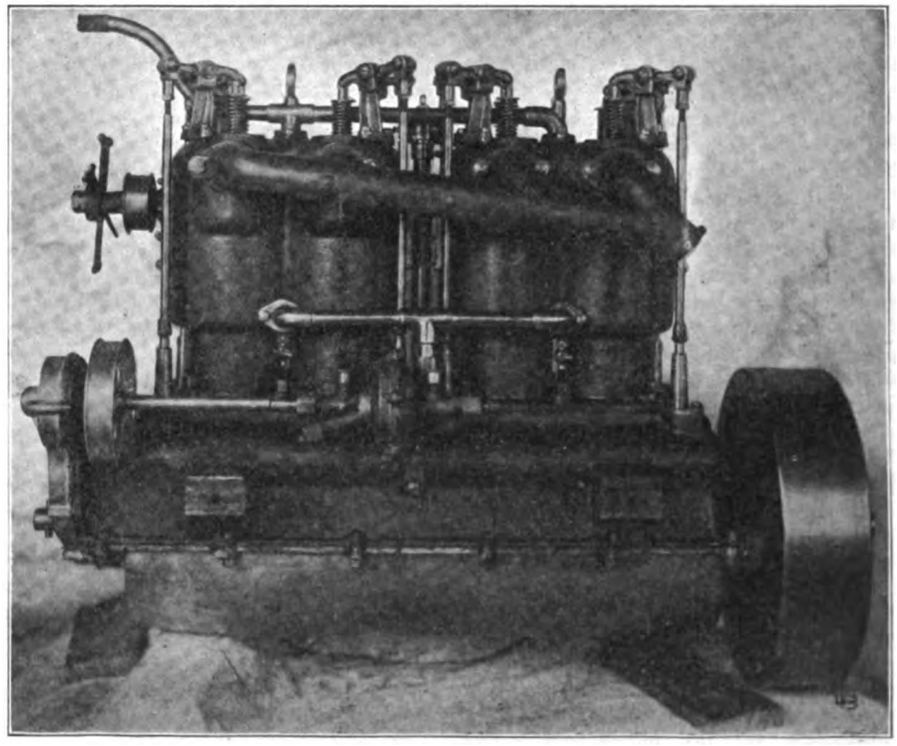
Of entirely new and original design, embodying several points of particular merit, the Type C, Pennsylvania car, which the Pennsylvania Auto-Motor Co., Bryn Mawr, Pa., has prepared as its 1908 output, is a car of parts, and one which promises well in the way of serviceability and endurance, these qualities having been given thorough and very evident attention in its delineation. It is a 40-45 horsepower model, of conventional mold, the outward characteristics of the earlier types of last year being retained, in a general way. The wheel base is 114 inches, clearance, 10 inches, weight, equipped with the standard aluminum body, 2,800 pounds, and price, $2,800.

1908 50-HORSEPOWER PENNSYLVANIA



How thoroughly the matter of endurance has been looked after in designing the motor, for instance, is evidenced in the bearing lengths, which for the crank shaft, aggregate no less than 14½ inches, the shaft itself being hollowed out for purposes of continuous lubrication of all the bearings. The cylinders are cast in pairs, their inner dimensions being, respectively 4¾ and 5¼ inches, both sets of valves being placed flat in the heads, and worked by overhead walking beams. An unusual allowance of jacket area has been provided over the heads, the jackets extending upward to include the full length of the valve cages, which is considerable.

STEERING KNUCKLE PARTIALLY ASSEMBLED



The cages referred to, are of independent unit construction, and with their springs and valves, may be removed in their entirety, a single locking ring serving to retain them in position. The springs are housed within caps, only the ends of the stems being exposed. The cam shafts work within the crank pit enclosure, the commutator shaft, which is vertical, taking its drive from the center of the inlet cam shaft. The circulating pump, which also, is gear driven, has a capacity of 8 gallons per minute, with a crank shaft speed of 600 revolutions per minute.

The master clutch of the transmission is of the self-contained, internal cone type, is protected from thrust stresses by ball bearings, and possesses the unusual feature of being lubricated from the motor through the hollow crank shaft. Directly behind it is a double universal joint having unusually large bearing surfaces, connection with the driving shaft being made through a broached flange on the universal coupling, which takes hold of the squared end of the shaft.

REAR AXLE HOUSING AND GEAR CASE —TORSION ROD SUPPORT (PANEL).

The change gear group, which is of the selectively actuated pattern, is mounted on the rear axle, within the same housing as the differential, and comprises, together with the axle itself and its anchorage, one

MOTOR, SHOWING EXHAUST SIDE

Digitized by Google

of the neatest arrangements to be found. The gears are of 1-inch face, and of the popular 6-8 pitch stub tooth contour, and run on ball bearings of the annular type. The highest speed ratio is obtained by direct connection of the driving line members, and a roller bearing mounting for the forward end of the secondary driving shaft as it is supported in the pocketed end of the line shaft, ensures alignment of the gear faces at all times. The bevel group comprises 4-pitch gears, of 1⅝-inch face, mounted on annular bearings, the driving thrust on the axle being taken up by the regular bearings, and on the driving shaft by a 1-inch ball mounted at the end of the secondary shaft in the pocket gear on the line member.

The drive to the wheels is of the floating type, 5-jaw dogs, taking hold of the outer ends of the wheel hubs, while the vehicle load comes entirely on the axle tube structure. The housing of the group is remarkable in that a single manganese bronze casting is made to enclose both the change gear and differential groups, as shown in the accompanying picture. Two cover plates, one over the rear of the differential and the other above the change gears, give absolute access to all bearings and moving parts, the mechanism, with the exception of the driving axles and lay shaft, being removable through the opening at the rear of the group, thus permitting the mechanism to be dismounted without the use of a pit, and without removing the body or otherwise dismantling the upper works. The axle and torsion tubes are of chrome nickel steel, as are the driving axles, and are securely fastened to the bronze housing member. The torsion tube extends the full length of the main driving shaft and is supported in a ball and socket hanger, riveted to a cross member of the main frame. This comprises a socket bearing in the hanger fitted with a bronze spherical bushing in which the end of the torsion tube is permitted to slide. The group is shown in the panel of the above illustration.

In this way the torsion strains due to driving are transferred directly to the frame in simple and effective manner, while the maximum amount of flexibility between the axle and frame and axle and transmission is provided for. The longitudinal thrusts upon the axle due to traction resistance, are absorbed by means of a couple of tubular distance rods, anchored to the frame. The brakes, which are of the external-internal pattern, are mounted on the axle tubes, and are both shod with camel's hair lining.

In the front axle, which is of I-section, and a solid drop forging, is a novel form of knuckle mounting in which the car load is taken up entirely at the top of the pivot, and by a single 1-inch ball. The manner in which this is accomplished, is plainly shown in the partial assembly view here shown.

Lubrication for the entire car is furnished by a Kinwood pressure feed oiler which takes care not only of the motor and commutator bearings, but also of the torsion tube hanger, and the rear transmission group. In addition to this, all important moving parts, notably the latter, are provided with grease cups.

In addition to the regular touring car, the Pennsylvania name also will be applied to a high speed roadster of the runabout order, which will have practically the same chassis as has just been described, but will mount a light aluminum body having seating accommodations for four. In this the angle of the steering column will be somewhat increased, and the general appearance altered to give a more uniform "rake" to the superstructure.

Reliable Dayton is Redesigned.

Entirely redesigned, and with a number of features which, it is claimed, never before have been employed in the construction of the motor buggy, although well known in motor cars of the more conventional type, the 1908 Reliable Dayton will be presented in two models, known as "E" and "F", to which later will be added a coupe and a delivery wagon. The principle alterations in type, as announced by the Reliable Dayton Motor Co., 15-21 N. May street, Chicago, Ill., consist in the mounting of the motor transversely in front, under the hood, instead of lengthwise of the vehicle and in the waist, the substitution of a sliding pinion change gear of the familiar type, and the use of rack and pinion steering gear with horizontal crank lever control. Another innovation, consists in the use of a wood frame.

Model E is a single seated buggy of the conventional pattern, but improved in appearance over that of last year by the rounding off of the corners and general softening of the outlines. It has 84-inch wheel base, weighs 1,100 pounds, and sells, without top, for $780. Model F, which is a surrey, possessing the same general specifications in other respects, has 98-inch wheel base, weighs 1,400 pounds, and sells, without the top for $925. The rear seat of this type is detachable, and when removed leaves a box suitable for light delivery purposes. An extra model, to be known as type G, also is forthcoming, which will be purely a delivery wagon. It will have an 18-20 horsepower motor, and a carrying capacity of 1,500 pounds.

As to the chassis mechanism common to both of the types under consideration, the motor is of the horizontal opposed form, with cylinders 4⅜ by 4 inches in measurement, water cooled, with thoroughly approved metals of construction used in every part, notably in the crank shaft, connecting rods and bearings, and rated at 15 horsepower. The radiator is of the tubular pattern with liberal continuous flanges, and the fly wheel is fitted with fan blades to assist in the circulation of air through the radiator and over the motor.

The change speed gear, which is of the progressive type, affords two forward changes of speed, the one giving a speed range up to eight miles an hour, and the other a range of from three or four to twenty-five. The higher gear gives a direct connection between the constricting clutch on the fly wheel and the counter shaft. The final drive is by double side chain to the wheels, the sprocket rings also mounting expanding brakes. The clutch is controlled by the pedal in the usual way, and the gears are shifted by means of a short horizontal lever mounted on the steering column just beneath the steering lever itself. The rack and pinion gearing of the steering mechanism, is enclosed in a grease tight case just beneath the right side of the foot board, the steering column being vertical and ending in a horizontal lever from one end of which is upturned a crank handle, while the other is fitted with a plain grip at the end of a shorter arm, steering thus being made possible with the use of either or both hands. The frame, which is of second growth ash, is liberally reinforced at vital points. The springs are semi-elliptical in front, and full elliptical in the rear, the length being 36 inches, each set having five leaves. The wheels are respectively 40 and 44 inches in diameter, shod with 1¼-inch side wire solid tires. Timken Roller Bearing axles are employed, the steering knuckles being of an original pattern, built extra heavy.

Two Rambler Models for 1908.

For next season the Rambler line will consist of but two models, Nos. 34 and 31. Both will be five-passenger touring cars, but No. 34 will have a 32 horsepower four-cylinder motor, selective transmission with shaft drive, 112-inch wheel base, 36-inch wheels, 4-inch tires, and will be listed at $2,250, while No. 31 will be provided with the Rambler double opposed motor and planetary transmission and will sell for $1,400. When desired, the big car will be fitted with roadster body and rumble seat and the other with roadster body and torpedo deck. The 32 horsepower car is now being given a rigorous test on Western roads being driven in company with a 1907 Rambler and the drivers being required to change cars daily in order that the new comer may be proven absolutely true.

Enterprise Checked by Detectives.

It often has been remarked that the best way for a young man to build his future and make money is to launch out into business for himself. Whether or not this is true does not matter, but the idea fixed itself in the mind of F. A. Higgins, an employee of the Auto Vehicle Company of Los Angeles. Higgins did not make money quickly enough to satisfy his needs, so he systematically began to stock his rooms with sundries and accessories. He had collected almost sufficient stock to advertise an "opening day" when detectives raided his quarters. The judge fined him $75.

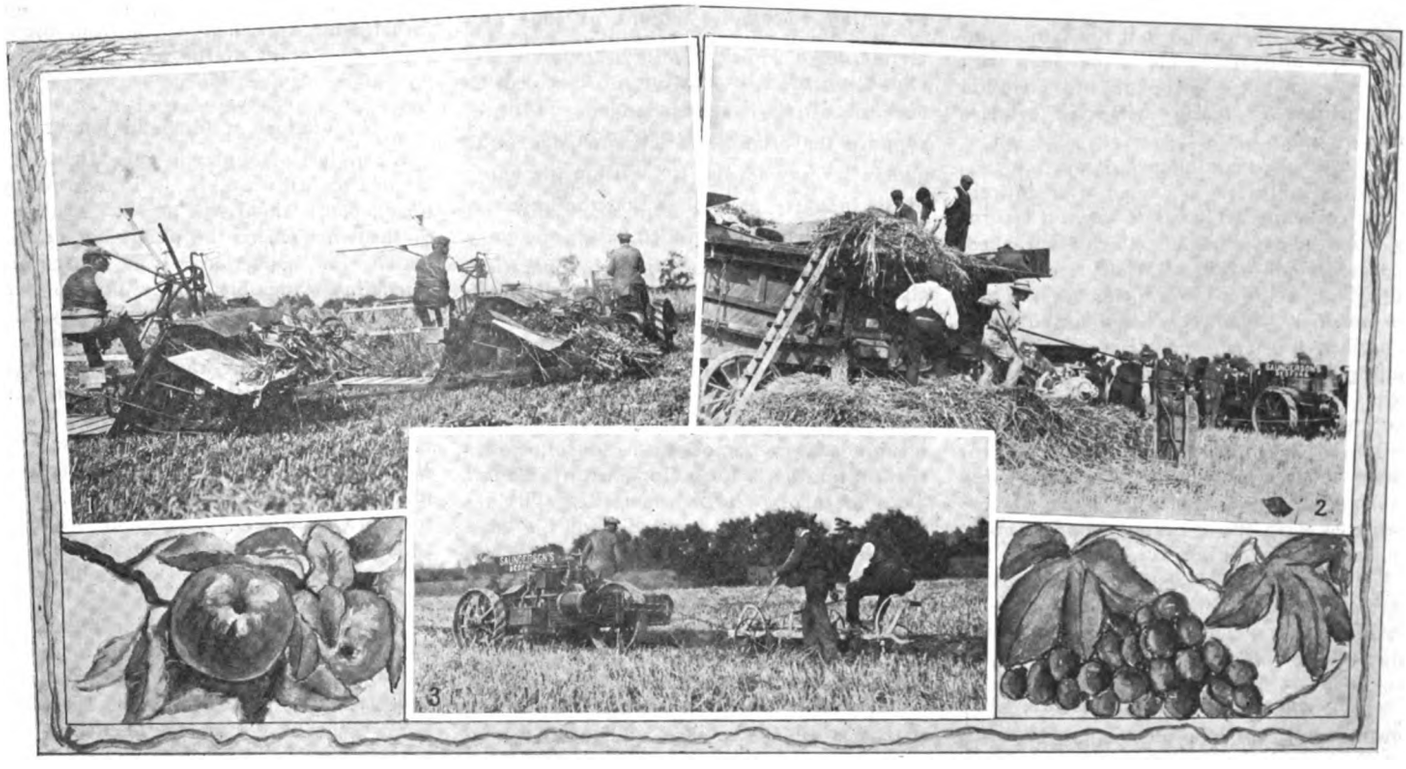
RAPID WORK IN MODERN FARMING



Wonderful Achievement with Gasolene Tractor—Only Seven Hours from Plow to Mill.

What is claimed as a record performance in motor farming, was recently achieved at Kirton, near Boston, Lincolnshire, England, when a gasolene tractor hauling or driving the various implements, carried out all the work incident to the turning, seeding and tillage of the land, and also the reaping of the grain and threshing and grinding ready for the market. The occasion was a test, held at the farm of Dennis Bros. The tractor employed was built by Messrs. Saundersons, of Bedford, and the thresher, drum, mill, cultivator, drill, and harrow, were all of British make, while the harvester was a Canadian importation.

Drawing two reaping machines, as shown in one of the above illustrations, an acre of wheat was cut, bound and sheaved in fifteen minutes. The same tractor, driven by a 50 horsepower motor, later supplied the energy for the threshing machine, which threshed and ground the product. In a subsequent trial, another acre plot was ploughed, drilled, harrowed and sown for a new crop, the entire cycle of operations being completed within seven hours—for which the record is claimed.

In addition to these experiments which were intended to attract attention to the possibilities of motor farming, in England, somewhat similar demonstrations have been carried out in France lately, a number of British inventions being employed in the fields at Chalous-sur-Marne.

The pictures furnish a clear idea of the way in which the tractor may be utilized for work of this sort, it being evident that in the ordinary work of the farm, as in drawing the plough, it is capable of replacing from two to four horses, doing the work at a more rapid rate, and without the requirement of any let up for feeding or rest. When it is further considered that the same machine, without alteration of any sort, also is capable of producing the power required for the operations of reducing the product to marketable form, and that on the ground, and without the loss of time and labor incident to hauling it to the mill, while the same device may later be employed to cart the grain to the shipping point, some idea of its universal applicability may be obtained. In this the gasolene driven machine is superior to the more common steam tractor because of its reduced weight, the great mass of the boiler required for the steam machine, rendering it useless for traction purposes except under the most favorable conditions.

1. TRACTOR DRAWING TWO REAPING MACHINES. SAME TRACTOR DRIVING THRESHING MACHINE
3. PLOWING, DRILLING AND HARROWING

Even Swap of Automobiles for Oxen.

While many transactions whereby live stock has been traded for automobiles have been recorded the opposite is so unusual that the occasion is worth noting. Supervisor Bigger, the davidharum of Jeddo, Mich., has just traded his three automobiles for a team of oxen, and opines that he made a "bigger" bargain.

LONDON'S MOTOR CAB SYSTEM

Terms of Employment Make Drivers Diligent—Cabbies Responsible for Injuries and Tires.

With the introduction of the motor cab into London, more or less difficulty arose in adjusting between the employers and drivers some of the minor points connected with maintenance and operation. In order to protect themselves against the wave of sharp practice and thievery which would have followed the simple hiring of the men on a wage or percentage basis, it was found necessary to adopt a special system which, in the case of the General Motor Cab Co., operating a large number of Renault cabs in the city, is working with more or less satisfaction all around, though naturally subject to more or less objecting on the part of the men.

In general, the drivers work on a 25 per cent, basis. That is to say, one-quarter of all their receipts for fares are their own, the company taking the remainder and stabling the machines, as well as cleaning them. To guard against waste of fuel and the inevitable tendency to theft, however, they do not provide the gasolene, but sell it to the drivers at a nominal rate, also renting them headlights where required, although the sort available are, as a matter of fact, useless in the city because of the restrictive police ordinances. In addition, whenever tires show undue wear the men are compelled to replace them, by which

Digitized by Google

means, economy of operation is enforced.

The matter of accidents is safeguarded by the manner in which the vehicles are insured against damage through accident. The $2,500,000 worth of insurance held on the cabs is divided among fifty-six companies, and the general restriction is enforced by the insurance concerns, that none of them shall be driven by men who have had more than three accidents. Consequently when a driver has had his third msihap he is summarily discharged, regardless of blame in the matter and, since all other operating companies are insured to some extent and in one or more of the same companies the ultimate result is that men with such a record are compelled to abandon the business in many instances, or else move to other parts.

The ordinary maintenance of the vehicles, as already indicated, is looked after entirely by the company. That is to say, on returning from the day's work, each cab is washed, inspected, and oiled, all that remains for the driver, being to clean the brasses and the interior. With every fare earned going in part to the men, and strict penalties attending carelessness or waste, the company is thus in a way to get the best possible service out of the machines, while the men have every incentive to careful and diligent work. Their wages are not high according to American standards, but rank well as compared with those of the London horse cab drivers, averaging as a rule, from $10 to $12 per week, exclusive of fuel costs and not including tips, which, as a matter of course, rank as clear gain and add to the value of the job.

Try-out of Chicago Chauffeurs.

Admiration for the mechanic who risks his life by accompanying the racing driver in his high speed contests is perhaps not out of place, but some of it should be reserved for the bravery of Chicago's civil service commissioners who have of late been undergoing somewhat similar experiences without the stimulus of racing ambition or of glory. These unhappy men, in the course of their official duties, have had to abandon themselves to the uncertain skill of automobile drivers applying for jobs as city chaufferrs. After telephoning their respective wives, physicians and lawyers, they have with faltering step walked out to waiting machines and left the results to Providence and the would-be chauffeur. The route selected for the try-outs was through Chicago's busiest streets, over the Rush street bridge and through the Loop district. Hair-raising as were some of their escapes, they have so far managed to get through with whole limbs, but with a firm conviction that they have earned all the money they will get for the next year. The tests for the chauffeurs include the two hour drive through traffic, the repair of several deranged cars, and a written examination on motor car parts and principles.

EDUCATION OF THE CAR OWNER

Thorough Information Necessary to Make Him a Safe and Sane Driver—How He Should Get It.

Oddly enough, as the development of the motor car comes on apace and trade and manufacturing interests acquire a better working knowledge of the mechanical side of the automobile, it becomes more rather than less essential for makers and dealers to outlay an ample amount of time and energy upon the instruction of customers in the use of their machines. This is true, because of the natural tendency to presuppose that rudimentary knowledge is as general everywhere as it is within the limits of the industry, as well as that the improvements in construction which have done away with so much of uncertainty in operation, also have eliminated the need of thorough comprehension of the mechanism.

What the amateur owner and driver requires is accurate and concise information, and his usual temperament makes it advisable that it be delivered in hand-to-mouth fashion and in homoeopathic doses, rather than in text book form along with the bitter aloes of theory and mathematics. The car forms a part of his recreation or his business life. Therefore it must come to him and with it his knowledge of its needs, in the easiest and pleasantest form. It is equally essential, however, that what he learns should be well learned, and should not be misleading in any way.

The driver should not simply be taught that it is unwise to race his motor, for instance, or to climb hills on too low a gear, but he also should be taught exactly why, and in such a way that he will remember the method of reasoning which leads up to the admonition, quite as much as the rule itself. Theories and principles should be given him only as absolutely necessary, and in such suggestive fashion as will lead him to investigate further for himself, if he be otherwise. Again, above all things, his training should be thorough as far as it goes.

Probably the most satisfactory and lasting way of teaching the learner is by the direct method of contact between instructor and pupil. To this end, demonstrators should be chosen carefully and taught their business carefully, in order to enable them to determine wisely just how much or how little real information, outside the mechanical process of driving, the beginner can and will absorb with profit. To supplement this, a certain amount of trade literature should be used, similarly chosen, quite as much with reference to the individual as to the presumed amount of primary gasolene knowledge which he possesses.

Those makers who are following along this line according to more or less elaborate systems of owners' schooling, are doing so wisely and with profit. It is impossible to lay too much stress upon the need of such training, nor of the requirement of thoroughness and system in carrying it out. Personal instruction of this sort may be made a very expensive item in the selling business. In certain ways it amounts almost to a pure gratuity to the customer for which there is naught but a "cumulative" return. But when it is considered that such training is quite as beneficial to the car as to the owner, and that in that way the outlay amounts to a direct and compounding investment, its actual worth from the personal standpoint of the maker himself can no longer be questioned.

No Visitors at Michelin Factory.

When it is completed, the Michelin tire factory at Milltown, N. J., is one manufacturing plant which will not be "written up" or thrown open to the public—or any individual—for inspection. It is a part of M. Michelin's inflexible policy not to permit visitors within the confines of any of his producing properties, of which there are four others, one in France, one in England and one in Italy; in fact, it is given out by those in position to know that on one occasion the Queen of Italy expressed a desire to witness the Michelin processes at the Turin factory, the heads of which wired for Mr. Michelin's permission, which was refused, despite the majesty of the lady. The American plant is said to be a duplicate of the one in Italy.

The Milltown property consists of about 80 acres of ground and included four five-story buildings, which had been used for manufacturing purposes by the International A. & V. Tire Co. M. Michelin decided to use these only for store houses and offices, and immediately began the erection of eight new buildings which duplicate the foreign plants.

On June 3d the contractors broke ground; seven of the new buildings are completed and the eighth will be finished very shortly. Machinery was sent from abroad and this has been installed and the company is now ready to begin manufacturing. The plant when completed will have about 8½ acres of floor space and it is claimed will be the largest tire plant in America. A new 2,440 horsepower plant, operating two 1,000 kilowatt turbines, made by Westinghouse, has been installed. In addition there is an auxiliary power plant of seven hundred horsepower.

The Pittsburg Automobile Dealers' Association has been incorporated with 16 agencies represented, and last week elected these officers: President, W. N. Murray; vice-president, W. H. LaFountain; secretary, A. L. Banker; assistant secretary, Alice E. Doherty; treasurer, G. P. Moore. It was decided to hold the next show in Duquesne Garden during the week of April 4 to 11.

ROAD ABRASION OF TIRE CASINGS

Analysis Made of Highway Dust Confirms Well Known Theories—Relatively Heavy Wear at Turns.

Considering the fact that tire casings are subject to a considerable and continuous amount of wear, it is no more than a natural conclusion that the rubber abraded from the tread surfaces must become intermingled with the road dust. Naught but the contemplative mind of an Englishman, however, would ever conceive the idea of analysing samples of dust taken from various points in a much frequented highway, for the purpose of studying the comparative effect of the highway upon tire wear under different local circumstances. This somewhat obtuse method of investigation, as persued recently, has nevertheless brought to light a point or two worthy of note as confirming certain very common and well known theories, albeit perfectly obvious ones.

Two samples taken from the Llanabar road near Barmouth in Wales, the one from a straight stretch and the other from a corner, yielded upon analysis respectively, .042 and .170 per cent. of rubber such as might have been ground from tire treads. This at once is accepted as quite natural, seeing that the greater percentage existed at the corner, the tendency to skidding, not to mention imperfect differentiation of the motive power on turns, and possible imperfections in steering layouts, readily accounting for a large amount of abrasion at such points. In addition, however, it was discovered that in the second sample were several fragments literally torn from the tread, thus showing that the destructive effect is in reality very great. One piece, the largest, was rectangular in shape, and ½ inch wide by ¼ inch long. The fact that the percentage found at the corner was more than four times that discoverable at the other point, where the road was perfectly straight, goes to show roughly the relation between tire wear on the straight course and on the turn—which is a distinct contribution to science, as far as it goes.

How to Test the Differential.

When it is desired to test the differential for suspected trouble, it is not enough to raise one of the driving wheels from the ground, or to turn one sprocket, in the case of a chain driven car, since the side tested may be in good order, while the other is more or less seriously affected. The only effective method is to release both sides, whether by raising the entire rear of the car or disconnecting both chains, and then, after letting in the clutch, turn the motor over slowly by hand, observing whether both ends of the differential shaft turn at the same speed. If one revolves faster than the other, or not at all, it may be taken that something is amiss. By blocking the one which turns freely, the amount of resistance to the motion of the other, as well as its nature, then may be determined.

Princess a Wholesale Owner.

Princess Elizabeth of Liechtenstein, whom all followers of the doings of royalty will remember as the youngest daughter of the Archduchess Marie Therese and a niece of Emperor Franz Joseph and whose beautiful castle at Stuhlweissenburg is one of the most delicatessen in South Hungary, has taken to motoring. Not wishing to attract undue attention or notoriety in her indulgence in this pastime, she has purchased 31 automobiles as a starter, and if she likes them will purchase a quantity. Meanwhile the little community of Stuhlweissenburgers are preparing to enter their claims for having "more automobiles per capita," etc., thus gaining for themselves the glories that such a reputation has to bestow.

Makes His Car Useful.

The use of the automobile for business traveling is well illustrated in the case of W. J. Dingee of New York and San Francisco, a capitalist who is heavily interested in the cement industry. Mr. Dingee divides his time between the East and West owning cement mills in Pennsylvania and California. He does all his traveling between his offices in the two cities and his mills in his 50 Matheson car. During the past few months he has been in New York and has made weekly visits to his Pennsylvania cement mills, using his car not only to travel back and forth, but to inspect the different mills, and forth, but to inspect the different mills son are now, however, on their way to the Pacific coast for a two months visit.

.. Thousands of Arrests Threatened.

About 6,000 automobilists are threatened with arrest by the Massachusetts State highway commission for not re-registering under the new automobile law. While many owners may have given up their cars and a good many others of the old registrations were of visitors who will not be touring through the State again, yet the commission is convinced that out of the 6,000 names that have failed to re-register there must be a very large proportion of residents of the State who are either careless or are wilfully ignoring the provisions of the new law, and a wholesale issue of warrants is expected to scare them into line.

Odd Wrinkle in Illinois Law.

Some advantage accrues to the married man in Illinois if his wife owns an automobile. In addition to getting free rides in a motor car by reason of his intimacy with the owner, he may drive the machine without a chauffeur's license. Some of the Illinois police did not see it that way until Attorney General Stead so decided a few days ago.

RUBBER UNDER VARIOUS NAMES

How the Gum Got Its Most Familiar Designation—"Caoutchouc" an Older One, but Restricted in Use.

The name "rubber" as a designation for a certain material with which readers are presumed to be familiar may be without high scientific warrant, but it has the merit of priority among English speaking peoples, and this fact alone has led to its use becoming more widespread than "caoutchouc" or any other term, whether more scientific or otherwise, remarks the India Rubber World.

The English designation "rubber" referred to a rubber-out of pencil marks before any one thought of the word "eraser," and while some other uses of the elastic material have become more extensive since Priestley's time, the name sticks; it is fairly well understood, it serves its purpose, it is easy to write and sperk, and the average man is too busy to consider a new name from any such consideration as that it may be more accurate or more fully descriptive

The French designation "caoutchouc" based upon a native Indian name up the Amazon, is older. And the Germans to a degree have borrowed the French name, but they also use "gummi" to a great extent. To-day "caoutchouc" is nowhere a word in common use in a rubber producing region except the limited areas under French or German control, and then only by supervisors and not by native workers. The word is in use in French rubber mills and to a slighter extent in the German. Compared with this usage the universal adoption of "rubber" wherever English speaking peoples have to do with the production or consumption of the material, gives this word a vastly greater vogue.

We notice that Continental firms introducing their products into English communities adapt the names of their firms to English practice by taking up the word "rubber," while English firms trading abroad are less apt to follow a corresponding course. Englishmen have been first to introduce rubber goods in many parts of the world, as later they have been first to introduce rubber goods in many parts of the world, as later they have been first to establish rubber planting on a practical basis, and the persistence of the names of the English (including American) companies alone seem likely to render the familiar word "rubber' ultimately the most widely used term.

Pennsylvania Tags in Yellow and Black.

Pennsylvania, which brings out a new fashion in automobile tags each year, has decided on the style for 1908. The new number hangers will be tasteful creations in yellow, with black figures.

RENEWING WORN BRONZE BEARINGS

Method of Filling with Babbit or Other Soft Metals—Their Selection a Question of Adaptability.

A curious and none too well understood relationship exists between the composition of shaft and bearing metals and the degree of satisfaction with which bearings will act under severe and long continued service. Without going into details further, suffice it to say that the percentage of carbon in the steel of the shaft, appears to be the determining factor, and that as a rule the so-called high carbon steels run to better advantage with the ordinary bearing metals, than do those of lower grade. Just how the relationship may be determined, or in what terms it is measured, is of less importance to the average user, however, than the fact that it exists, and that designers frequently make an unfortunate choice in specifying materials, with the result that certain much loaded bearings prove to be short lived and give considerable trouble.

Often it is the case that a bearing which has worn unduly or developed a tendency to heating, may be improved, if not wholly cured, either by altering the bearing surface by the substitution of new bushings, or by lining those already in place either with babbit, or some of the high-speed antifriction metals, of which several different grades may be obtained. As a rule it is fully as advisable to line or "pack" the bushings with a soft metal of this description, as it is to attempt to form it into a bushing, the bronze shell of the old bushing serving very well as a holder for the new material, and also working to no disadvantage if allowed to come into contact with the journal at the ends. In fact a bearing of this description, frequently is found to last much longer and to give even better results, than one composed entirely of the softer metal.

The process of renewing an old bearing in this way is by no means a difficult one, and can readily be carried out in any ordinary machine shop under the direction of the owner of the car, or by any mechanic who is accustomed to the usual methods of "running in" babbit linings. The split bearings, which are those most frequently affected, are handled in the same general way as whole bushings, only being "sweated" together before being chucked on the lathe for chambering out or the final turning process.

In either case the bushing is first centered in the lathe and chambered out through the center until only about 1-16 inch thickness is left in the shell to serve as a basis for the new bearing, the ends being left intact for perhaps 3-16-inch from the outside of the journal. The part being removed from the lathe, is then "tinned" all over the counterbore thus formed, exactly as in the sweating process. Afterward it is placed over a mandrel of the same size as the shaft it is to carry, and after being brought to a uniform heat sufficiently great to cause the tin on the inner surface to run, the new bearing metal is poured in, through the oil hole if possible, or otherwise, through a suitable "sprew" constructed about a channel cut in one side of the mandrel, when it will unite perfectly with the bronze of the shell, forming what is essentially a single piece. After being cooled and dressed, either in the lathe or by scraping, it is then ready for replacement in the motor.

In one or two cars, this method of bearing construction is used in the original bearings, while in the case of one foreign car the same principle is applied to the construction of the liners for the connecting rod bearings, which are thus permanently attached to the rod end and work, as it is claimed, with perfectly good results.

Wearing Gloves for Protection.

There is more wisdom than pride in the habit of many chauffeurs and demonstrators of wearing gloves while working over the mechanism, though it hardly would appear to be the case, considering only the ridicule of dyed-in-the-wool mechanics, or the simple dictates of cleanliness, which more often than not may be at the root of the matter. As one of them explained the other day:

"There is a certain liability to slight injury while working on the machine, such as the accumulation of small bruises and scratches. These are of small consequence in themselves, but when later, they are brought into contact with the brass surfaces of the levers, and possibly with more or less brass dust when polishing the plated parts, there is more or less danger of poisoning, which, in some cases may be attended with serious consequences. The ordinary mechanic, through long service, has acquired a calous in the palms of his hands, through which nothing short of a determined knife blade can penetrate. The average driver, however, doing little or no real hard manual work, gradually loses this tough integument, even if he once possessed it, and therefore is more liable to abrasions than the other. Hence there really is some little excuse for the "dude" habit, even though it may not be generally known."

Firemen's Queer Work in a Garage.

Just why it should be necessary in extinguishing a garage fire to chop out the spokes of all the cars in sight, hack the tonneaux and smash the steering wheels, was what Providence, R. I., firemen were called upon to explain after the blaze at the garage of the Providence Motor Car Co. The firemen pleaded innocent and the police are investigating.

TIRES IN JOB LOTS AT AUCTION

Final "Outlet" of Rubber Circlets of Uncertain Vintages—Closing Chapter in A Murray Street Romance.

The last sad chapter of the tale of the tires that were never sold, known under the sub-title as "The Biter Bitten, or the Stinger Stung," was enacted under the auction flag on Murray street last week. Great big beautiful automobile tire casings, as round as doughnuts and as hard as concrete, bearing the name of a rubber company that it would be difficult to find in real life, were sold to tight-wad bidders at about $2 apiece, when the expectation last fall was that these same casings would go like hot cakes to a credulous public at prices just under those for reputable tire makers' products.

Morris & Grinberg, dear to many purchasers of second hand cars as the Manhattan Storage Co., having decided to sell out that short-lived but odoriferous mushroom "The Manufacturers' Outlet Co.," which was advertised as having been instituted to "save" the cycle manufacturers from "ruin" but which prospered not when its operations and ownership were exposed, an auction was held to close it up. Conspicuous among the "joblots" were imposing stacks of "Majestic" automobile tire casings, reaching almost to the ceiling. The story of their birth and later sufferings was told in the Motor World last fall—how a certain obscure tire concern was induced to undertake the manufacture of an immense quantity of near-tires at a microscopic figure and how it delivered the goods, collected the cash and left its enterprising customers to their agony in discovering within a few days that the tires were turning hard and dark even before they could be disposed of to the "dear public." So great was the quantity that the plungers have since been unable to get rid of any great proportion of their purchase even by showing owners of second hand cars how they could improve the selling chances of their machines by fitting them with brand new tires at a low figure. At the auction on Thursday of last week, bidding on the unique circlets was so reticent that the auctioneer, after a whispered conference with Grinberg, finally proposed an arrangement to receive bids first for such "soft" tires as the high bidder might select from the whole pile, and then put up the leavings as another lot. Under this plan, the "soft" tires brought something like $8 apiece and the "hard" leavings, constituting by far the greater number, brought in the neighborhood of $2 apiece. Small as was the original price charged by the makers, $2 was so far below it that an ineffable sadness and anguish marked their disposal at that figure.

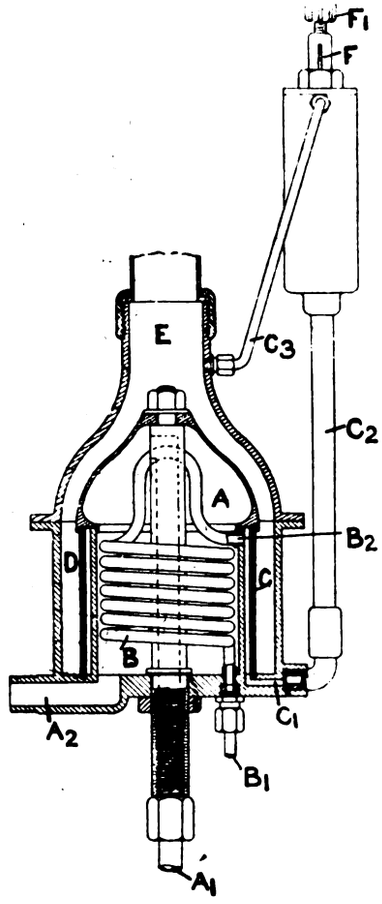
DEPARTURE IN CARBURETTERS



Unique Principle Applied in a New Device —Automatic Control by Fluid Shutter a Feature.

An entirely new principle in carburetter construction is developed in the Dentan, a device just introduced in Great Britain by Gosset-Tanner & Deane, in which is combined a method of surface vaporization with a system of automatic control which is as unique as it is novel. Briefly the principle is that of permitting the fuel to be drawn through a porous cup, somewhat similar in structure to those used in the construction of primary batteries of the two-fluid type, and regulating the amount of influx to the mixing chamber by varying the area of the surface exposed to the action of the motor suction. The radical feature, outside that of the method of vaporization, consists in the use of a column of mercury balanced by the action of the suction against a second column in an independent tube, and serving to exclude the fuel from contact with the walls of the porous medium, according to the height at which it is supported.

The arrangement, which mechanically, is extremely simple, comprises principally, a large jacket chamber, A, which is heated to any desired temperature by the circulation through it either of the jacket water from the cylinders, or a portion of the exhaust gases. The inlet and outlet connections for this portion of the device are at A1, and A2, respectively. The helical coil of tubing within the chamber, shown at B, serves as a conduit for the fuel, which enters at B1, and leaves at B2. About the lower and cylindrical portion of the chamber is formed a small annular chamber, C, enclosed by the outer wall of the first chamber and the cylindrical porcelain cup, mentioned above. External to this is the mixing chamber, D. The fuel is always in communication with the interior of the annulus, but in order to reach the mixing chamber, it must percolate through the walls of the cup, as will be apparent from the illustration.

A body of mercury contained in the external tube, C2, normally is permitted to flow down into the chamber through the port, C1, thereby excluding the fuel, and by its greater viscousity being retained by the porous wall of the chamber, C, instead of passing through it as the fuel would do. When the motor is running, however, the suction exerted on the upper surface of the mercury in the tube, C2, which is placed in communication with the intake pipe by the small tube, C3, causes a portion of the heavy liquid to be raised, thus lowering the level in the chamber, C, and permitting the fuel to take its place. In this way the mercury acts as an extremely flexible and sensitive diaphragm, rising and falling in exact response to the demands of the motor as manifested in its suction draught upon the mixing chamber.

The atmospheric component of the mixture is drawn in through the base of the mixing chamber where a number of orifices, D, give it free access at all times. In passing upward to the intake connection at the delivery pipe, E, it licks up the fuel exposed on the outer wall of the chamber, C, thus

vaporizing it and forming the mixture simultaneously. In this way, the device is broadly suggestive of the old-time surface vaporizers, yet not sufficiently so to in any way mar its revolutionary nature.

For purposes of regulation, a strangling valve, F, is placed at the top of the mercury tube, C2, where more or less air is admitted over the surface of the mercury, according to the position of the regulating screw, F1. In this way the height of the mercury shutter in the chamber, C, may be raised or lowered in relation to any particular degree of suction, the relative heights under other conditions, of course, remaining measurably constant. The purpose of the heating coil within the inner chamber, is that of raising the temperature of the fuel almost, if not quite, to the vaporizing point, before it is delivered to the chamber, C, as a result of which it is possible to use heavy oils or alcohol, as well as the lighter and more commonly employed motor fuels.

TIRE PRESSURE EFFECT ON SPEED

Edge's Third Series of Tests at Brooklands Track—Possible Bearing of Results on Future Design.

A third series of tests supplementing those which recently were carried out on the Brooklands track by S. F. Edge, have just been completed and apparently bear out the somewhat radical conclusion that tire pressure has little or no influence upon the speed of the car.

During the trials, the test car was timed over a flying quarter mile, equipped at different times with tires inflated to different pressures, the experiments including runs with two different sizes of tire, applied variously to the wheels. The car used was the 40 horsepower 6-cylinder Napier, and the tire pressures employed ranged from 35 to 100 pounds per square inch. The subject is of particular interest to the motorist because of the usual contention that high tire pressures are essential as reducing traction resistance, while low tire pressures tend to easy riding qualities in the vehicle. Should it be proved beyond a doubt that the low pressure tire absorbs no more power than its highly inflated counterpart, it is pointed out that a revolution in the methods of tire building may be involved in order to produce a tire which will wear well under the constant flexion which that condition involves.

For each individual test, the car was run around the track in order to establish uniform running conditions, and then was directed over the measured stretch and timed. Under these circumstances, the best time made, was 11⅘ seconds, corresponding to a speed of 76.27 miles per hour, and the slowest, was 12⅗ seconds, or a rate of 71.43 miles per hour. In the first instance 880 by 120 and 870 by 100 millimeter tires were employed on the front and rear wheels, respectively, and the pressures were respectively, 100 and 90 pounds per square inch. In the second, the sizes were respectively, 870 by 100 and 880 by 120, the pressures being 90 and 100 pounds in the two sets. Some differences existed in the combined weights of tires and wheels in the several cases, but oddly enough the difference did not appear in the result, although the actual difference of 15 pounds in the total weight of the equipment could hardly be enough to militate either way. The fact that the two extreme trials were made with the same equipment with the same inflation pressures, but with the disposition reversed, is, however, of some interest. In the fastest trial, the larger tires and higher inflation were applied to the front wheels, while in the slowest, they were applied to the drivers.

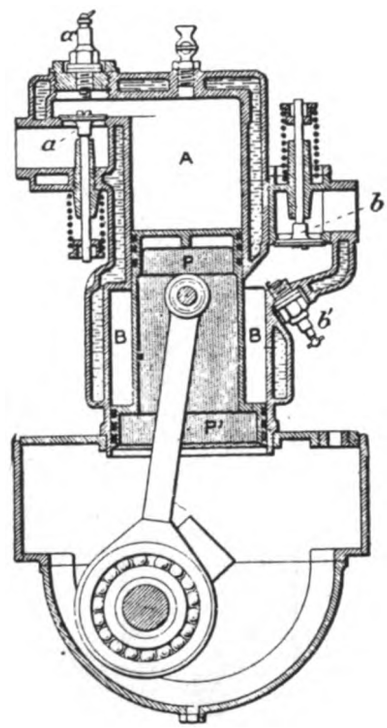
To facilitate changes, removable wire wheels were employed, several sets being used in connection with the tests. Thus,

Digitized by Google

while one set was being used on the car, another was being equipped and inflated in the manner desired for the subsequent test. Of the results, Edge is quoted as saying:

"The most astonishing results at first sight from these tests appear to be that the speed of the car was almost unaffected by the pressure of the tires, nor did it seem to make much difference as to the size of the tires.. The car seemed qually fast whether the tires were the 120 mm. to all wheels or 100 mm. to all wheels, or whether the air pressure in the tires was 35 lbs. or 100 lbs. Although these experiments at the moment appear to my mind to be quite inconclusive, they really lead us to one of the greatest moves forward that the automobile movement has had for some time, and if by further experiments it can be conclusively proved that a small air pressure in the tire is almost equally good from a speed point of view as a high air pressure, it then only remains for the tire manufacturer to see if he can make a tire which will wear well with small air pressures. If this is the case it means, then, that we should have our motor vehicles running upon exceedingly comfortable air cushions, as undoubtedly at the present moment, owing to it being desirable to pump one's tires hard to get the maximum wear out of them, we sacrifice practically all, or nearly all, the comfort that a pneumatic tire should give. * * *

"Then, of course, again the bulk of the horse power is being utilized to overcome the wind pressure at high speeds, so that even if a flat tire added ten or fifteen per cent. to the amount of effort required, it means very little reduction in speed, as it is only ten or fifteen per cent. of quite a small amount of the engine horsepower."



The first of the trials in this rather impromptu series, it will be remembered, dealt directly with the factor of wind resistance, and the second with the effect of car weight on speed. The comparatively insignificant effect on the speed which according to the results of this last test, result from differences in tire sizes and pressures of inflation, is directly in line with the theory that the bulk of the power expended in driving the car is put forth in overcoming the wind resistance. In this respect, the results correspond with those of the previous one. The results of the various runs are summarized in the following table:

	Tire Sizes.	Air Pressure.	Weight of Wheels.	Time for flying quarter.
Front wheels	870x100	90 lbs.	86 lbs. per pair	12⅗ secs. =
Back wheels	880x120	100 lbs.	111 lbs. per pair	71.43m.p.h.
Front wheels	870x100	50 lbs.	86 lbs. per pair	12 secs =
Back wheels	880x120	35 lbs.	111 lbs. per pair	75 m.p.h.
Front wheels	880x120	100 lbs.	113 lbs. per pair	12 secs. =
Back wheels	880x120	100 lbs.	111 lbs. per pair	75 m.p.h.
Front wheels	880x120	45 lbs.	113 lbs. per pair	12⅗ secs. =
Back wheels	880x120	35 lbs.	111 lbs. per pair	72.58 m.p.h.
Front wheels	880x120	100 lbs.	113 lbs. per pair	11⅘ secs. =
Back wheels	870x100	90 lbs.	99 lbs. per pair	76.27 m.p.h.
Front wheels	880x120	45 lbs.	113 lbs. per pair	12⅗ secs. =
Back wheels	870x100	40 lbs.	99 lbs. per pair	72.58 m.p.h.
Front wheels	870x100	90 lbs.	86 lbs. per pair	12 secs =
Back wheels	870x100	90 lbs.	99 lbs. per pair	75 m.p.h.
Front wheels	870x100	50 lbs.	86 lbs. per pair	12 secs =
Back wheels	870x100	50 lbs.	99 lbs. per pair	75 m.p.h.

TWO CYLINDERS COMBINED IN ONE

Construction which Produces Two Cycle Effect in Four Cycle Motor—New Adaptation of Differential Piston.

Motors that give an impulse every revolution for each cylinder are generally of the two-cycle type, but M. Boudreaux, a Paris inventor, has essayed the design of a four-cycle single cylinder motor that gives an

impulse every revolution instead of every other revolution. While in design his motor has but a single cylinder, in effect it is a two cylinder motor with but a single piston and crank.

This is accomplished by making the cylinder of two diameters and having the piston shouldered, as shown in the accompanying illustration. The upper section of the cylinder and piston are entirely normal, the novelty element being introduced in the provision of an extra set of valves, spark plug and other appurtenances necessary to make the lower section of the cylinder operative as a motor, independent of the upper section. Both parts of the cylinder operate on the four cycle principle, but instead of both being on the same cycle at the same time, they are arranged to alternate their power strokes, so that while the upper part, for instance, is on its power stroke, the lower part is on its suction stroke, and on the return, when the lower part is on its compression stroke, the upper part is on the exhaust stroke. Thus the one crank and piston serves to take the two sets of impulses, first from A, the normal diameter, and then from B, the larger one, operting on piston parts P and P-1, respectively. While the reports of the performance of the engine give no definite figures as to horsepower compared with weight, the results are described as being very satisfactory.

Light for Road Repairs at Night.

Where acetylene lamps having separate generators or using compressed gas, are employed, it is well to carry a few feet of flexible tubing in the tool kit for use in case of the necessity of making emergency repairs by the roadside at night. For this purpose the ordinary kerosene dash lamp while handily constructed, does not yield sufficient light to be of great utility, while many of the more sumptuously equipped machines are fitted with electric dash and tail lights, which, unless a supply of pliable cable is carried along, also are of no use at such times. For working about the tires or running gear, at night, it is of the utmost importance to have plenty of light, well regulated. For work upon the power plant, and more particularly, of course, the motor, the use of flame lights is more or less dangerous and should be governed with extreme caution. For this purpose, perhaps nothing is better than a pocket electric flash lamp, which though giving but a faint glow, comparatively speaking, is at least safe to use in the vicinity of a leaky carburetter.

New Pigment—or a Dream.

Indestructible paint for automobile bodies is a possibility if F. H. Austin, a scientific explorer, is not indulging in day dreams as to the character of a find he claims to have made while delving among the mysteries of some ancient Indian mounds in the Kern River oil field, in California. It is a hitherto unknown mineral substance which he believes is identical with the pigment of the indestructible colors used by the Egyptians and the North American Indians. United States government geologists to whom samples were sent for examination are said to have confirmed his opinion. Austin's account of his discovery is that he found around the neck of an Indian skeleton a string of beads formed from this material, which he calls "diatine." The beads withstood the test of chloroform and the heat of a red hot stove without injury.

JERSEY FARMERS SEE REAL RACING

Immense Crowd of Them Goes Wild Over Automobile Races at Trenton Fair—Parkin Captures Three Events.

New Jersey farmers changed from motorphobes to enthusiasts on Monday of this week, 30th ult. At least those who saw the card of automobile races at the opening of the great Interstate Fair at Trenton, forgot their antipathy for motor cars in the excitement of the moment and joined the throng of enthusiastic and demonstrative spectators.

In former years it has been the time honored custom to raise the curtain to New Jersey's greatest of fairs by a card of horse races. This year, however, the management thought to keep abreast of the times by opening with thrilling automobile races, and while the horse races may be held later in the week, they have been shoved in the dark background and the automobile contests brought in the limelight. It is impossible to estimate the exact number of people that saw the races on Monday. The fair management states that the attendance was greater by 5,000 than on any previous opening day, and the figures usually run from ten to fifty thousand.

The events all were exciting and the only amusing feature of the meet was the titles of the races. All but one of them were handicaps, and they included a "Mercer County Championship" and "Championship of New Jersey." As the meet was sanctioned by and run under the rules of the American Automobile Association, the body that is supposed to govern automobile sport in this country, has established a precedent in "handicap championships" that is most amusing.

Joseph W. Parkin, Jr., of Philadelphia, who with his father acting as mechinc, recently won a notable 100 mile race at the Point Breeze track, was the crack performer. He finished first in the "New Jersey Championship," the 25-mile open and the five-mile handicap for cars between $3,500 and $5,500. The Mitchell driven by William H. Sharp of Trenton walked away with the "Mercer County championship."

The only accident occurred in the ten-mile handicap when H. F. Greenwalt's Mitchell and a Stearns touched wheels on the first turn. The first named car went through the fence and out of action with a dented radiator and a bent axle. This event also resulted in the only protest, W. H. Sharp, Franklin, claiming that Parkin's Packard had fouled him at the lower turn. With a Packard, Stearns and Thomas on scratch the race was a good one for several miles. The three honor markers fought desperately until the Stearns had trouble and dropped back. The Thomas also slowed and Parkin went after the Franklin, Mitchell and Walter out in front. Then the Mitchell ran through the fence after being crowded and the Packard and Franklin entered the final stretch of the half mile track together, with the little car nosing ahead. Parkin piled on speed and passed, winning out on the tape by less than three lengths.

Frank L. Poth, of Philadelphia, in the Stearns, won the first event, an open handicap, which brought out four starters. The Thomas quit at the end of the second mile, and the Stearns, which had started from scratch, gradually pulled down the lead of the two long markers, winning over the Mitchell.

Sharp's Mitchell made good its handicap in the "Mercer County Championship" and with the Franklin, ran away from D. Walter Harper, Stanley, the scratch man.

More interest centered around the 25-mile open than in any other events, for just before the start the elder Parkin wagered what was announced as $500 that the Packard could beat the Stearns, and Poth, the owner of the latter, covered the bet. The Stearns, handled by Endicott, got the better of the start and led for a lap or two, when it stopped, leaving the Walter, with Edward Walter at the wheel, and the Packard to contest alone for a few miles. The Stearns got going again but the lead of the other pair was too great to be overcome before the gun and Poth had to be content with third place, and the losing end of the wager, Parkin beating Walter to the tape.

Owing to the threatening weather only 18 cars started from Philadelphia in the regularity run in the morning, for which the fair management had offered a valuable silver cup to the winner. The running time was 1 hour and 43 minutes. None of the competitors finished with clean scores, but the lowest penalization was that of F. J. Sweet's Stanley, which had one point charged against it. William Vail's Pope-Toledo and J. T. Moriarty's Stanley tied for second place with two points debit and M. F. Dobbins, Stanley, was third with a loss of three points. The summaries:

Five mile handicap, open to all stock cars—Won by Frank L. Poth, 60 Stearns (scratch); second, William Sharp, 18 Mitchell (0:55); third, H. T. Eisenberg, 12 Franklin (0:55). Time, 7:03⅗.

Five mile handicap, for "Mercer County Championship"—Won by William Sharp, 18 Mitchell (1:40); second, H. T. Eisenberg, 12 Franklin (1:40); third, D. Walter Harper, 20 Stanley (scratch). Time, 7:59.

Ten mile handicap, for "Championship of New Jersey"—Won by Joseph W. Parkin, Jr., Packard 30 (scratch); second, H. T. Eisenberg, 12 Franklin (3:00); third, Frank L. Poth, 60 Stearns (scratch). Time, 14:04⅗.

Five mile handicap for steam cars—Won by D. Walter Harper, 20 Stanley (scratch); second, J. T. Moriarty, 20 Stanley (scratch); second, J. T. Moriarty, 20 Stanley. Time, 7:26.

Five mile handicap, for cars listing at $3,500 to $5,500—Won by James Parkin, Jr., Packard 30 (scratch); second, Edward Walter, 40 Walter (0:25); third, Frank L. Poth, 60 Stearns (scratch). Time, 7:02⅕.

Twenty-five mile open—Won by James Parkin, Jr., Packard 30; second, Edward Walter, 40 Walter; third, James Endicott, 60 Stearns. Time, 36:31.

Tests for Women Chauffeurs.

Miss Katherine Lockwood, who once worked as a china painter in Los Angeles, is reported in Chicago looking for a job as chauffeur. She is ambitious to be the first professional woman chauffeur and is convinced that there is in the profession a bright future for self-reliant women. Miss Lockwood claims to have studied the mechanism of an automobile to such effect that she can get beneath a machine and make repairs as well as a man.

Of course it is apparent that Miss Lockwood believes other women can do just as she has done and can do. But her chief claim for woman's eligibility to the profession is her sobriety. "It would not make any difference in the safety of those in the car if they did dally with the booze," she says, "for I would be sober and steady at all times." That is all very well. At the same time, if women are to be examined for licenses as chauffeurs it would be necessary to introduce a mouse test. The usual effect of a mouse upon a woman is well known, and one of the little rodents might happen to get in among the impedimenta of a touring party. Then there are snakes; a woman's fright at sight of a snake caused an automobile accident last summer. If women are to be professional chauffeurs they should be able to stand the mouse test and the snake test.

Newark Club Plans Endurance Contest.

An ambitious project to hold a 24-hours endurance contest for stock touring cars over New Jersey roads is being fathered by the New Jersey Automobile and Motor Club of Newark. The scheme is yet in embryo and nothing definite will be decided until the club board of directors meets next week. It is planned to start the contest on a Friday, probably November 15th, and finish the following day. Just whether the promotors will disqualify those contestants who exceed the limit allowed by law or whether they will invite speeding and consequent law breaking is something that has not been made plain yet.

Hartford Gymkhana Declared Off.

Because the infield of Charter Oak Park is to be ploughed up and sown with grass the Automobile Club of Hartford will not be able to hold its gymkhana meet which had been carded for the 19th inst. A long and interesting program was arranged and several entries had been secured when the club learned of the decision of the track management to dig up the field upon which the events were to have been held. A postponement until nevt spring followed.

NOT A RESPECTER OF PERSONS

Commissioner Smith's Enforcement of Law In New Jersey—"Boss" McNichol Finds His "Pull" Worthless.

When State Senator James B. McNichol of Philadelphia, Pennsylvania's political "boss" wants to travel in his automobile between New York City and his home, it will be necessary for him to find a route carrying him outside of New Jersey. In that state Mr. McNichol, as an automobilist, is what the high-sounding language of diplomacy calls "persona non grata." The only number that state is willing just now to issue to him for his automobile is "23." So if Mr. McNichol would drive his automobile from Gotham to the Quaker City it would be necessary for him to take some such route at to Tarrytown on the Hudson; thence across the river to Nyack and on to Tuxedo and Middletown, where the route to Dingman's Ferry could be picked up, leading down the Delaware through the Delaware Water Gap to Easton; then direct to Philadelphia.

The reason for this roundabout journey of some 240 miles, if the Senator feels that he must travel in his automobile, is that he and the New Jersey Department of Motor Vehicles are at odds. The trouble began when the Senator recently made a trip to Atlantic City at a speed not recognized by New Jersey law except as cause for the imposition of fines or other penalties. Mr. McNichol being only a state senator and not a foreign diplomat there was no "lese majesté" in his arrest, conviction before a justice of the peace and condemnation to pay a fine. Appealing the case, he secured the return of the fine, on a technicality.

Then State Motor Vehicle Commissioner Smith took a hand in the matter and the Senator was invited to a seance with that official. The result was that the Senator's New Jersey license was revoked. A second hearing was given the Senator on account of his high public position, but Commissioner Smith could not be made to see the wisdom of restoring the license. Later, when W. J. McNichol, son of the Senator, made application for a New Jersey license, requesting No. 342, his father's old license number, the application was turned down on the ground that the application was merely a new move to reverse the commissioner's action. It was regarded as a variation of the Senator's plan for getting a new license under similar circumstances in Philadelphia, where he got one in his wife's name.

This evidently drastic treatment of an outsider is justified by the Jerseyites who endorse it by certain allegations to the effect that Mr. McNichol had charged corruption on the part of the officials who arrested him; had boasted that he was going to abolish what he called "the oppression of motorists" in New Jersey; and had tried to bring political influence to bear upon Commissioner Smith when the matter was before that official. It is admitted, however, even by some of those who regard Mr. McNichol as having shown a disposition to ride roughshod over New Jersey's law, that he has been made to some extent responsible for the ill-advised utterances of foolish friends who have inflated some of his own not overwise remarks. At the same time those who are willing to give him the benefit of every doubt charge him with adopting "boss" tactics of the ward-heeler type and in over estimating the strength of his "pull" outside his own State. It is said he supplied his personal cards to certain of intimates who purposed "hitting it up" in New Jersey, it being his impression that his name would be sufficient to cause any constable or policeman to take to the woods. The boss's friends are said to be looking for him now to administer a solar plexus wallop that will send Commissioner Smith through the fence, but it may be remarked that the commissioner is strong in the abdominal muscles.

The McNichol case is not the only one in which Commissioner Smith has demonstrated that he is no respecter of persons and that he means to apply the law without fear or favor. Although it is not generally known, he has not feared even to tackle a great New York daily, which boasted of sending a touring carload of its papers over the New Jersey roads at a mile a minute pace. He not only revoked the registration of the car and the license of the driver, but he notified the publishers that he would levy upon any of their property that might find its way into the State. Similarly he "went for" one of the non-resident tradesmen who made more or less noise about a fast run from Philadelphia to Atlantic City. Registration and license certificates were cancelled and the tradesman notified that not only would no licenses be granted to anyone in his employ, but that he himself would be arrested and his car sequestered the very first time he set foot on New Jersey soil. The culprit in question was extremely anxious to visit Atlantic City during the summer, but if he did so it was under cover of darkness or in a car not of his concern's manufacture. On another occasion an ambitious young man who let it be known that he purposed establishing a Philadelphia-New York record received word over night from the New Jersey commissioner that if he attempted anything of the sort he would find the police awaiting him and that it would be a long time before he again drove a car in New Jersey. The young man delayed the attempt, and dodging the cops he made a fairly swift trip, but he never boasted of it save in private, and his employers never advertised it.

FIGHTING THE BAY STATE LAW

Tyler Appeal Keeps the Islanders of Nantucket Busy—Ashfield's Closed Roads Give the Courts Another Case.

Frank J. Tyler of the Maxwell-Briscoe agency in Boston is giving the Nantucket people the fight of their lives in their war to keep automobiles off the sacred soil of their picturesque island. The Motor World has told of his invasion of the island with a Maxwell touring car, and of his being tried, convicted and fined.

An appeal being in order, the case has been carried up to the Superior Court, where it is now pending. Meanwhile Mr. Tyler has added to the agitation of the islanders by announcing that next summer he will establish an automobile bus line between the town of Nantucket and 'Sconset.

The matter has got into politics, also. In Massachusetts the people spend one half the year campaigning for the election of state officers and a legislature which is in session the other half of the year. Petitions to the legislature, asking for the enactment of a law which will be effective in keeping automobiles away from Nantucket have been in circulation on the island ever since Mr. Tyler's invasion during the summer just past. Would-be legislators are asked to commit themselves to it.

Nantucket has come to the conclusion that the existing law, ridiculous as it is, does not give towns the power it was supposed to confer. The case of Mr. W. V. Birney, preceding the Tyler case, and Mr. Tyler's pertinacious fight, have caused the islanders trouble and expense which they have not relished, and they want a law that will be open to no attack.

One of the chief grounds of the Birney-Tyler attack upon the law is the constitutional question involved in the exclusion of any particular class of vehicles from the public roads. This point, which will figure in the Tyler appeal is to be tested in another case involving circumstances which throw a flood of light upon the ridiculous features of the law to which the Motor World several times called attention. Arthur Kingsbury of Northampton was convicted in the District Court of Franklin, on September 27, of having driven his car over a "closed" road in the town of Ashfield, and was fined $10. Mr. Kingsbury had driven forty miles from Springfield to see an Ashfield man on a business matter. There were three routes to this man's house and every one of them was posted as closed to automobiles. Mr. Kingsbury chose the route that would take him over the least length of closed road, but nevertheless he was arrested. He has appealed the case, and will claim that the law is unconstitutional in that it obstructs travel.

1908

Announcement

E. R. THOMAS MOTOR COMPANY

1908

Every season the E. R. Thomas Motor Company adds something new, something progressive, something that departs from ordinary lines. This year is no exception. We enter the new season with a full line of cars, ranging from four cylinder, 20 horsepower cars, to six cylinder, 70 horsepower cars. The styles include runabouts, tourabouts, touring cars, cabriolets, broughams, landaulets, and limousines, a line varied and complete enough to suit every high class requirement.

One of the new lines is the 4-20 Thomas Town Car, designed by M. Gustave Chedru, of France. Runabout, brougham, landaulet, limousine and cabriolet and doctor's car bodies are fitted to these cars.

Town cars are required in every family. They have gained their vogue abroad and America now demands them. For women, in addition to park and suburban driving, they are a necessity for calling, for shopping, for theatrical and social functions. They are sure to take the place of the family carriage, having a radius of 100 miles per day instead of 25 for a horse-drawn vehicle. They operate more safely and economically and are simple and quiet enough for the most nervous to ride in.

For men, they will be utilized for business, carrying them quickly, quietly and safely between their city and suburban homes and their places of business, pleasurably and comfortably alike in fair, rainy or cold weather. For doctors the cars built especially for them will prove invaluable. They are always ready at a moment's notice for any call he may make on them. The center of gravity is low, preventing rocking and skidding and permitting easy ingress and egress. They are short to permit turning in narrow streets without stopping or backing. They are extraordinarily flexible and quiet—even the exhaust pipe being water-cooled to reduce noise. Their simplicity and the high efficiency of their mechanism, coupled with light weight, denote the most marked advance in automobile construction in years.

The 6-70 Thomas Special will surely take the lead in high powered six-cylinder cars. All the old substantial Thomas features have been incorporated and this car will astonish the most expert by its smooth and quiet running on high gear at the lowest and highest speeds or taking the worst hills and roads on high gear as smoothly and quietly as many well powered cars will on good roads without in the least taxing the mechanism.

The 4-40 Thomas Detroit is a marvel of lightness and smoothness. It has a dash and style in appearance and action that fascinates the automobile expert. With good wide, roomy seats for five—plenty of room, plenty of reserve power, plenty of fine finish, plenty of everything—it makes you wonder how, at the same price, we can afford to improve so much over last season and give so much more than any competitor in our class.

The answer is—We rely on decreased competition and greatly increased volume of business and have constructed a large, new concrete and steel, fireproof factory in Detroit to supply the increased demand.

Next is the Old Reliable Thomas 4-60 Flyer, the car that ran 21 days, 3 hours and 29 minutes, in zero weather and storms, on frozen, muddy and sandy roads without stopping the motor; that has won 75 per cent. of the contests it has entered and more world's records than any other car; that unquestionably won the honors of the Glidden tour, completing the entire distance, and then from New York to Buffalo overland, without raising the hoods, without mechanical adjustment, without involuntary stop of any kind, without any perceptible wear of tires, and with but three nail punctures on two cars, and were kept running in Buffalo for several weeks without raising the hoods or cleaning the cars—all this leaving them in as good condition as when they started.

The 4-60 Thomas Flyer has been redesigned by H. E. Coffin and Gustave Chedru, and though the cylinders and mechanism are practically the same, with the same power, the Flyer is miles faster, much smoother, quieter, lighter, roomier than ever. Though having great clearance, the car is lower and racier in appearance, having been changed to meet modern views.

Because of our great increase in facilities, we propose to extend our trade to territories hitherto neglected, and cordially invite all automobile dealers and users to visit our factories for demonstrations and inspection. Pamphlets and photographs will be sent on request.

E. R. THOMAS MOTOR COMPANY

MORE HILLS FOUND IN ILLINOIS

Rockford Club Celebrates the Discovery by Climbing Contest—Good Sport on Big and Little "Bumps."

Although the State of Illinois and the Desert of Sahara are nearly alike insofar as their flatness is concerned, the former has a few "warts" on its surface, which topographers evidently overlooked when they made their maps, but which recently have been discovered by exploring automobilists with hill climbing desires. One of these bumps was discovered at Algonquin where the Chicago Automobile Club has held two successful climbs and the other has just been found at Rockford by the automobile club of that place. To fittingly celebrate the latter discovery a hill climb was held on it Saturday, 21st ult.

Rockford's course consists of two hills—the "quarry" hill with a stiff ascent and a smaller grade. "Long" ones, they call them, the entire length of the course being 1,000 feet. However, some good sport was furnished for several hundred spectators and local partisans had opportunity to back their favorites with real spending paper. The cars were sent over the entire course and then two events were run up the shorter hill only. The best time of the climb was made by C. W. Yeager's Ford, in 38⅘ seconds. The summary:

Runabouts.

1 C. W. Yeager, Ford..... 0:38⅘
2 William Barnes, Ford 0:45⅘
3 J. Briggs, Reo 0:53⅘

Light Touring Cars.

1 H. Havens, Buick 0:45
2 James Rogers, Premier 0:49⅘
3 Sherman Letts, Franklin 0:58⅘
4 Duncan Rogers, Rambler..... 1:04⅘

Heavy Touring Cars.

1 William Barnes, Ford 0:41⅘
2 L. G. Harrison, Oldsmobile .....

High Gear Slow Race.

1 William Barnes, Ford 2:10⅘
2 H. Havens, Buick 1:28⅘

Special Slow for Steam Cars.

1 William Ziock, White 4:45⅘

Special Steam Cars.

1 William Ziock, White 0:47

Light Touring Cars, Four Passengers.

1 H. Havens, Buick 0:55⅘
Also ran—Duncan Rogers, Sherman Letts and James Rogers.

Runabouts—Short Hill.

1 C. W. Yeager, Ford 0:44⅘
2 J. Briggs, Reo 0:49⅘

Light Touring Cars—Short Hill.

1 H. Havens, Buick 0.43
2 James Rogers, Premier 0:45⅘

Tried to Run on Water.

Abbotsford, Ind., claims the distinction of having one of the most absent-minded men in the country. His name is F. A. Beard and he owns an automobile. The other day Beard stopped at a farm house to procure water to pour into the cooler, but absent-mindedly poured it into the gasolene tank. It was several hours before he discovered why his car wouldn't run.

Roman Roads Excelled by American.

That better roads and cheaper are built in America to-day than were constructed by the Romans and Carthagenians 2,000 years ago, was the assertion made by J. H. Dodge, road expert of the good roads department of the Agricultural Bureau at Washington, in an address before the fourth annual convention of the Indiana State Association of County Commissioners, at Indianapolis, last week.

"In those days roads were built at a cost of not less than $50,000 a mile," said Mr. Dodge. "Stone and gravel were put on to a thickness of three feet, and the builders paid no attention to grades and curves. They made great cuts through mountains and made enormous fills in places where a slight deflection would have taken the road around the expensive work. But these roads were easily worn down by traffic and wagon tracks made depressions in them. Hundreds of years later the depth of the road material was reduced to two feet, then to one foot and less, until now the United States Government is building roads and advising States and countries to build roads that are only four inches deep. And the results are better than in the olden times, because the foundation is better and is more scientifically constructed."

The speaker advocated the use of heavy road rollers as the most important and useful means of constructing good roads, reasoning that heavy rollers make the foundation solid and hard, a very necessary thing in road building. He also said that the oiled road is the most durable, oil preventing the road surface from being ground into dust and blown away. Gravel roads becoming worn and rutty, they should be repaired by spreading gravel in the depressions and rolling it with a heavy roller.

Sleeping Owner not Responsible.

That a person is not responsible for the actions of his chauffeur if the latter is asleep was the substance of a decision by Judge Wolfe, rendered in the Superior Court, New Haven, Conn., on Friday last, 27th inst. His decision freed a prominent Yale senior who was arrested when his car had exceeded the speed limits the day before. The constable who made the arrest testified that the college student and a girl companion were lying back in the tonneau with their feet upon the seats in front as if they were asleep. Such an admission was just the chance the lawyer for the accused was waiting for. He promptly moved that the judge dismiss the case on the ground that if the accused was asleep he was not responsible for what the chauffeur did. The motion was granted.

CLOSE FINISHES AT FREEPORT

Automobile Meet Enlivened by Motorcycle Events—Van Sickle Makes the Fastest Time of the Day.

Although the meet at Freeport, Ill., on Tuesday, 24th ult., was supposed to have been an automobile gathering with a few motorcycle events thrown in as an added attraction, it was the little two-wheeled vehicles that carried off all the honors and furnished the keenest racing. The weather was cold and clammy and as the automobile events were not well filled the spectators did not warm up to any great extent until they became interested in the close finishes between the motorcyclists. The fastest time of the day was made by Charles W. Van Sickle, of Hammond, Ind., on a motorcycle, who rode a mile exhibition from a flying start in the fast time of 1:16. The summaries:

Five mile motorcycle, open—Won by Charles W. Van Sickle, Hammond, Ind. (Indian); second, Lewis Dodge, Monroe, Wis., (Indian); third, F. F. O'Dell, Monroe, Wis. (Indian); fifth, C. W. Avery, Rockton (Harley-Davidson). Time, 6:42½.

Five miles, for stock cars—Won by E. L. Weiant, Buick; second, Fred Jastram, Ford; third, R. K. Farwell, Reo; fourth, Joseph Benston. Time by miles, 1:45, 3:34, 5:16½, 6:54, and 8:31.

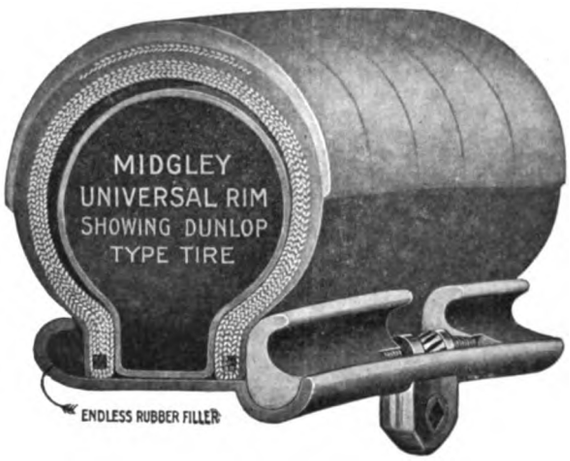
Three miles for single cylinder motorcycles—Won by C. W. Van Sickle (Indian); second, F. F. O'Dell (Indian); third, R. H. Comstock (Harley-Davidson); fourth, C. W. Avery (Harley-Davidson). Time, 4:19½.

Two miles judgment contest, 7 minutes—Won by Dr. Stephen Matter, 7:07; second, Dr. L. H. Matter, 7:10; third, Dr. Kryder, 6:45. Also ran—Farwell, Weiant, Wanner, Burrell, Schulz, Jastram, Hall and Benston.

One mile motorcycle exhibition, flying start—By Charles W. Van Sickle, Hammond, Ind., (Indian). Time, 1:16.

Three miles, novelty—Won by John Guyer; second, R. K. Farwell; third, F. A. Schulz; fourth, Fred Jastram. Time, 9:06½.

Two miles, double cylinder motorcycles—Won by Lewis Dodge (Indian); second, F. F. O'Dell (Indian). Time by miles, 1:28 and 2:46.



Three miles for runabouts—Won by Fred Jastram; second, R. K. Farwell. Time by miles, 1:53, 3:30, and 5:05¼.

One mile slow race—Won by Dr. L. H. Matter. Time, 12:45. Also ran—Weiant, S. Matter, Farwell, Burrell, Russell, Jastram and Kryder.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

The Week's Patents.

862,041. Circuit Maker and Breaker. John Wilkinson, Syracuse, N. Y., assignor to H. H. Franklin Manufacturing Company, Syracuse, N. Y., a Corporation of New York. Filed April 15, 1907. Serial No. 368,167.

1. In a circuit maker and breaker, fixed and rotatable elements, one element comprising a ring-shaped part of insulating material, contact pieces detachably seated in a circular series on an inner face of the ring shaped part, and spaced apart, and metallic bearing members detachably seated on said inner face between the contact pieces and substantially filling the spaces between said contact pieces, the wearing faces of the contact pieces and bearing members being disposed in substantially the same curved line and forming a substantially continuous hardened metallic path, and the other element having means coacting with the wearing faces of said contact pieces and bearing members, substantially as and for the purpose described.

862,063. Vehicle Wheel. James F. DeJarnette, Omaha, Neb., assignor to Eby Manufacturing Company, Omaha, Neb. Filed Oct. 1, 1906. Serial No. 336,818.

1. A vehicle wheel comprising a tire; a hub; resiliently mounted spokes extending radially from said hub to said tire; a series of inwardly extending guides mounted upon said tire; a series of rigidly mounted radially extending spokes upon said hub and having outer terminating ends; slot-forming housing boxes mounted upon said terminating ends of said rigidly mounted spokes, said housing boxes forming a lengthwise extending slot therein; said series of inwardly extending guides adapted to be seated with-fluid is maintained at a constant level, a feed outlet from said cup to said air conduit, said outlet having a feed nozzle within said air conduit and having its delivery end above the level of fluid in said cup, said air conduit having its area contracted adjacent the delivery end of said feed nozzle by means of an internal annular rib projecting inward from the wall of said conduit.

862,099. Device for Automatically Disconnecting Power-Driven Pumps. Axel L. Olson, Essex, Conn. Filed May 29, 1906. Serial No. 319,307.

1. The combination with a vehicle having a tire to be inflated, of a pump supported by the frame of the vehicle, said pump being independent of the wheels of the vehicle, an air conduit for supplying the tire with air from said pump, means including a rod for controlling the power operation of the pump, an air receiver connected with the air conduit, a piston in said receiver, and means whereby variations in the position of the piston due to the air pressure will shift the position of said rod.

862,100. Valve Mechanism for Internal-Combustion Engines. Lafayette M. Osborn and James E. Mannis, Topeka, Kan. Filed Feb. 2, 1906. Serial No. 299,073.

1. The combination of the outer casing provided with ports and the annular channels extending around the inside, a valve bushing having a partition and holes and leading to said respective channels, a cap, a hollow cylindrical puppet-valve having the holes to always form passage from port to the interior of said valve, and the hollow stem extending out through the cap and provided with a collar, a second valve seated at the open end of the cylindrical in said series of lengthwise extending slots formed by said housing boxes.

862,070. Adjustable Friction Belt for Automobile Tires. Emil Grieder, Woodbine, Iowa, assignor of one-half to E. J. Cole, Woodbine, Iowa. Filed March 23, 1906. Serial No. 307,624.

1. A friction device for vehicle cushion tires, comprising a flexible belt secured non-slipping upon the periphery of the tire, and having secured thereon at regular intervals a series of outer lengthwise and transversely curved bearing plates, and having terminal ends; each of said outer lengthwise and transversely curved bearing plates having secured thereon an outwardly extending friction lug formed with a transverse curvature, with reference to the friction belt; a lengthwise extending transversely curved plate secured upon the outer side of the flexible belt near one of its terminals and having a transversely formed slot therein, a lengthwise extending transversely curved plate secured upon the outer side of the flexible belt near its opposite terminal and having an outwardly extending transverse lug formed upon its outer end adapted to have a seating within said transversely formed slot.

862,083. Vaporizer for Explosive Engines. Charles I. Longenecker, Milwaukee, Wis., assignor to International Harvester Company, a Corporation of New Jersey. Filed Jan. 19, 1907. Serial No. 353,008.

1. A vaporizer for explosive engines comprising, in combination, an air conduit com-

municating with the engine cylinder, and having a substantially uniform area throughout its length a feed cup in which the motive valve being provided with a stem extending out through the hollow stem of the first valve and provided with a cap, a compression spring between the collar and the cap, and a compression spring between cap and the hollow stem, substantially as set forth.

862,250. Air Cooling System for Explosive Engines. Reinhold Herman, Crafton, Pa. Filed April 25, 1906. Serial No. 313,526.

In an automobile, a multi-cylinder engine, and an enclosing hood therefor having an intake in front of the engine and an air discharge in the back of the engine, the said hood being tapered at the rear of the engine and having an extension projecting beyond the tapered part, and the exhaust pipe of the engine being extended into said tapering portion of the hood and acting when the engine is working to create a constant current of air through the hood.

862,377. Explosive Engine. Frank W. Bacon, Omaha, Neb. Filed June 15, 1906. Serial No. 321,899.

1. In an explosive engine, an inlet valve having a tubular stem, an exhaust valve positioned within said tubular stem and controlling the passage of exhaust gases through the same, and means for actuating said valves at the proper relative periods.

862,465. Tire Clencher and Rim. George Lanoir, Washington, D. C. Filed Nov. 4, 1905. Serial No. 285,940.

1. In a tire retaining device, the combination of a rim, made in two parts, an inner member, an outer tire bearing member, said inner member consisting of a horizontal central part, and two general lateral parts; said member, consisting of a central horizontal part, equal in width to said part, and two semi-circular outer parts, terminating in lips, overlapping and adapted to slide on the edges of the upper curved parts, when said members are brought together, substantially as shown and described and for the purposes set forth.

862,414. Brake for Automobiles. Charles J. Roberts, Paoli, Pa. Filed July 5, 1906. Serial No. 324,890.

1. In a device of the character described, the combination of a beam associated with the body of a vehicle, said beam having a horizontal flange and a vertical web, a brake shoe disposed under said beam, links connecting said beam and said brake shoe and an extension on the forward side of one of said links at the lower end of said link, and an extension on the after side of one of said links at the upper end of said link, said brake shoe comprising a horizontal flange and a vertical web, substantially as described.

862,448. Explosive Engine. Gustave Cornilleau, Paris, France. Filed April 20, 1906. Serial No. 312,782.

1. Regulating mechanism for explosion engines comprising a rotary spindle, an adjustable inlet valve operating cam mounted thereon, an exhaust valve operating shaft, a cam thereon in combination with a controlling shaft for said inlet and exhaust operating devices, a connection intermediate the controlling shaft and the inlet operating cam spindle for adjusting the throw of the cam mounted thereon and a connection for longitudinally moving the exhaust operating cam shaft substantially as set forth.

862,556. Equalizing Suspension Device for Vehicles. Robert G. Handy, Bay City, Mich. Filed Oct. 25, 1906. Serial No. 340,531.

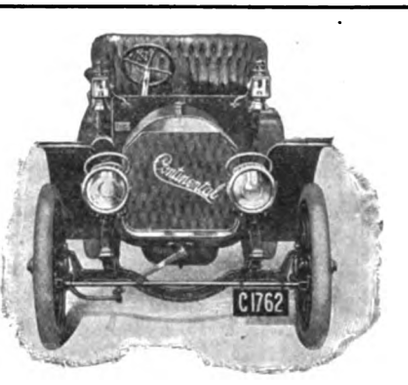
1. The combination with a frame, axles and wheels, of an equalizing suspension device comprising a pair of L-levers pivotally secured intermediate their ends to two opposite sides of the frame, the long arms of the levers crossing each other, links pivotally secured to the opposite ends of the axle, the free end of each long arm being pivotally connected to the free end of that link farthest from the point of connection of the lever and frame, and a spring connecting the free ends of the remaining arms of the levers.

862,563. Lamp Holder. John W. Kerr and Lucius A. Hine, Chicago, Ill. Filed Dec. 28, 1904. Serial No. 238,598.

1. A lamp bracket or holder comprising a fork whose members are rotatively adjustable upon a common axis with relation to each other to accommodate different sizes or forms of lamps, said members being adapted to be held against spreading by the lamp which they support.

862,682. Spring Support for Motor Cars. Johannus J. Vanden Bergh, The Hague, Netherlands. Filed Feb. 1. 1907. Serial No. 355,270.

1. In an arrangement of spring supports for motor cars, the combination of springs, an axle supported by means of such springs, levers hinged on bearings of the carriage frame and on the axle, rods hinged on the carriage frame and rubber springs arranged on the said rods between the frame and the hinged levers and consisting of rubber discs of different size and strength, substantially as described.



862,702. Wheel. Herbert F. Broadhurst, London, England. Filed Nov. 17, 1906. Serial No. 343,859.

1. A spring road wheel for vehicles, consisting in the combination of a rim portion displaceable transversely to the axle; a hub provided with check plates adapted to confine such displacement of the rim portion to movement of said portion in its own plane; guides integral with the hub and rim portions respectively and extending approximately radially to the wheel; and springs in compression interposed between the guides on the hub and rim portions and each adapted on the one hand to slide so as to offer no resistance to stresses transmitted in the plane of the wheel in a direction parallel to the respective guides, and on the other hand to offer yielding resistance to stresses transmitted in the plane of the wheel in a direction not parallel to the respective guides, substantially as described.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

WINTON

Ride Just Once in the SIX-TEEN-SIX and You'll Need No Other Logic

Let others debate about fours and sixes as they did about twos and fours. For your own satisfaction take just one ride in the new Winton SIX-TEEN-SIX. That will be enough to settle the whole proposition, for the SIX-TEEN-SIX does things, and you will not be happy until you have one doing these things in your own service.

Starts from the seat on compressed air. Flies or creeps on high gear, as you like, and goes the route like coasting down hill. Altogether charming in its beauty of appearance, and performance.

Until you have tried the SIX-TEEN-SIX you have not known the real joy of a real motor car.

Delivered to you fully equipped with five bow top, gas and oil lamps, gas tank or generator, horn, tools and glass front.

Output limited to 500 cars, making it the EXCLUSIVE CAR FOR 1908.

Exhibit of the SIX-TEEN-SIX now on tour from coast to coast.

We shall exhibit at the Madison Square Garden Show, New York, Nov. 2-9.

$2500 IN GOLD FOR TEN GOOD CHAUFFEURS

First Prize $1,000
Second Prize $500 Third Prize $250
Fourth Prize $150 Six Others $100

THE CAR BUILT FOR PERMANENCE

You're Sure of Your Trip

When you start in an American Mors you're sure of reaching the destined point without trouble or delay.

No matter what hills, what the condition of the road or other ordinary and even extraordinary automobile obstacles, the American Mors will get you there.

Every part of the American Mors is built to do a specific share of the work—and it does it.

No one part shifts the work on another.

They all work together harmoniously and make "the perfectly balanced car."

AMERICAN MORS TOURING CARS—THREE TYPES:

14-18 H. P., $3,000 24-32 H. P., $5,000 40-52 H. P., $6,000

All bodies of the most Perfect Designs—Complete Equipment

The tire that satisfies

Is it easy to make a good tire?—One that is tough, and yet resilient; absolutely secure, but easily manipulated?

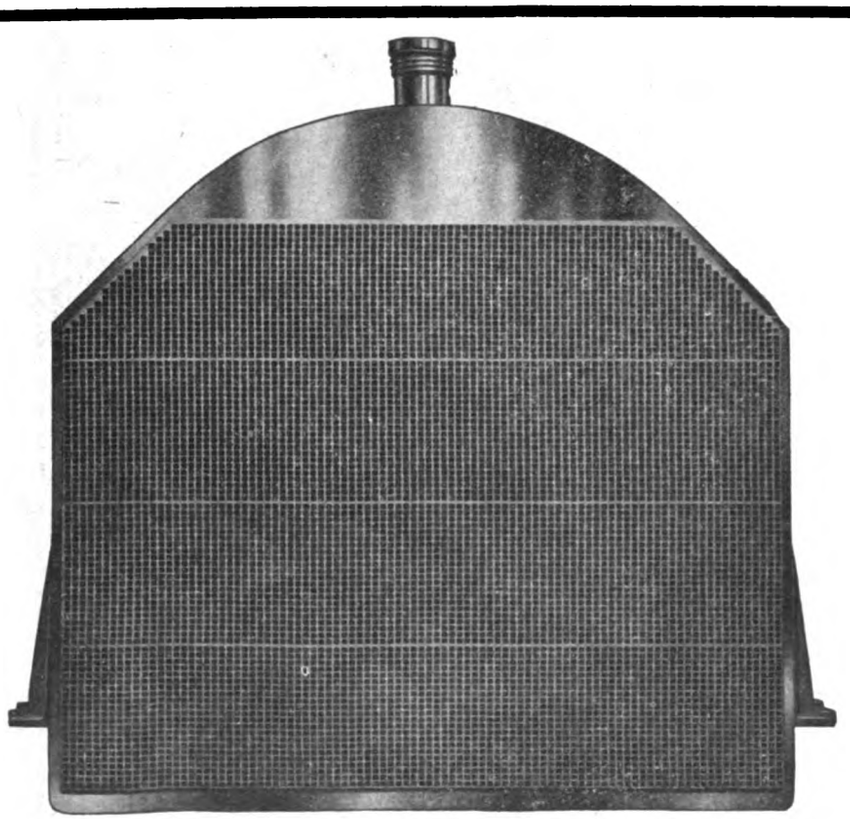
Money, brains, skill and years of experience are required to produce it.

As to the User

For the user but one quality is required—good judgment. Then he will specify

G & J Automobile Tires

They are at once the oldest and the best. If you are particular, insist on G & J Tires.



G & J Tires are provided with the oval raised tread or the Midgley anti-skid tread. Either the clincher or Dunlop type may be used interchangeably on the Midgley Universal Rim.

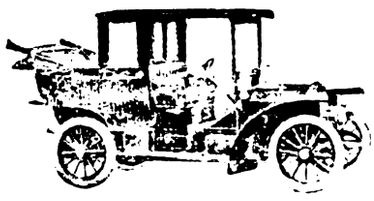
Matheson

Guaranteed One Year



Touring Cars, 50 H. P., $5,500

THE MATHESON is standardized. The few changes for 1908 are unimportant refinements. The great string of Matheson victories during the past season, its new speed records, hill-climbing records, endurance records, its perfect scores galore in reliability contests, made, not only without need of repairs, but without even adjustments, all these have repeatedly proven to us that there is no room for improvement in the Matheson. We have sought in vain for records of performance that would show the need of improvement of even a single feature. Feature for feature through the world's output of high powered cars, there is nothing that can compare with the Matheson for performance over American roads.

This means that the motorist who puchases a Matheson today will have, years hence, a car which will be running as strongly, as reliably, giving as efficient and as economical road service as any high class car then offered for sale. The Matheson is so strong, so swift, so powerful, so simple, so economical, so luxurious, so beautiful, so utterly without a peer, that no use of ink and paper can convey to you its greatness in entirety. Write for our new booklet, "I Drove My Matheson," by Matheson owners, some of whom have driven 5,000 mile trips at an upkeep cost of 5 cents—some for less.

I trust that you—whether dealer or prospective motorist—will make special note of

"The Maxwell"

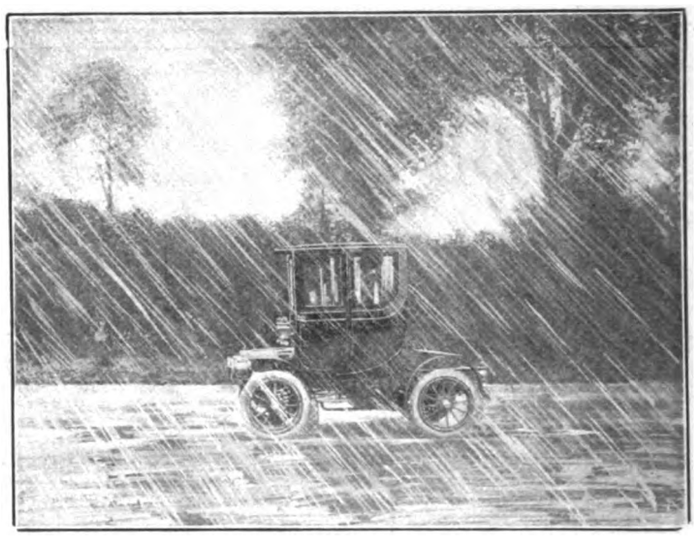
at the Grand Central Palace Show, October 24th to October 31st.

It is still just far enough away to make detailed announcements of models and specifications a trifle premature. But take my word for it—there will be only one car at the Show—the "Maxwell."

There's a big surprise coming off in the "Maxwell" line for 1908. You'll be the first to realize what a stunner it is when the actual announcement comes out.

Don't miss the "Maxwell" ad. just before the Show!

And don't miss the "Maxwell" exhibit at the Show!



You know the record the "Maxwell" has made; nobody has begun to touch it. And when you see the splendid line of "Maxwell" cars we have on the market for 1908 you will realize in a minute how securely we have blocked all possibility of rivalry either in power, details or price.

Meanwhile, if you want to arrange for a "Maxwell" demonstration at some particular time during the Show week, just drop me a personal note. I'll see to it. If you're a dealer speed spells profit.

Rain or shine its all the same in the Cadillac coupe.

$1350 F. O. B. DETROIT

THE IDEAL PHYSICIAN'S CAR.
THE IDEAL SHOPPING CAR.
THE IDEAL OPERA CAR.
THE IDEAL CAR

for any purpose where a two passenger enclosed motor vehicle is desired.

The Cadillac coupe comprises our regular Single Cylinder Chassis with an enclosed body.

It is suitable for every day in the year, warm or cold, rain or shine, for city streets or country roads. In cold or inclement weather the occupant is almost as well housed as he would be at his fireside. In pleasant weather the front and rear windows may be lowered and the side windows opened, permitting ample air circulation.

If desired, the coupe body can be removed and the regular runabout body substituted for use during the summer.

This

Cadillac

with its gasoline motor, has many advantages over cars using other methods of propulsion. There are no noxious odors. You may replenish the tank with gasoline almost any place and be on your way in a few minutes.

The Cadillac coupe is luxuriously upholstered and trimmed and richly finished both inside and out. It has every mark of dignity and refinement, with the pre-eminent Cadillac characteristics of thorough dependability and economy of maintenance.

Cadillac dealers can make prompt delivery.

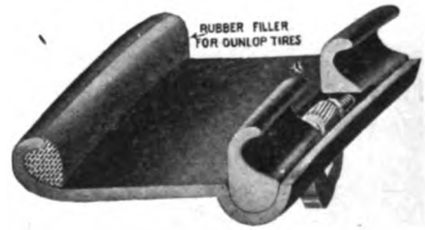
San Francisco: 423-433 Golden Gate Ave.
Portland: 86 Sixth St.
Seattle; Ninth Ave. and Pike St.

We want to emphasize that word "won."

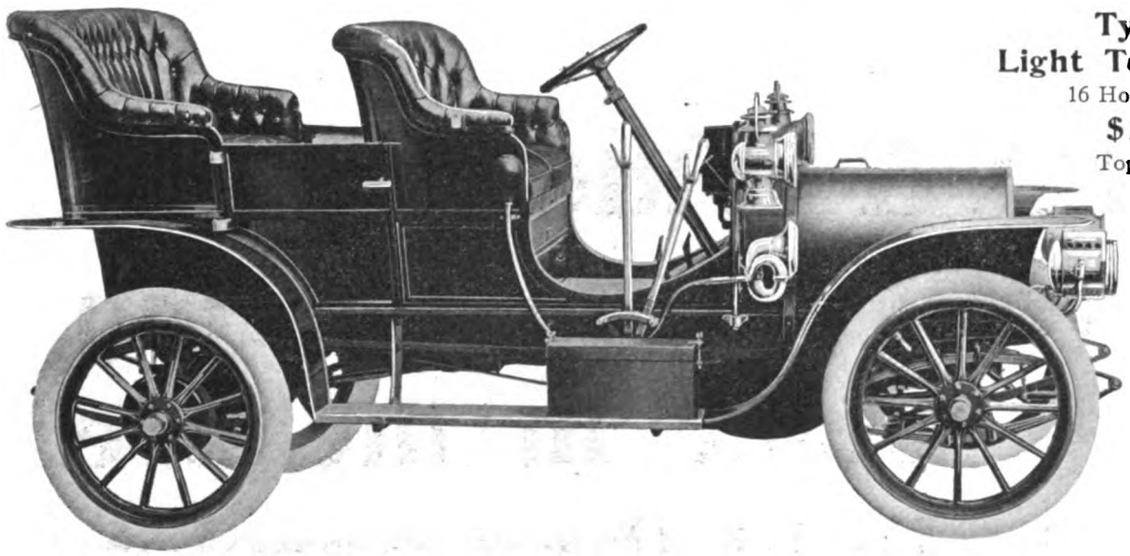


It requires an entirely different kind of a tire to win business than it does to secure it. It is one thing to sell a motorist one set of tires, but it is quite another—and a bigger—thing to sell him a second set of the same kind. Salesmanship may sell the first set, but merit must sell the second.

And it is by this merit method that MORGAN & WRIGHT TIRES have won their way to prominence in the "auto game."

Tough rubber stock, superior-grade fabric, our method of tire building, and perfect vulcanization—this is the "compound" that makes up into GOOD tires.

FOR CLINCHER



FOR DUNLOP
(Note rubber filler in clincher on left.)

The Improved Midgley Rim, illustrated above, accomodates every make of Clincher or Dunlop tires, as well as every type of mechanically-fastened tires, except one. Standard measurements thruout, including inside diameter. Solid bead.

Type G
Light Touring Car
16 Horse Power
$1850
Top extra.

Type G fills a niche all its own

Handy, speedy, able, economical, all at once—Franklin Type G (Touring Car or Runabout) is the most useful automobile ever built.

The wonderful new Franklin concentric valve and the other latest Franklin refinements give Type G 16 horse power which means more real working ability than goes with that rating in any motor car but a Franklin.

With all this power the G is snug in size and proportions, light weight, and manageable.

You can't overheat this Type G. It is a perfect example of Franklin air-cooling—doesn't even need a fan. And of course you never can freeze it.

The touring car is the ideal family automobile for city and suburban use. And the Runabout—swift, flexible and always ready—is the best adapted business Runabout there is.

Type G has the perfect strength that comes of highest-grade materials and scientific construction. It has the economy of light weight; the efficiency that won the Automobile Club of America's great two-gallon contest; the ability that holds the world's long-distance record across America; and has just created the wonderful new record from Chicago to New York in 39 hours 53 minutes.

As for style and appearance Type G is a motor car to be proud of.

Never was so much general utility built into a motor car before.

16 H. P. Touring Car $1850
16 H. P. Runabout $1750
28 H. P. Touring Car or Runabout $2850

"The First Real Successor to the Horse"

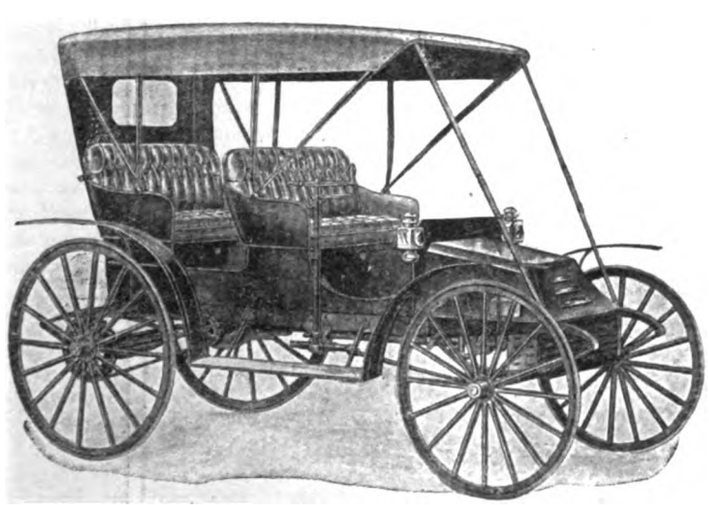
1908

RELIABLE DAYTON

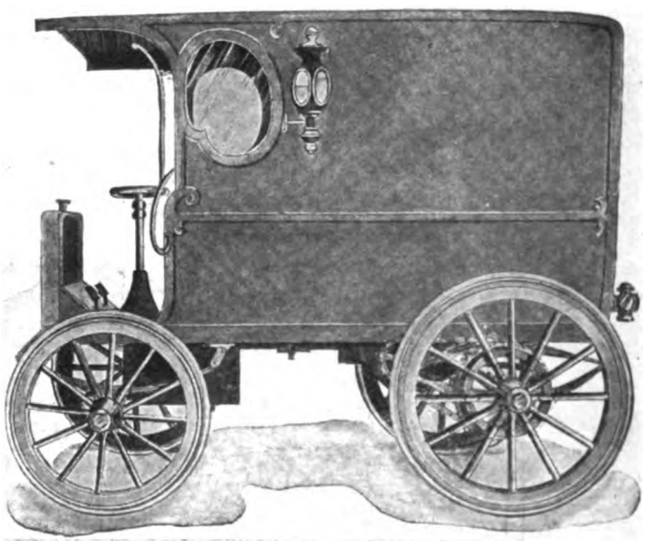
A Motor Car which adds to the reliability of the horse the luxury of speed; embraces the acknowledged standards of motor car construction combined with the road clearance of a carriage. The 1908 models include many features new to the carriage type of motor car.

Fifteen horse-power motor under the hood at the front; shaft drive to counter shaft; double chain drive to the rear wheels; sliding gear transmission; two speeds forward and reverse; transmission, bevel gears and differential together in one piece aluminum casting; wood frame of ash amply reinforced; rack and pinion steering device; no ropes, belts or pulleys.

RELIABLE DAYTON cars present the first practical solution of the motor car problem from both the standpoint of efficiency and economy. Tire troubles are abolished, tire maintenance reduced to the minimum.



Low in first cost; lowest in depreciation and longest in service—the car for the man who wants mileage for his money.



Four 1908 models as here illustrated. Descriptive catalog with full specifications on request.

New York Automobile Show, October 24-31. Chicago Automobile Show, November 30-December 7.

Rambler
Automobiles

For the year 1908 the entire facilities of the Rambler factory will be devoted to the production of two Models, 34 and 31.

Model 34, a five-passenger touring car with four-cylinder vertical motor, 32 horse power, has selective type transmission with shaft drive. The wheel base is 112 in., wheels 36 in., with 4-in. tires. Price, fully equipped, $2,250. The same chassis, however, with appropriate changes in detail, will be equipped with a roadster body with rumble seat, at the same price.

Model 31 is a five-passenger touring car with detachable tonneau, equipped with the Rambler unit power plant, comprising double opposed motor, multiple disc clutch and planetary transmission entirely enclosed. Price, fully equipped, $1,400. This model can be furnished with torpedo deck in lieu of the tonneau, at $1,300.

Both models have been brought to the highest possible degree of perfection in every detail that insures

Service, Economy and Comfort

A complete line of 1908 Ramblers will be shown at a private exhibit at the salesrooms of the Homan & Schulz Company, 38-40 West 62d Street, New York City, during both New York Automobile Shows.

You cannot afford to miss making a critical inspection of these 1908 models of

The Car of Steady Service.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, October 10, 1907. No. 2

IMPORTERS' SHOW ALL RIGHT

Denials of Rumors of Its Abandonment—Manager Mabley Says He Holds Final and Binding Contracts.

During the past few days, whispers, which had been in restricted circulation for all of six weeks, to the effect that the importers' show would be abandoned, have attained such strength as to become well defined rumors and the rumors have spread so rapidly that they have compelled notice.

But despite the discomfiting reports, some of which are almost cocksure, Carleton R. Mabley, manager of the Importers Salon, Inc., which has the project under its wing, poopoohs even the suggestion that the show may be abandoned. He stoutly affirms that it will be held in Madison Square Garden and on the dates, December 28 to January 4, originally selected.

"It's news to me," he declared, "that any such rumor should be around, because we are making every preparation. In fact we think it is going to be a show that will make the other shows look to their laurels."

J. C. Young, secretary of the Madison Square Garden Co., when asked as to whether there was any uncertainty of the show being held, said: "So far as I know it will be held at the time indicated. There are plenty of signed contracts in hand, and I believe there will be no difficulty in the financing of the affair."

A Broadway importer, when asked as to whether there had been any talk of dropping the show, said that he had heard nothing tangible to that effect. His firm, together with some others, had not as yet definitely taken space, feeling that there was plenty of time to do so later if it appeared desirable, but that the general assumption was that the show would be held.

Apparently, some of the whispers sprang from the fact that when the show first was arranged, the intending exhibitors were held only by conditional contracts, but Mr. Mabley stated that as the conditions imposed had been fulfilled, final and binding contracts since had been executed and were in his possession.

Aerocar to Reorganize and Resume.

C. A. Benjamin, general manager of the Aerocar Co., of Detroit, has not left the latter concern to go with the Ford Motor Co., as was announced by a hasty correspondent with an eye to inferences. Benjamin himself was in New York this week and so stated. The plant of the Aerocar Co. having recently been sold under a receiver, it is understood that the real purchaser, Alex. Malcolmson, who was the moving spirit in the original company, and several other men of wide repute, will reorganize the business, probably giving it a new name, and that Benjamin will have an opportunity to repeat the good work he did for the Aerocar Co. before internal dissension among the stockholders precipitated it into the receiver's hands.

Charley and Mercedes are Out.

Cables from Paris report that C. L. Charley, who practically was the sales agent for the Mercedes output, has severed all connection with the Mercedes interests. What may be his plans for the future is not made known. Charley, who was well known in America, is said to have cleaned up a million or more and is in position to "take things easy." His rise from a promotor of bicycle races to a position of affluence was rapid and as surprising as it was swift.

Shoemaker Removes to Elkhart.

Henceforth the address of the Shoemaker Automobile Co. will be Elkhart, Ind., instead of Freeport, Ill. The company has accepted the offer of the Indiana city and its machinery and other effects are now being removed to Elkhart and will be installed there within the next week. The Elkhart people supplied a factory building and $40,000 in cash in order to induce Shoemaker to become one of them.

LEAD THAT SANK SMUTZEL, INC.

Remarkable Cause of Failure of an Accessory Importer—Now He Will Sell the Complete Car.

Paul L. Snutzel, Inc., the New York importer of accessories, who "went broke" about a month since, has filed schedules showing liabilities of $10,606; his nominal assets are $4,040 and nominal assets have a bad habit of shrinking greatly in the wash.

Snutzel, however states that he will pay 100 cents on the dollar. Of his nominal assets, $2,207 is represented by stock, $750 by fixtures, $1,045 by accounts, and $47 and no cents by real money. The largest creditors are Mestre & Blatget, of Paris, to whom is due $3,419.

Snutzel went into the business of importing accessories only about a year since and his failure is remarkable only because of the unusual reason he giver. He says:

"The direct cause of the trouble was wholesale theft on the part of certain of our employees who abstracted spark plugs from packages and substituted pieces of lead. One customer in San Francisco notified us that he had received more than 300 chunks of lead in one shipment, and wired to ask if it was a practical joke. The total losses amounted to several thousand dollars, and on account of this fact and poor collections the concern decided to wind up its accessory business."

So far as is known, no arrests were made because of the thefts and Snutzel himself has found the failure small cause for embarrassment. He has given out that he has secured the American agency for a Belgian car and that he will sail next week to complete the details of the arrangement and to hurry shipments.

The receivers of the Grout Brothers Automobile Co. are offering for sale the plant and equipment at Orange, Mass. They first are inviting private bids.

San Diego, Cal.—Great Western Motor Co., under California laws, with $200,000; to manufacture and deal in all kinds of automobiles, machinery, engines, etc. Corporators—C. L. Brimhall, W. H. Hunt, C. E. Hunt, I. C. Brimhall, and Fred O'Farrell, all of San Diego.

St. Louis, Mo.—Moon Motor Car Co., under Missouri laws, with $175,000 capital, 75 per cent. paid; to do a general automobile business. Corporators—Joseph W. Moon, Stewart McDonald, Alfred F. Moberly, George H. Schelp, Henry C. Hopkins, and Louis F. Whitlock.

Looks Like Show War in Detroit.

E. Le Roy Pelletier, advertising manager of the Ford Motor Co., has been selected by the show committee of the Detroit Automobile Dealers' Association to manage their exhibition, to be held at Wolf's Auditorium, during the week beginning December 9. It is assurance that the function will not lack intelligent publicity.

Pelletier, who once was press agent for Thompson & Dundy, has been given carte blanche to carry out his own ideas, regardless of cost, and he promises something exceptionally artistic in the way of decorative and lighting effects. It is added that already dealers representing 53 different makes of automobiles have signed an agreement to not only exhibit at this show but also that they will not participate in any other, so it is very evident that there will be a conflict, "as it is expected that the managers of the former shows will run a sporting goods and accessories exhibit, as heretofore, particularly as the automobile dealers will not allow any accessories in their show," to quote Pelletier's first and two-edged announcement. As a matter of fact "the managers of the former shows" already have scheduled their "Tri-State Automobile and Sportsmen's Show" for February 10-15 and have again leased the Light Guards Armony for the purpose.

To Build Cars in California.

With a capitalization of $200,000 the Great Western Motor Co. of San Diego, has been incorporated under California laws and has acquired a two-story brick building—a former carriage factory—at Twenty-fourth street and National avenue in which will be built a car employing a two-cycle motor. The motor is the invention of C. L. Brimhall and W. H. and C. E. Hunt, who with I. C. Brimhall and Fred O'Farrell, all of San Diego, constitute the corporators of the company.

More Motor Buggies in Prospect.

John F. Waters, previously an official of the Federal Automobile Co., of Chicago, has connected with Rockford, Ill., capital and formed the Rockford Automobile & Engine Co., with capital stock of $50,000. Manufacturing facilities have been secured in the Talcott building. The vehicle to be produced will be of the solid tired, motor buggy type, which will be styled the "Rockford."

Hawley Company Elects Officers.

Officers were elected by the Hawley Automobile Co., Ltd., Constantine, Mich., last week as follows: President, W. L. White; secretary, W. M. Spencer; treasurer, S. B. Hagenbuch; directors, the officers, E. S. Hotchin, James Embley, H. W. Pidgeon and Dr. E. P. Bartlow.

Hillsdale Proud of Its Firstborn.

Hillsdale, Mich., is proud. The machine shop of Reek Bros. has produced its first "auto" and on its initial run it "showed up well." It is a single cylinder runabout of 15 horsepower, which it is intended to market at $450.

In the Retail World.

L. J. Sackett, latterly with the Simplex Automobile Co., has engaged with the Allen-Kingston Motor Car Co.; he will represent them on the road.

E. L. Nock Automobile Co., Providence, R. I., will build a new garage on Broad street, near Potter avenue. It will be one story, of brick; the dimensions are 101x52 feet.

G. T. Pushman has purchased the lot on Michigan avenue, near Twenty-fifth street, Chicago, and will build thereon a three-story brick garage. The lot measures 50x161 feet.

The Kohlhuss Motor and Parts Co. is the style of a new concern which has "opened up" as manufacturers agents at 1918 Euclid avenue, Cleveland, Ohio. Fred W. Kohl is its manager.

Isaac Shuler has moved into his new garage on Court street, Bowling Green, Ohio. The addition of a large passenger car for pleasure parties is a feature for Bowling Green convenience.

The Packard Motor Car Co., Providence, R. I., has leased the property at Washington street and Exchange place, and will open a new garage and salesrooms. It will be ready about December 1st.

The Dingle-Wetherbee Co., automobile dealers and repairers at 177 Berkeley street, Boston, Mass., has made an assignment for the benefit of its creditors. Robert A. Jordan and John T. Eno were named as assignees.

John G. Craig, treasurer of Wyckoff, Church & Partridge, New York, died at his home in New York on Friday last, 4th inst. He was 56 years of age and had been identified with the automobile business for about five years, having been the organizer of the Standard Automobile Co.

R. G. Howell, who previously was identified with Wyckoff, Church & Partridge, has formed the R. G. Howell Co., with himself as president and manager, and J. Z. Baten as treasurer. He has obtained the agency for the Northern car and will set up at 1657 Broadway, New York.

Frank L. Wirick, A. T. Bennett and Ralph Bennett have formed the Wirick-Bennett Automobile Company at Sioux City, Iowa, and will erect a large garage at Fourth and Nebraska streets. It will be two stories, of brick, 50x150 feet. Besides representing six makes of cars the company will conduct a livery and operate a line of sight-seeing wagons.

Alleging preferences and a confession of insolvency, three creditors have filed a petition in bankruptcy against C. A. Tileston & Co., Inc., who have been engaged in the retail business at 1776 Broadway, New York. The petitioning creditors and the amounts of their claims are Brewster & Co., $2,855; Norris N. Mason, $256, and the Atlantic Motor Car Co., $66.

AUGUST ANOTHER MONTH OF CHEER

Continued Gain in Export Trade—France Leads in Increasing Purchases—British Australasia a Close Second.

Foreign trading in American automobiles and parts continues to increase at the hopeful rate. The August returns from the Bureau of Statistics at Washington, emphasize the fact to a noticeable degree, no less than nine of the fourteen geographical groups recognized, revealing an upward tendency during the month reported. In these, the West Indies and Bermuda take the lead with an increase of $44,213 over the returns for August, 1906. France, with a gain of $30,135, and British Australasia with $29,513 following, with South America, Other Europe and the United Kingdom succeeding in order of difference.

In all, 256 cars were exported during the month, 28 more than during August, 1906, the average declared value per car being something like $1,300 less this year than last. The total gain in cars and parts together amounted to approximately $39,400.

Mexico, Other Asia and Oceania, and British North America reveal significant depreciations, amounting in round numbers to $69,000, $16,500 and $14,000, respectively. Italy and Africa also, figure in this class, to a small extent.

The summarized returns are misleading in that those quoted for 1906 are for six months, while those for the current year, are for the eight months, ending August 31st. Judging from the returns already published from month to month, however, it is safe to place the notable increases in business with the United Kingdom, British North America, and South America. The totals show an apparent gain for the eight months of $1,415,592, as compared with the first six months of 1906, and an actual increase for the eight months of $2,710,878, as compared with the corresponding period of 1905. The report in detail follows:

	August		Eight Months Ending August		
	1906	1907	1905	1906	1907
Automobiles, and parts of.....	.....	.....	$2,041,134	†$2,356,110	.....

* Number not stated prior to July 1, 1906.

"Special Nights" at Palace Show.

Special nights for special classes that are interested in the development of the motor car industry will be a feature of the Grand Central Palace show, New York, October 24 to 31.

Following the private view of A. C. A. members on Thursday afternoon, October 24, the opening day, there will be what is known as "Merchants Night" on Friday, October 25, when the prominent merchants of New York and vicinity together with the heads of their delivery departments will be invited to attend and view the machines exhibited, particularly those of the commercial type in which they are vitally interested. Saturday night, October 26, will be known as "City Officials' Night," when invitations will be extended to all heads of departments in New York City to view the cars in their autumnal setting. Monday night, October 28, will be known as "Engineer's Night," when the members of the principal engineering clubs, societies and associations will be asked to visit the show. Invitations will be extended to the Engineer's Club, the Society of Automobile Engineers, the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, the New York Electrical Society, and last, but not least, to the members of the Mechanical Branch of the Association of Licensed Automobile Manufacturers, the technical sharps of the rival show which will be held the week following the Automobile Club show. Tuesday night, October 29, will be "Society Night," while Wednesday night, October 30, will be known as "Military Night," when the heads of the Army and Navy and National Guard will be the guests of the Club.

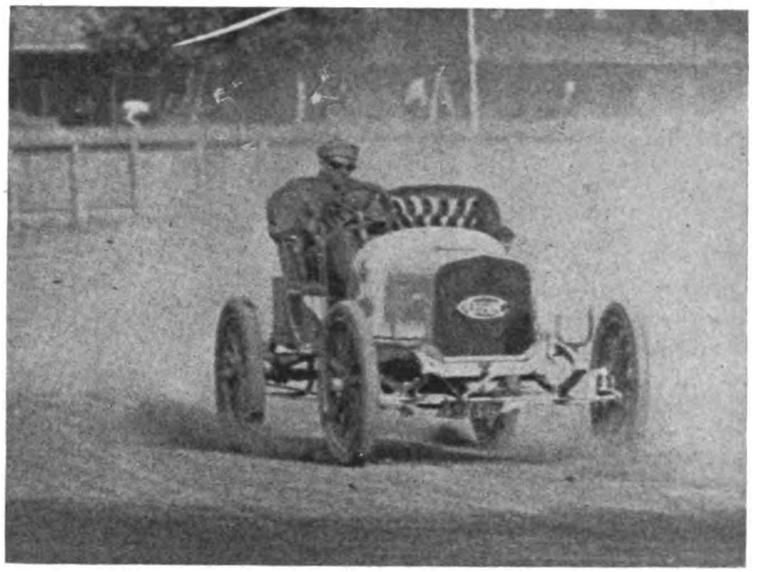
Invitations have been issued to these special classes and acceptances thus far received indicate a record attendance.

J. D. Porter has been appointed sales manager of the Wayne Automobile Co. Porter for a long time has been connected with the automobile press, which is to say that he knows the trade intimately and well.

REEVES ATTACKS "SEASON" SYSTEM

Folly of Putting a Year Tag on Models Shown up—How and Why It Hurts Business.

For the first time the question of giving yearly designations to motor cars, a subject which was treated rather fully in a recent Motor World editorial, has been given something of the discussion it merits at the hands of the trade. It remained for Alfred Reeves, general manager of the American Motor Car Manufacturers' Association, to "speak right out in meeting." The meeting, to be sure, was a very informal affair, being a luncheon to the New York representatives of the exhibitors at both shows by an hostelry seeking show time patronage, but it provoked some lively and illuminating views on the trade side of branding models by years or seasons.



After John T. Cutting had declared the shows this year were altogether too early, so early in fact as to directly interfere with agents' fall business and greatly to lessen the number of cars being sold, and some other New York retailers had given expression to their sentiments about nullifying the usual fall selling season by keeping the public in suspense concerning much heralded "1908" models at close hand, Reeves pronounced upon the growing absurdity of the general practice of manufacturers in fixing calendar dates on which to call all their previous products passé and out of date.

"At a time when the industry was very new," said Reeves, "it was a good thing to get up enthusiasm and interest by flashing a new and improved model for each year, but conditions have so changed and automobiles are so standardized that such a policy has not the justification or reason that it once had. No radical changes in automobile construction are now promised from year to year and any system which puts a stigma on machines created before a certain hour and minute, without regard to their merit or construction, is unfair both to the dealers who handle them and the people who own them. It is well enough to hold shows periodically for the manufacturers and the dealers to get together at one time and make re-arrangements of agencies and the like, but to emphasize the models by years or seasons is both unnecessary and unwise. As a matter of fact, the majority of the manufacturers will continue to make cars identical with those that have proved successful this year, with only slight changes in detail or refinement, yet many people will be deterred from buying during the present fall touring season, because they will want to wait for the so-called new models. Really new models are rare, and seldom coincide with the New Year."

THE MOTOR WORLD

Published Every Thursday by

The Motor World Publishing Company

Joseph Goodman, President. R. G. Betts, Treasurer.
F. W. Roche, Secretary.

154 Nassau Street
NEW YORK, N. Y.

TELEPHONE, 2652 BEEKMAN.

Subscription, Per Annum (Postage Paid) . $2.00
Single Copies (Postage Paid) . . . . . 10 Cents
Foreign Subscription $4.00

Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to THE MOTOR WORLD PUBLISHING CO.

General Agents: The American News Co., New York City, and its branches.

☞Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, OCTOBER 10, 1907

The Motor World's Show Numbers will bear dates October 24th and 31st and November 7th.

Show Situations, National and Local.

Although the early shows were designed for the benefit of the manufacturers, reports from those in position to know state that not a few of the intending exhibitors apparently have failed to realize the fact and are in an alarming state of unpreparedness. This is to say that their new models are so far from completion that some very hasty or strenuous work will be necessary if they are to be staged at the national exhibitions. In some quarters there exists undisguised apprehension that old models may outnumber the new ones. The matter also entails the point which the Motor World has made on previous occasions, i. e., that, once purposeful, the designation of cars by the years of their manufacture now is a drawback and serves to make the automobile business a "season business." Like the shows themselves, the practice leads the public to expect a new model each year and purchases are delayed or lost in consequence, and old stock thus is accumulated and ultimately sacrificed.

A situation of the sort was not wholly to have been unexpected. "Forcing the season" always is attended with difficulty and it well may be doubted that it serves any really permanent or far-reaching purposes. However desirable may be an early show of parts and fittings, it is reasonably certain that whatever advantages an early exhibition of completed cars may hold for the manufacturers, it is extremely probable that they will prove to be advantages gained at the expense of the retail trade, in other words, it is likely to further shorten a selling season already too short.

The most astonishing feature of the whole situation is the manner in which the promoters of local exhibitions have played "follow the leader" and succumbed to the early show fever. How an exhibit displayed in November or December can prove of any real benefit to the retail trade is beyond our understanding at any rate. Local shows are supposed to be for the purpose of awakening local enthusiasm to the point of increasing local sales, and how a function held when the snow is on the ground and likely to stay there for three months, and when most people prefer to hug their firesides can materially serve that end is difficult to comprehend. Any enthusiasm aroused by such a function is more than likely to dissipate in thin air long before the roads have "thawed out" and the air has lost its sharp bite. About the only persons who will purchase at an early local show are those who would purchase any way; they merely will then place their orders to insure early deliveries, which will make January, February and March appear very much duller than has been the case. The influence of approaching spring weather, which is the chief influence that serves to create new buyers and that is stimulated by and makes local shows worth while, will be almost wholly lost.

With the truth so very obvious, how any collection of hard-headed dealers can bring themselves to the contrary state of mind is impossible to decipher. Early local shows are merely mortgages on the present at the expense of the future, and not very desirable mortgages either. It is not too late for promoters of such affairs to turn back and if they are wise they will lose no time in doing so. Nothing is to be gained by painting rainbows or by chasing them.

Development of the Town Car.

It is in the nature of a happy augury that some attention finally is being turned toward the development of the so-called town car. Of course, such cars long have existed in the electric types but only a stretch of courtesy will permit the term to be applied to any of the existing gasolene vehicles.

If a stray coupe or two be excepted, the runabout with the buggy top and rain apron is the nearest approach to anything of the sort and it is not very much better than a makeshift. The person who would purchase a closed or semi-closed or convertible car has had practically only a Hobson choice—a limousine or nothing; and limousines necessarily are big, heavy, powerful and expensive. The limousine is but an enclosed touring car and while the term "touring car" is alluring and has served highly useful purposes, it is an open question if the industry has not suffered from an excess of such vehicles coupled with a riot of surplus horsepower.

Probably it is too early to unequivocally make the assertion but it is not improbable that, however slight, the trend toward town or suburban cars may prove a parting of the ways which may lead to a better state of affairs. Cars of the sort suggest more than fair-weather utility and with their general adaptability, their lightness and their moderate rating of horsepower they should appeal strongly to a very numerous class to whom limousines are impossible or to whom racy-looking rigs loaded to the nozzle with horsepower are suggestive of such speed and danger and general bedevilment that they are undesirable and are the last things with which a man of family would trust his womenfolk.

The development of the light, moderate-powered, all-weather car is but another finger post pointing to the direction which, as the Motor World has previously remarked, the automobile industry must travel—the well trodden and clearly marked route followed by the carriage trade to a fixed place in the world's affairs. The future is now the subject of most serious concern to very many of those engaged in automobile manufacture and to all such men the history of the very much older and

Digitized by Google

more firmly established industry, and also of the newer bicycle business holds much that should prove in the nature of if not a safe guide, then at least the safest guide that is available. Very many who would have poopoohed the suggestion but a few short years, have but to turn back a few pages of their books to discover some very illuminating and helpful truths.

Dealers and Their Customers.

One of the most difficult relationships to define and preserve is that existing between the manufacturer and his agent or dealer, on the one hand, and the individual buyer, on the other. For the well being of any industry, it is essential that a spirit of friendly co-operation, even of partnership, be established, through which the producer is enabled to keep in touch with the result of his own efforts, as well as to learn the temper of his market in order to keep abreast of the times in the way of improvement; while it is equally desirable for the consumer to be brought close enough to the source of supply to get the best possible service out of the product, as well as to improve upon it by renewal of parts or complete refitment, as the case may be, for the sake of economy. In fact, the need of such an acquaintanceship is economic from both points of view, and almost equally important to both parties.

One essential difficulty which bars the way to a complete relation of this nature results from the way in which advantage is taken of it, and in the automobile industry especially, it is the case that wherever a maker or dealer stands ready to render every possible assistance to his customers, he is put to considerable loss of time, some money and a great deal of patience in order to maintain the position he has assumed.

The owner of a small car who is continually bombarding its maker with questions as to how this or that part should be adjusted, how much it would cost to install a bigger engine, or a bigger body, or to put on tires or lamps of a different size, or who visits the agency several times a week in order to obtain "points" on the maintenance of his machine, is a familiar pest. Worse than the fact of his existence is the fact that he must be treated with at least nominal courtesy, as otherwise, he is certain to secede and carry his troubles and all the inside information he has been able to borrow and steal, to some less, or more, fortunate rival. Closely akin to him are the man who is forever trying to graft new parts on an old guarantee, and his friend who advises this improvement, or that one, the only fault of which is that it is absolutely impracticable in every way.

The customer who assumes the full weight of responsibility for the manufacture of an entire line of cars, and the one who makes a club house of the agency where he purchased his one poor little wheeze of a car, along with the chronic kicker, are the indegestible portions of the food upon which the maker and dealer have to live. They are more or less a necessary accompaniment of it, and—to change the simile—have to be nurtured with all the care that should have been given the goose which laid the golden eggs. To do so, involves much of diplomacy and tact, in addition to the three other qualifications suggested. Just how to manage them and how to divide the burden which they constitute between the maker and agent, are problems well worth careful solution. Whatever the outlay involved in securing and maintaining their friendship and reliance, as well as that of their less troublesome fellow users, is to be regarded as a legitimate outlay, however, and as a bond paying cumulative interest.

It is a pleasure to note that the Motor Age has so far recovered from its violent attack of hysteria, as to be able to discern that it is wiser that track racing be governed than that it be thrown to the dogs and permitted to exist without check or regulation of any sort. Meanwhile, we earnestly hope our Chicago contemporary will "throw a fit" over the football situation. On Saturday last not less than three young men were killed and five seriously injured in the pursuit of that sport.

Photographs recently received in this city appear to show that the American Ambassador to the Court of St. James uses a French automobile. Somehow there is something about diplomatic service abroad that has a queer effect upon the patriotism of Americans. It is well known that one former representative of the United States so far lost his love for his native country as to declare it unfit for a gentleman's residence and he is now a blooming Britisher in all except nativity. The Hon. Whitelaw Reid probably has no inclination in that direction, but it would seem that to a man of his training the wisdom of representing his country in all things would be broader diplomacy than mere ambassadorship. America produces excellent automobiles and there would be something akin to a display of patriotism for an American ambassador to do his automobiling in a machine made in his native land, in the products of which he is at least supposed to take pride.

COMING EVENTS

October 12, Rochester, N. Y.—Rochester Automobile Club's annual hill climb at Penfield Dugway.

October 12, Newton, Mass.—Bay State A. A.'s gymkhana games.

October 12, Chicago, Ill.—Chicago A. C.'s postponed race meet at Harlem track.

October 16, Birmingham, Ala.—Race meet at State fair grounds.

October 18, Middletown, Pa.—Motor Club of Harrisburg's race meet at Middletown track.

October 26, Allentown, Pa.—Race meet at fair grounds track.

October 24-31, New York City—Automobile Club of America's eighth annual show in Grand Central Palace.

November 2-9, New York City—Association Licensed Automobile Manufacturers' eighth annual show in Madison Square Garden.

November 9-16, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show at First Regiment Armory.

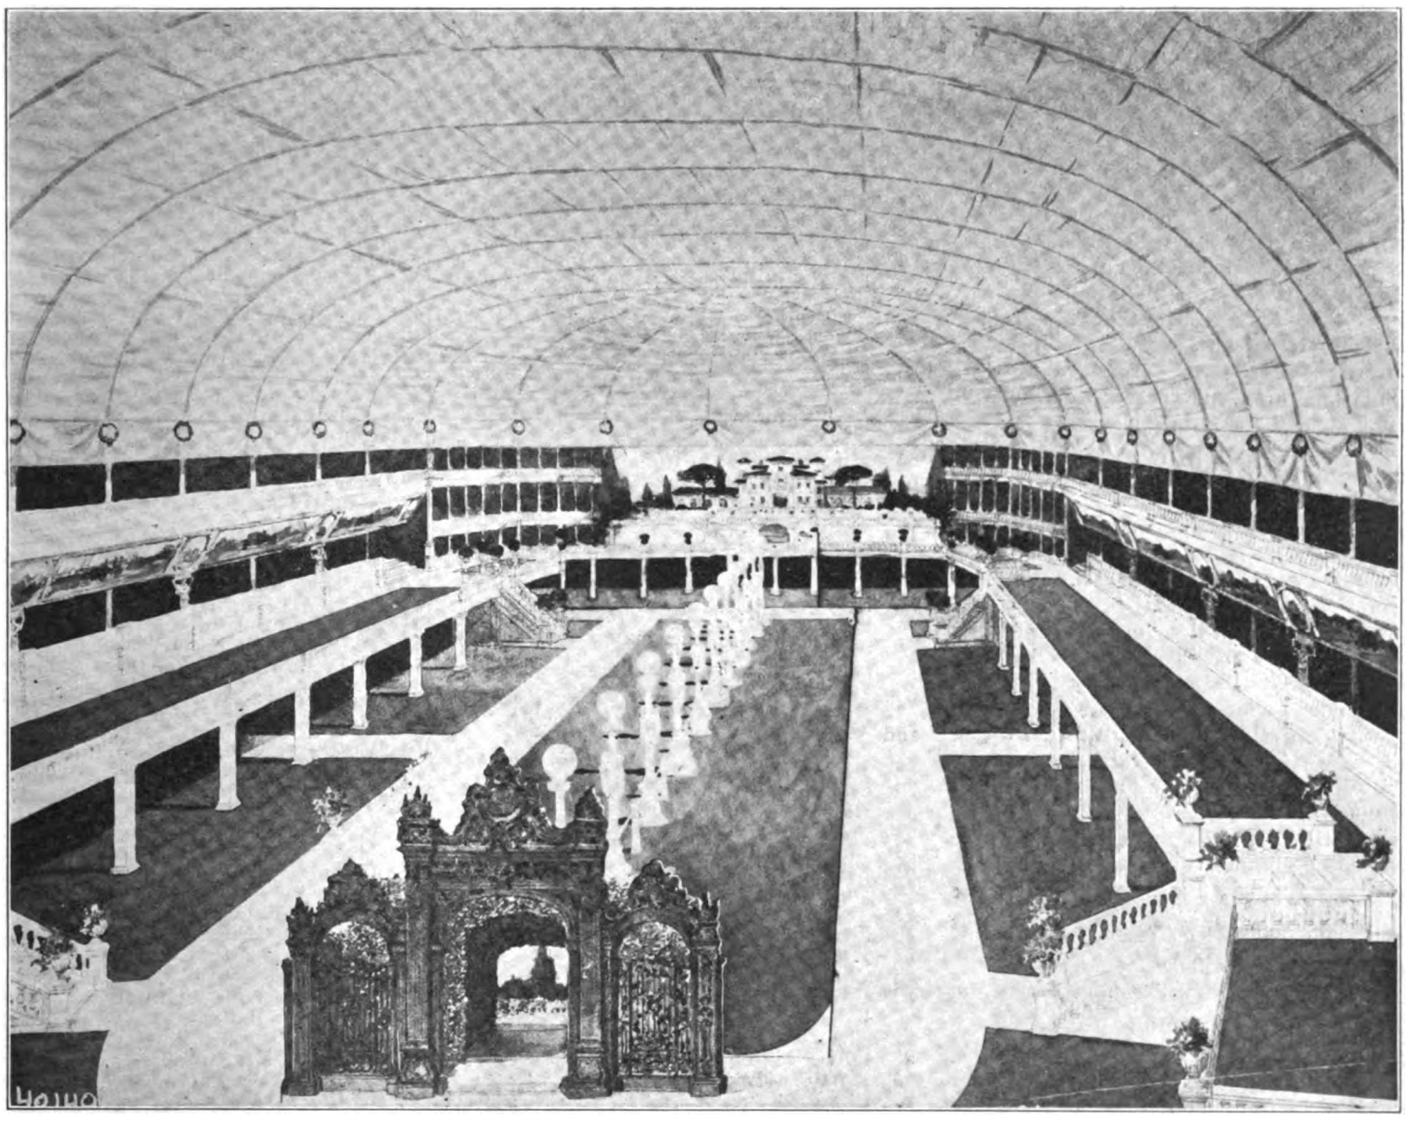
November 15-16, Newark, N. J.—New Jersey Automobile and Motor Club's 24-hour endurance contest.

November 26, 27, 28, Chicago, Ill.—Chicago Motor Club's three days' 600-mile reliability run.

November 30-December 7, Chicago—National Association Automobile Manufacturers' first annual exhibition of commercial motor vehicles in 7th Regiment Armory.

November 30-December 7, Chicago—National Association Automobile Manufacturers' Annual show in Coliseum and First Regiment Armory.

December 9-14, Detroit, Mich.—Detroit Automobile Dealers' Association's show at Wolff's pavilion.



February 10-15, Detroit, Mich.—Tri-State Automobile and Sportsmen's Association's show in Light Guard Armory.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association show in Duquesne Garden.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's show.

ITALIAN VILLA EFFECT FOR GARDEN SHOW

INTERIOR VIEW OF MADISON SQUARE GARDEN SHOWING DECORATIVE PLAN

Not Switzerland, as was the case on the last occasion, but Italy, will supply the setting for the Association of Licensed Automobile Manufacturers' show in Madison Square Garden, New York, November 2d, to 9th; and there will be much less of Italy than there was of Switzerland. There will be no star spangled sky, and while there will be statuary and other staff-work, there will not be so much of it. While the accompanying illustration will serve to convey a general idea of the decoration plan that has been adopted it cannot, of course, carry any true suggestion of the beauty of the coloring. If not so ornate as on previous occasions, in the language of the official word-painter, the "simpler setting means a gain of spacious effect and out-of-door feeling and will serve to lend more lustre to the gems of the automobile industry."

The color scheme is to be gray and crimson and white. There will be no starry sky overhead, but the girders of the big dome will be screened by a canopy of soft material, rich, warm gray in tone. The exhibition spaces of the main floor and elevated platform will be carpeted with a specially woven fabric of deep crimson, with the visitors' aisles between sharply set off by the gray material. Entering from the foyer, the visitor will be confronted by a towering gateway, a replica of one at the Florio Toresca villa in Florence. Back of the real iron gratings of this gate way, will be visible a garden wall with trees and shrubbery behind. While on canvas, this garden will have a literal perspective of seven feet, for the gateway structure has just that much depth. Beyond this entrance piece will extend the main display space, a broad path of rose hue, between the side aisles, with a row of ornamental pillars, fourteen feet in height, crowned by lamp globes extending along the middle. In the distance, at the Fourth avenue end, the vista will be that of Italian villas with terraced gardens of their own. This view will be presented by an immense painting, such as was used last year to mask the tiers of boxes and rear walls.

The plan of having the elevated platform above the arena boxes project slightly over the main floor and of covering the high rear seats so as to make a sort of mezzanine floor, will be repeated, but the idea has been extended and the lines of the Garden are to be further obscured and more space gained by decking over the first balcony, so as to have the flooring extending beyond the balcony railing and over lapping the elevated platform. For the edges of the balcony, the platform and mezzanine floor,

Digitized by Google

special railings have been designed, which, like the lamp and sign pillars, will be finished in pure white. In the general view, these railings of the platform, mezzanine floor and balcony will rise in three rows at the sides and the downward and backward slope from the balcony railing to the supports will be dressed in the gray and crimson. The stairways from the main floor to the platform will be white, with the newel posts supporting ornate urns containing ferns and flowers. The lamp pillars on the main floor and other pillars, twelve foot high, on the platforms, will all bear shields displaying the names of the exhibitors whose space they mark, this being a distinctly new and artistic sign scheme. A few heroic stautes in staff work will adorn the platform.

The same gray and crimson scheme will be found in the cafe and basement, but in the latter place the walls which do not flank exhibits will be picture covered. A rathskeller with novel grotto effect will be located in an out of the way corner of the basement.

In the concert hall, a departure in the decorative scheme is to be made by arranging it as an adjunctory rose garden, set with latticed arbors in green and white. There will be an arched entrance, with lattices of the double diagonal pattern framed in white, a central dividing lattice down the hall, while the walls under the balconies and back of the stage will be finished with the same restful design.

The full list of exhibitors at the show and their space allotments are as follows:

Main Floor.

1 Pope Motor Car Co.
2 Royal Motor Car Co.

AIDING GROWTH OF A SUBURB

Free Bus Line Operated in Developing New Section in Jamaica—Vehicles Large and of Reasonable Speed.

Lacking a trolley system on their streets, the promoters of the real estate enterprise on Long Island known as the Jamaica Estates have inaugurated an automobile car line for the benefit of their customers, so that residents of the property may have transportation to and from the Jamaica station of the Long Island railway. As the number of houses and residents increase, it is possible the idea may be further extended to provide a through automobile car line to Manhattan itself. An entirely feasible route via Hillside boulevard, which borders the Estates, Hoffman boulevard, Blackwell's Island bridge, East 60th street and Fifth avenue, offers itself. While the houses are still being built and prospective customers are being interested, the buses, one of which is shown in the illustration, are operated free, for the convenience of anyone wishing to inspect the property.

BUS ON JAMAICA ESTATES FREE LINE

Each bus or car accomodates 22 passengers, the vehicles being the products of Mack Bros., Allentown, Pa. The power equipment is a vertical four cylinder water-cooled motor, 5½ by 6 inches, rated at 50 horsepower. The transmission is of the individual clutch, selective type, with three forward speeds and a reverse, the drive being direct on third speed, with no gears in mesh. Double chain drive is used, to the rear wheels. The clutch is conical and is fibre lined. A double system of ignition is employed, being supplied by high tension magneto and by dry cells, respectively. The wheel base is 168 inches and the tread 72 inches. At a normal motor speed of 800 revolutions per minute the cars make about 12 miles an hour, but 20 miles an hour is possible on good roads and level running. The fuel capacity is 22 gallons of gasolene, giving a range of about 80 miles without replenishing. The machines, which are a regular stock model, sell for $6,500 apiece.

Precaution Against Broken Shaft.

Although the average driver of the shaft-driven car probably seldom realizes it, the unlikely accident of a broken shaft may be the cause of a most perilous misadventure. If the forward joint should happen to give way, for instance, the free end, falling to the ground, would immediately dig its nose well into the surface, in all likelihood overturning the car. A similar danger, though of less serious nature, exists in the case of the radius and distance rods which are used in staying the rear axle. As far as the cardan joints are concerned, however, one crumb of comfort remains, in that generally speaking, the strength of the protecting grease case is sufficient to prevent the free end of the shaft from falling, at least immediately on the giving way of the joint. The disconnection of engine and transmission, giving instant warning of trouble, even if no other and more audible indication is given, thus gives the driver time to pull up before the shaft drops. Notwithstanding this assurance, however, one well known foreign driver, is said to be in the habit of stringing wires across the under side of his chassis in such a way that in the event of an accident of this nature, the fractured member would be kept clear of the ground.

CHARITY AND MUCH MOORE OF IT

It Is to Ooze from a Road Race for Stock Cars—Two-Man Association Reorganizing to Run It.

T. Francis Moore, who is president and fifty per cent. of the "membership" of what is styled the Metropolitan Automobile Association, has officially announced that early next year it or he will conduct that "long distance road race for stock cars," which was not run on the Vanderbilt course this fall simply because a ton of lead suddenly fell on the project and crushed it flat after the sheriff and supervisors all had been "fixed up."

Moore says April 20th probably will be the date of the race, which will be run on a course "near New York." If it occurs, it will be a one day affair only and not a two days scorch as the late lamented project was to have been; also it will not be speculative sport, but a race for sweet charity's sake, with a very large C. "Everything above the running expenses will be turned over to some charitable institution," says Mr. Moore. And Old Running Expenses, like Sweet Charity, can be made to cover a multitude of sins and other items.

Mr. Moore's desire to serve the cause of charity is so great that he means even to reorganize his Metropolitan Automobile Association. Before April 20th it is believed that its membership will be doubled and that fully six names then will be on the roll. Meanwhile, that obliging gentleman, Robert Lee Morrell, has consented that his name be used as chairman of some sort of an executive committee.

Chicago Plans Reliability Run.

A three-days reliability run covering 600 miles is the latest project of the Chicago Motor Club, which this week decided to promote a strenuous contest of this kind during the week preceding the Chicago show. The dates selected are Tuesday, Wednesday and Thursday, November 26, 27 and 28.

The Windy City organization's latest effort for publicity for its members will be divided into three parts, the finish of each day's run bringing the contestants back to Chicago at night. The first day's run will be to South Bend, Ind., and return; Wednesday's turning point at Milwaukee, and Thursday's route to Rockford, Ill., and back.

Three classes will be provided, for cars selling at $1,500 and under, under $3,000 and over $3,000. Each entrant must nominate an observer that will be able to satisfy the committee he knows an automobile from head to tail light and in between.

It will not be a sealed bonnet contest, but the committee intends to seal the hub caps, gear cases, differential cases, steering gear parts, coils and magneto covers, but it does not follow that a car will be disqualified if one of these seals is broken. Instead the committee will attach a penalty to an infraction of this kind, varying to the character of repair or replacement necessary. Penalties for adjustments will be imposed according to the time taken in making them.

As passengers will be difficult to procure at the time of the contest, each car will have to, of course, carry a driver and observer, and in case of a touring car a mechanic may be taken along, but five passenger cars will carry dead weight for the absent passengers, figuring on 150 pounds of sand for each absent passenger.

At the completion of the test the technical committee of the contest will give each car a short running test on the road. In case it is found that the car is not in good running order penalities will be imposed even if the car has survived the ordeal without touching a seal.

Stories of the Roadside Signs.

An observing person who tours extensively should be able to write quite an interesting chapter on the signs set at the roadside by village officials, remarks a tourist of the sort. In Monmouth county, New Jersey, for instance, there is a sign reading: "Automobilists must be moderate. By order of the Freeholders." There is nothing to indicate whether moderation in drink or speed is meant. Up in the Catskill mountains, New York, all road travelers are suddenly confronted by a sign saying: "Blow your horns here," and nothing more. The motorist knows that this is meant for him, but it must be a bit startling to those who have no horn. In northwestern Pennsylvania, it has been thought worth while to try politeness, and a sign reads: "Please go slowly here." That "please" appeals to almost every man behind a wheel and he slackens his speed. Of the other sort there are several on Long Island, where big bullying placards bid "Autoists Beware! The speed limit will be strictly enforced."

Lubrication the Most Important Point.

If there is any one most important point connected with the use of gasolene engines, or engines of any other sort, for that matter, it is the matter of lubrication,' remarked a motor manufacturer a few days since, "but despite its importance it is difficult to drill the fact into the brains of those who use motors. Whether they use motor cars, motorcycles, motor boats or air ships, the disposition of the operators is to give the motors too little oil. 'Spare the oil and spoil the motor' is a paraphrase that ought to be pasted or engraved prominently on the dash of every car."

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

RULES AND ROUTE FOR JERSEY RUN

Endurance Contest to be 24 Hours of Ordinary Road Driving—Twice Over Course of Nearly 100 Miles.

There is nothing new or startling in the rules for the New Jersey Automobile and Motor Club's 24-hours endurance contest, which has been set for Friday and Saturday, November 15 and 16. When the subject of a 24 hours' contest over New Jersey roads was first broached it was thought that it would develop into a scorch for a chronological day. This is far from being the case, as the contest merely is the old-fashioned endurance contest on a twenty-four hour schedule.

The route, as mapped out, will take the contestants over 94.4 miles, the same course being covered twice. Consumption of gasolene and oil will not figure in the awards, but the contestants will be scored for repairs and replacements, and failure to arrive at a control on or ahead of time. In this run the cars all will be considered in one class, the division of touring cars and runabouts not being made as was the case in some previous contests of the sort.

To arrive at the final control more than three minutes ahead of schedule or more than three minutes behind the time set for arrival will cost the contestant two points in either case, while a stop of the motor between controls, without making adjustments will result in a loss of three points. A stop of the motor for the purpose of making repairs or adjustments will mean a deduction of four points, while three will be charged if the car is stopped on the last circuit, even if no repairs or adjustments are made. To repair a car or make adjustments with the motor running means a loss of two points and if more than the driver assist in making repairs, double the rate will be charged.

The route, which will be covered twice in the two days, is as follows: Newark, Bloomfield, Glen Ridge, Montclair, Verona, Caldwell, Pine Brook, Parsipanny, Danville (24.7 miles), Rockaway, Dover, Kenvil, Succasunna, Mt. Freedom, Morristown (45 miles), Bernardsville, Far Hills, Bedminster, Pluckemin, Somerville (66.7 miles), Bound Brook, Dunellen, Plainfield (78.3 miles), Scotch Plains, Springfield, Hilton, Irvington and Newark (94.4 miles).

Eads Gives the Kids an Outing.

Instead of waiting for a club to do it the Premier Motor Mfg. Co., through its sales manager, R. I. Eads, last week took the initiative and gave the orphaned children of Marion county, Indiana, an automobile outing. More than 100 children were given the "time of their lives," it requiring 21 cars to care for them all. Needless to add, all of the cars employed were Premiers.

ATTITUDE OF CARRIAGE BUILDERS

Importance of the Automobile Industry Discussed at Their Annual Meeting—Carriage Trade Slackening.

Carriage dealers from all over the country gathered in New York this week for the thirty-fourth annual meeting of the Carriage Builders' National Association of the United States. In the course of their deliberations and speech making, the automobile was not overlooked and it appeared with some prominence, also, at the show where new carriage models were exhibited for the benefit of dealers, five cars fatherd by carriage makers being among the exhibits. Of the addresses delivered, that of the president of the organization, Daniel T. Wilson, head of the fashionable New York carriage concern of Flandrau & Co., had the most direct concern with the automobile. He told the members that they should have to consider the automobile in their future reckonings and advised their taking up the sale and partial manufacture of motor cars. He also commented on pertinent phases of general business relating to the vehicle trade and to the automobile trade, as well.

"Every carriage manufacturer, repairer and dealer in the United States," said Wilson, "must be aware of the changing character of our trade, and should know that the builders of every grade of work, from the lowest-prived buggy to the costliest four-in-hand, must at once welcome the automobile as a legitimate part of their business, to be studied and built and sold by carriage builders. I do not mean the costly and intricate chassis, though a tendency is already noted towards purchasing the complete automobile from carriage builders—but we should surely supply all those parts pertaining to our trade.

"Carriage builders have the plant, experience and workmen to properly manufacture and repair automobile carriage work, can do the work as well as for the horse-drawn vehicle, and should seek that business from the customers who have always favored them with their trade."

In relation to the general conditions prevailing in the vehicle industry at the present time, President Wilson gave expression to views which must be of interest to those recognizing their relation to the automobile field.

"You will all agree," he said, "that in the last few months there has been a lessening of the tremendous demand and activities in our trade, and carriage builders must use great caution, both now and in the future. Additions to plants should be avoided; a reduction of stock on hand, finished and in process of finishing must be made; the purchase of all materials curtailed as nearly as possible to assured requirements; our liabilities reduced so that we may do our rightful share in getting the plants and stock carried more in proportion to the capital invested. This every trade, for a few years, at least, must do—not that hard times are again upon us, but that the wonderful and enormous expansion of all trades in all lands has been so great that a reaction, not heavy, but a reasonable reaction, is naturally due."

Addressing the convention from the retailers' standpoint, Henry M. Duncan, of New York, declared that the retail carriage dealers had this year been "up against a hard game." He blamed it partly on the motor car, but disclaimed any enmity against it.

"I am not one of those who believe that the horse is destined to disappear from our streets," he said. "I believe the horse has an abiding place in the commerce as well as the affections of the world. But I am not going to knock the auto builder. I would rather throw bouquets at him and secure his friendship. Knocks don't phase him anyway, as he knows he is the next thing.

"As to the auto, the limit of whose progress no man can tell, it has found its place and will abide, and the wise carriage maker is the one who takes a hand in the game and secures a portion of the profits."

The difference between the carriage and the automobile situations was never better illustrated than by two shows which are being held in New York this week, over which no fuss the lowest-priced buggy to the costliest discharged, and without the public being worried about "1908" models or anything of the kind. The carriage builders are holding their annual convention, and the makers of tires, wheels, tools, parts and accessories fill the whole of the St. Nicholas Rink on Sixty-sixth street with their exhibits in their campaign for the manufacturers' business, while at Grand Central Palace the complete vehicles hold forth for the inspection of dealers and such of the public as wish to attend. Meanwhile purchasers of carriages and horsedrawn vehicles are not withholding their orders in breathless impatience to discover what the 1908 models will be, nor do they entertain any fears that by purchasing a few days before the carriage show that they will have to endure the scorn of their friends and neighbors for getting "stuck" with a 1907 model when by waiting they could have had a 1908 product.

Making Large Nuts Serve.

In an emergency, a nut that may be too large for permanent use, may be made to serve merely by striking it with a stone or hammer and thus throwing it "out of round." In this oval shape it will hold the threads on two sides, but it will be necessary to watch it to see that it does not work off.

CONNECTING UP THE SPARK COIL

Some of the Difficulties and Suggestions for Meeting Them—Explanation of Signs on French Ternimals.

Although to one who is familiar with the inner construction of the typical spark coil, as well as its scheme of action, there is nothing difficult or complicated in making the proper connections when mounting it on the car, one who is not so well informed frequently is sorely puzzled to make the system work properly. This is further complicated when an unusual type of coil is employed in which the leads are taken out of the case in a single group unlabelled, or are marked with symbols denoting foreign words, as is generally the case with French coils. The varying number of terminals found in different coils, also contributes to the confusion.

As a matter of fact, there are no less than eight points of connection to be made in completing the system for each cylinder, where the usual jump spark system is employed. Ordinarily these are reduced to three or four per cylinder, and in multiple-unit coils, to even less, one terminal commonly serving as a ground return for all the circuits. Where the terminals are unlabelled or where the marks are indistinct, it usually will suffice to make a preliminary test by connecting the battery to various points in turn until the proper spark is developed. Some little confusion will result when this is attempted, however, unless the principle of the thing is perfectly understood, and, as a matter of fact, no exact directions can be given which will serve where it is not.

As for the coils which are marked plainly but in the initials of French instead of English terms, the matter is not so difficult For instance, in many of the older coils. either of French origin, or made after the French plan, the usual lettering for the four terminals is M, P—plus, C, and B; in which M stands for "masse," and means that that terminal should be connected to the mass or frame of car or cycle. It corresponds to "earth," though no actual earth connection ever is made, the body of the car providing the return path for the current. The letter P, stands for "pile," that is battery or accumulator, and shows that the terminal is connected to one end of the primary winding of the coil, and this is coupled to one of the wires proceeding from the accumulator or dry cell, usually the positive or plus wire. If this terminal be marked P—plus, it may at once be understood as meaning "primary terminal to be coupled to positive of accumulator." C, denotes the outgoing terminal, and in all types of coils, whether French or English, should be coupled to the contract breaker, or commutator, either directly or through the intermediary of any

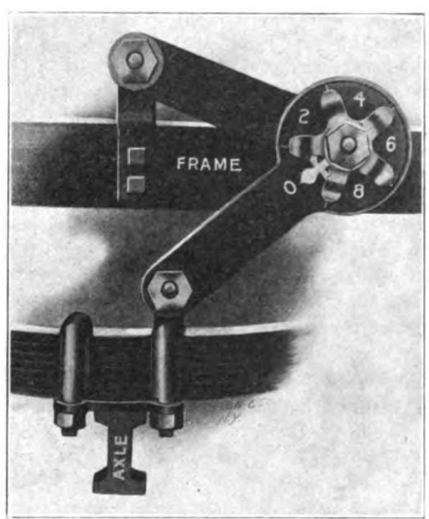
Digitized by Google

switch, that is necessitated by the system of wiring. B, the abbreviation of the French word "bougie" stands for the plug, and points to the fact that this terminal must be coupled direct to the terminal of the ignition plug.

With a view to rendering these abbreviations clearer some makers mark additional letters near the terminals, such as P—plus, and A—plus, for primary coil, indicating that this terminal must be cannected to positive pole of accumulator or dry cell; plus signifying positive. Along with M, near one terminal may often be found the letter E, this being the corresponding English term for the French word "masse." The terminal B, which, as already noted, should be coupled direct to the sparking plug, also is marked frequently with the additional letters S. P. (sparking plug). But the question becomes less complicated, when, by reason of internal connections having been made in the coil itself, the number of external terminals is reduced to three only, which in these cases are marked P, B and C, that is to say, battery, plug, and commutator.

Old Question of Speed Revived.

A revival of the old debate as to whether cars run better at night than they do in the daytime, has been going the rounds of the foreign press for some little time, and with the result of bringing forth the usual differences of opinion. The matter appears to have been definitely settled, however, by a locomotive superintendent, who states it as his opinion that although both with cars and railway trains, it is customary to judge speeds as being faster at night than in the daytime, the difference is due entirely to an error in judgment in the latter. case. His observation has been that in both cases, speed indicator and distance schedule results have shown no actual difference either way. His locomotive experience has entended over twenty-five years, he says, while as to automobiles, for the last three years, he has been daily making a stated run night and day, and over the same road.



Utilizing Principle of Pelton Wheel.

An effort to develop a form of hydraulic transmission, utilizing the principle of the Pelton water wheel, recently has been made abroad. The driving portion of the system consists of a centrifugal pump, actuated directly by the motor, and drawing its supply of water or oil from a special reservoir. The driven members comprising an individual motor for each wheel of the vehicle, consist of a set of true Pelton wheels, mounted in suitable casings partly enclosed by the great "dish" of the wheels themselves. The casings are stationary, and the rotors within them drive the wheels through planetary reduction gearing, exhausting back to the supply tank. The arrangement is especially designed for the use of heavy vehicles of the commercial type.

SHOCK ABSORBER IMPROVED

New Features Added to the Truffault-Hartford—Device to Assist in Making Exact Adjustments.

Considerable improvement has been made in the Truffault-Hartford shock absorber for 1908 by the Hartford Suspension Co., 67 Vestry street, New York City, through the adoption of an extremely simple indicator applied to the regular tension adjustment, whereby it is possible to equalize the resistance upon opposite sides of the chassis, thus obviating any possible tendency to warping the frame, or straining it unnaturally. In addition to this, some little improvement has been made in the construction of the friction joint itself as a result of which the durability of the arrangement is not a little increased.

Three arms of equal dimension, two of them being paired and placed in opposition to the other, are joined together by means of a central stud, their respective extremities being joined to the frame and the spring seat of the axle. The central arm works over a hardened steel bushing which rides on the stud, with a straight up and down motion, without side swaying or any tendency to shearing. Directly outside the central arm, are placed the friction discs, which are of secret composition, having self-lubricating properties such that no lubrication is effected until the temperature has been raised almost to the point of abrasion. The material employed, was introduced last year, and has proved equal to all that was claimed for it at that time. The two outer arms bear against a couple of brass discs, cup shaped, and firmly secured in place, instead of directly against the friction washers, as formerly. Over these is fitted a brass cup, into which the friction and brass discs are telescoped. A complete protection of the joint and guard against the admission of dirt is thus formed.

The special new feature, consists in the use of a pointer arrow and recording dial in connection with the five pronged steel washer and locking nut which binds the parts of the friction joint together. By its use it is possible not simply to adjust the several absorbers mounted on any car in such a way as to give an equal resistance to spring plunging, but also, to make that adjustment suit the exact requirements of the car, as measured in terms of its gross weight. A blue print is furnished with each set of absorbers, showing how they should be applied to the car, as well as a table, showing the setting which should be given in order to get the proper results. As adjusted at the factory, the end joints have a resistance of 10 pounds each, and the main or center joint, 20 pounds. This is sufficient tension for a car weighing from 1,600 to 1,800 pounds. For a car weighing from 1,800 to 2,000 pounds, the pointers are turned from 0 to the 1 mark, and so on, each division of the scale corresponding to the increase in tension required for each 200 pounds additional weight in the car. Occasionally, for a car which has been in use for some little time, a slight increase in tension may be found necessary, but ordinarily, once made according to directions, no further attention will be required.

Value of the Accelerator.

It seems strange that there should any longer be differences of opinion as regards hand and foot control for the throttle, yet some makers still ignore the obvious merits of the foot accelerator, and rely entirely on a hand lever on the steering wheel, remarks the London Field. The latter was only tolerable with a good governor on the engine acting independently of the hand throttle; but nowadays engines and carburetters are so flexible that the governor is usually deemed superfluous. It is here that one finds the value of the accelerator, especially in traffic or on winding and hilly roads, where much gear changing and manoeuvring are necessary. With only a hand throttle the right hand is constantly occupied in controlling the engine, when it is also wanted for the horn and the gear and brake levers. With an accelerator pedal the control is vastly quicker, neater, and simpler. The hand throttle is set for a minimum engine speed, thus acting as a governor, and all necessary power is got by a touch of the right foot on the accelerator. When the left foot declutches for slowing or gear changing, the right foot releases the accelerator and the engine is instantly governed. Thus the right and left foot balance one another, and the hands are left free for steering, horn, gear and brake levers. With professional drivers the best arrangement is to fit two separate throttles and connect the accelerator pedal to the upper one, so that if the hand throttle should be carelessly left wide open the engine cannot race when starting up or declutching.

PARKIN IN FRONT AT TRENTON

Led all the Way in 10-Hour Grind at Interstate Fair—Rain Curtailed Event, Scheduled for 24 Hours.

A heavy rainstorm last Wednesday put a crimp in the plans of the sports managers of the Interstate Fair at Trenton, N. J., to hold a 24-hour race on the half mile track at the grounds. It had been planned to start the race at 6 o'clock in the evening, but the interference of the rainmaker made this impossible, so it was decided to reduce the time to twelve hours, starting at 9.30 a. m., Thursday, 5th inst. Even these plans went awry, and it was not until 2 o'clock that afternoon that the cars finally were started for a 10 hour race. The race was won by J .W. Parkin, Jr., of Philadelphia, driving a Walter car; Parkin covered 359¾ miles, an average of almost 36 miles an hour. Another Walter car, driven by young Edwin Walter, finished second with 347⅜ miles.

Owing to a delay in finishing some horse races, it was nearly 2 o'clock in the afternoon before the automobiles were allowed on the track, so the drivers did not have much time to acquaint themselves with the sharp turns of the half-mile oval. Six cars were sent away promptly at 2, a Thomas with Schill and Newell up; a Stearns, driven by Endicott and Coyle; a Rolls Royce, with Burns and Kugler; a Walter, with J. W. Parkin, Jr., at the wheel and his helpful father beside him; another Walter, by Walter and Wilson, and a Franklin, handled by Eisenburg and Enderbrock.

The first few miles of the race were well contested, but in the fourth mile a bolt in the clutch on the Stearns broke and it was laid up for nearly an hour, the other cars having covered 35 miles before Endicott got in the running again. In the 25th mile the Rolls Royce made an effort to pass the Walter driven by the Parkins. For five miles they raced side by side when the English car passed the Trenton candidate, but it no sooner had gained the lead than the left front tire went down and out and the Rolls Royce cut up a section of fence, and demolished a refreshment stand occupied by one W. C. Glynn. The pink lemonade merchant escaped with a slight shaking up and a bad scare. Neither Burns nor his mechanic were scratched and the car was only dented a little.

Instead of hauling the car off the track while it was being repaired, Burns and his mechanic set to work to right the damage with part of the car jutting out on the track. This raised a howl of protest from Frank A. Poth of Philadelphia, who had entered the Stearns and Thomas, and who insisted that the English car be disqualified. The other contestants were willing to overlook the breach in track etiquette made by the driver of the Rolls Royce, but Poth was obdurate and the officials reluctantly disqualified the car. At the end of the first hour the score was 40 miles for Parkins's Walter, 37½ miles for the other Walter; 35 miles for the Thomas, 31½ for the Franklin, 30½ for the Rolls Royce, and 4 miles for the Stearns.

Parkin used good judgment and kept the lead throughout, covering the first 100 miles in 2 hours 37 minutes, which is pretty fast going on a half mile track. The Thomas was handicapped by punctures. At the ending of the fourth hour Parkin had covered 147 miles and his team mate was credited with 140½ miles. The Thomas was nine miles behind the Walter and the Franklin had completed 125 miles.

From 6 o'clock until the finish at midnight nothing of unusual interest occurred. When Parkin and Walter discovered that they had the race practically won they eased the pace somewhat and jogged around at a steady clip until the gun sounded the finish. The final score was: Parkin (Walter), 359¾ miles; 2, Walter (Walter), 347⅜ miles; 3, Eisenburg (Franklin), 290¼ miles; 4, Schill (Thomas), 184 miles; 5, Endicott (Stearns), 156 3-16 miles.

Race Meet Planned for Middletown.

The Motor Club of Harrisburg, Pa., has arranged to hold a race meet at the Middletown track on Friday next, 18th inst. Following is the card of events, which has been sanctioned by the American Automobile Association: Two miles motorcycle handicap; two miles for gasolene runabouts, $1,200 and under; two miles for single cylinder gasolene cars, 1904-6; three miles handicap for steam cars; three miles for gasolene touring cars, $5,000 and under; one and one-half miles gymkhana; two miles for gasolene cars, $2,000 and under; two miles for gasolene two cylinder cars, 1904-6, $1,500 and under; two miles gasolene touring cars, $1.500 and under; two miles for steam touring cars; ten miles handicap, all gasolene cars; two miles for electric cars; unlimited pursuit for gasolene cars.

Rainy Setback for Chicago Club.

For the second time in two weeks the racing board of the Chicago Automobile Club has found it necessary to postpone its fall race meet at the Harlem track. The program scheduled for last Saturday has been held over until Saturday of this week, 12th inst., the rains of last week having made the track too dangerous for racing.

"Automobile Day" for Allentown Fair.

Seven open events and several special races for local drivers will be the feature of the Allentown (Pa.) fair on October 26th, which will be known as "Automobile Day." The program has not been arranged, but it is stated that the meet will be sanctioned by the American Automobile Asso-

OLDFIELD COPS FORT WAYNE CASH

Drives Exhibition Two Miles in Less than Two Minutes—Beats Savin in Customary Grandstand Finish.

Barney Oldfield won $100 at the Fort Wayne (Ind.) driving park track on Tuesday last, 1st inst. How much more he obtained is not known, as the amount of his appearance money is not stated, but it is certain that he pocketed the yellow century offered by the Fort Wayne Automobile Dealers' Association to the driver making the best mile under the minute mark at the race meet conducted by that association. Oldfield was the "star" of the meet and made good in his usual manner by beating his protege, Ollie Savin, in a grandstand finish in their two mile encounter. Oldfield and Savin got away to a flying start, the latter taking the lead. Oldfield let Savin set the pace until within a hundred feet of the tape, when he opened the throttle and passed his partner two feet from the tape.

Oldfield "copped" the hundred dollars by driving an exhibition two miles in less than two minutes. The first mile was covered in 58⅗, and the final in 54 seconds flat. Savin then tried to lower Oldfield's time, but failed by several seconds, making the two laps in 2:00⅗.

The stock car events were nothing extraordinary. Three motorcyclists made the first race, the event going to Harvey Hickos in 3:35 for two miles. Edward White won three of the other four events. The first was two miles for cars costing $1,000 or under and White's car led George Aldrich's under the wire in 3:28⅗. There were only two starters in the two miles for cars costing $1,500 and under and White's machine took this with ease, as it did also the three mile events following. Summaries:

Two mile exhibition—By Barney Oldfield. Time, 1:42⅗.

Two mile exhibition—By Ollie Savin. Time, 2:00⅗.

Two miles for motorcycles—Won by Harvey Hickos. Time, 3:35. Also ran—N. B. Dure and C. C. Kelly.

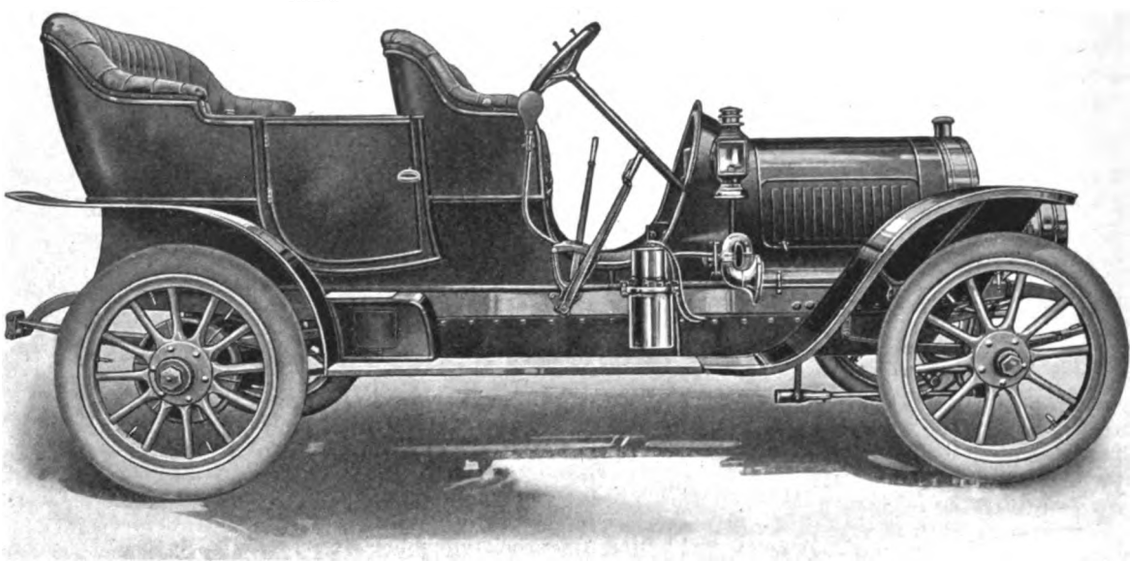
Two miles for cars under $1,000—Won by Edward White; second, Dr. Duemling. Time, 3:28⅗.

Two miles for cars under $1,500—Won by Edward White. Time, 3:06.

Three miles for cars under $3,000—Won by Edward White; second, William Griffin. Time, 4.32⅗.

Three mile handicap—Won by William Griffin; second, Ollie Savin. Time, 3:15.

Five mile novelty—Won by Walter McClellan; second, Barney Oldfield. Time, 9:01.



Two mile match—Won by Barney Oldfield; second, Ollie Savin. Time, 2:15.

The Pope Hartford "30" for 1908

$2750

Says the Hartford Globe, Sunday, Oct. 6th:—
"Certain it is the new Pope-Hartford is a beauty. The lengthened wheel base, the larger wheels, longer springs; the new convex body lines, the large and roomy tonneau, with large side door; the rakish steering column with larger steering wheel, with the front axle directly under the radiator, gives the car an appearance that is at once distinctive and decidedly 'smart.'"

Changes in design and construction of the Pope-Hartford for 1908 are not of a revolutionary character. The modifications adopted tending only to further refine and bring the product thoroughly in line with the best and latest practice.

The 1907 Pope-Hartford was right. It made hill-climbing, touring, track and reliability history

The 1907 Model L is admittedly and unquestionably the speediest, most powerful, most popular and highly endorsed car in its class of the year.

Model M, its successor, has now been on the road many weeks; has been put to every conceivable road, hill-climbing, speed and reliability test.

SOME NEW FEATURES FOR 1908 ARE AS FOLLOWS:—

Selective change speed gear. Gears of Chrome nickel steel. Road wheels 34x3½ and 34x4, respectively. Wheel base 112 inches.

New carburetor giving all the flexibility of the multiple jet vaporizer. Quietness of operation of all gears. Radiator is now located directly over front axle.

The Clutch same as Model L, excepting cork inserts to the number of 34 have been added. Rear axle is now of the clutch drive type, rather than the semi-floating variety as used in the 1907 car.

The brakes, both internal and external, have been increased in surface, width and diameter. An important detailed improvement of rear braking construction is the taking of the driving and braking torque by the same member of the hub construction.

The steering column has been given a larger rake, and a much larger hand wheel is supplied.

The 1908 body has convex lines, is decidedly more roomy. Front springs are 2x38 and the rear 2x52. Aluminum guards with patent leather aprons.

Ask us to do any "stunt" you want; ask us to go where any car will go irrespective of make, price, horsepower or number of cylinders.

If you make the others, in and out of our class, do the same things under the same conditions, you'll buy a Pope-Hartford.

The Pope Manufacturing Company, *Members A. L. A. M* **Hartford, Conn.**

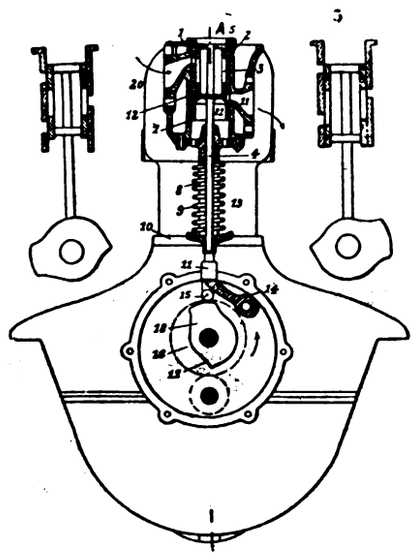
ADOPTION OF THE PISTON VALVE

First Application of the Principle in Gasolene Motors of the Automobile Type —Advantages of the System.



An extremely simple application of the principle of the piston valve to the requirements of the internal combustion motor of the automobile type, has lately been developed by the Peugeot company of France, constituting what is, so far as is known, the first attempt to use this sort of distributing mechanism on so small a motor. In general construction, it is of the double headed type, only the enclosure between the two heads being employed in handling the gases, the two ends being exposed to the atmosphere, and thus being more or less cooled automatically, by the natural circulation induced by their motion. A single cam serves to effect the required movements of the part, a retaining spring holding the lifter against the cam surface as with the ordinary type of valve.

The figure shows a section of a motor to which this system is applied, in which the valve is seen in the inlet position. Similarly, in the two smaller sections, the valve is shown in the neutral, or compression and ignition position, and in the exhaust position. Thus it must be evident that, contrary to the practice in controlling the ordinary valve, instead of a continuous opening or closing movement, the valve has three points of rest, one so disposed that the inlet relation will be set up, one, such that both inlet and exhaust ports will be sealed from the cylinder, and corresponding to a dwell of two piston strokes, and the third such that the exhaust may take place in the usual way.

Mechanically, the valve consists of two annular rings, closed by walls, marked 1 and 2, in the first illustration, located by means of the spacer, 3, and secured on the extremity of the valve stem, 4, by means of a nut, 6, and locking ring, 5, which hold against the shoulder, 7, on the stem. The valve rides in the sleeve, 12, in which the ports 20, 21, and 22 are cut, its stem following the guide, 8, concentric with the sleeve. It is constantly impelled toward the lower end of its travel by the spring, 9, which rests against the cylinder, 13, at the base of the guide, and at the other end, upon a washer, 10, carried by the stem itself. The lower end of the stem is carried by a rocker, 14, mounting a roller, 15, which bears against the cam, 16.

The port, 21, communicates with the cylinder, ports, 20 and 22, respectively throwing the former into communication with the inlet and exhaust manifolds. The space enclosed between the two heads of the valve, merely serves as a medium of communication between the cylinder and the two ports, serving the inlet and exhaust alternately. By suitably shaping the cam, 16, the distribution of the ordinary four-stroke cycle may be effected without difficulty. A regulating screw, 11, at the base of the valve stem, permits of adjustment for position in the sleeve, while for governor regulation, or hand control of the motor, the cam is made conical in longitudinal section, thus permitting a variation in the distribution according to the lengthwise displacement of the cam under its follower.

Obviously the chief advantages of such a system are, its simplicity as compared with

the ordinary valve gear, and the fact that it is balanced. On this account the only load on the mechanism is that due to the friction of the parts, the heavy strains obtaining ordinarily in unseating the exhaust valve against the full cylinder pressure, being quite eliminated.

Goggles and How to Test Them.

Motorists who use goggles and who complain of headaches and ill-feeling after driving, may well look to the goggle lenses as the source of their trouble rather than to put their faith in medical prescriptions or treatment. Many cheap goggles have lenses that are not entirely neutral, as they should be unless especially ground to take the place of the glasses usually worn by the driver. The effect of the cheap glass with irregularities in its surfaces or thickness is to strain the eyes as badly as if they were affected with severe astigmatism. A simple test for goggle lenses is to hold them away from the eye and move them in circles while looking through them. If the objects seen through the lenses seem to move too, it is an evidence that the glasses are not neutral and should be avoided. The best protection is the selection of goggles of known reputation, in which guaranteed neutral optical glass is used.

"The A B C of Electricity." Price 50c. The Motor World Co., 154 Nassau St., New York City.

TO PREVENT FREEZING TROUBLES

While Many Motorists "Trust to Luck," the Preventive is Simple and Effective—What It Is.

As the snow season approaches, one topic of perenial interest to the user of the water-cooled car, is that of the danger of freezing, whether or not definite steps should be taken to prevent it, and if so, what method should be employed. It is the custom with many drivers to do without anti-freezing compounds of any sort, trusting to luck to be able to keep the motor running whenever it is exposed to freezing temperatures, and relying on their own presence of mind and quick action, to drain off the cooling system in case of a breakdown involving the stalling of the motor. While this may be well enough ordinarily, it involves no little risk, and it is generally conceded that it is far better to infuse into the cooling water some substance which tends at once to lower its freezing point without materially altering its efficiency as a cooling medium.

What to use for this purpose, however, and how to use it, is rather a difficult matter to decide. All sorts of salts and solutions are recommended by various authorities, some of which are more or less useful, but more of which are distinctly evil in their tendencies. Thus one compound may tend to corrode the walls of the copper tubing through which it is led, another may eat into the rubber of the flexible connections, still another may deposit sediment and clog the fine passages in the radiator, while a fourth may volatilize and give off unpleasant or even dangerous vapors when heated beyond a certain point. On this account, it is well to use only such compounds or mixtures as are sanctioned by careful tests, rather than such as may be recommended by the casual user, or the interested dealer.

Probably the most useful as well as the least troublesome mixture which it is possible to find, is the glycerine-alcohol-water combination recommended by Souther in one of the most useful little pamphlets of its kind ever published, "The Freezing Problem Solved," published by the Motor World, and describing the method of experiment by which the correct solution was fixed upon. Briefly, the best results are obtainable by the use of alcohol and glycerine in equal parts, added to the water in the system in the ratio of about one to two. This gives sufficient resisting power to prevent any tendency to congealing of the mixture at any point higher than 10 degrees below zero, Fahr., does not tend to destroy the system in any way, with ordinary useage, does not waste rapidly, and requires only a little alcohol if the average temperature falls very low, in order to further reduce the freezing point.

BENZOL PROPAGANDA PERSISTENT

Expert's Analysis Showing Fuel Value of the Product—Points of Comparison with Gasolene Discussed.

In Great Britain, the Benzol propaganda is being carried out with considerable force—largely for commercial reasons, and hinging about the desire of sundry refiners to build up a market for their hitherto largely waste by-product. That something is likely to come of it in the way of a fairly general use of the coal derivitive instead of the petroleum compounds, would seem to be the case, however. Several brands of Benzol are already on the market, which closely resemble one another in their properties, and their makers are using every concievable effort to get a favorable representation among the more prominent tradesmen and users. The following notes which are from the pen of Edmond Ledoux, a well known authority on fuels, relate to the qualities of "Simcar" benzol, a fuel prepared by Simon-Carves, Ltd., Manchester.

"Benzol is one of the richest bodies in carbon, and consequently requires an adequate quantity of air to obtain complete combustion without producing soot," he observes. "The physical differences between benzol and petrol are shown in the following table:

Fuel.	Benzol.	Petrol.
A Specific gravity	0.880	0.700
B Calories per litre.....	8,844	7,910
C Calories required to vaporize one kilo..	130	160
D Calories required to vaporize one litre, = A x C.....	114.4	112.0
E Calories required to vaporize a quantity having 1,000 calories of energy, $= \frac{D}{B} \times 1{,}000$	12.9	14.1

"The column 'B' shows that benzol at equal volumes contains twelve per cent. calories (or energy) more than petrol. Therefore in the storage tank of a motor car can be stored in the shape of spirit twelve per cent. more energy (or mileage) without running the tank empty.

"Column 'E' shows that to produce the same energy benzol takes nine per eent. less calories to carburate the air than petrol. It is, therefore, a better carburant, notwithstanding its heavier specific gravity. This is generally not the case with a spirit derived from petroleum or shale oil in which the heavier the specific gravity the more difficult it is to carburate the air. For instance, it has been found very difficult to use in an ordinary carburetter petrol of a greater specific gravity than .700 without having some trouble in obtaining the proper explosive mixture.

"The cost per gallon of benzol is less than for petrol. One gallon of benzol gives twelve per cent. more mileage than one gallon of petrol.

"The figures given in the above table will enable us to study the difference in the regulation which the carburetters have to undergo, according to the mode of distribution of the liquid.

"In petrol motors where the fuel is sent into the vaporiser, or carburetter, at each admission by means of a little pump, the difference in the density between the liquids has no influence, as is also the case in the Gobron motor, in which the liquid is distributed by a tap provided with grooves which deliver a constant quantity of liquid at each revolution. But in this case the capacity of the feeding pump, or of the grooves, should be decreased by about eleven per cent.—the table above shows that eighty-nine volumes of benzol will replace one hundred volumes of petrol.

"In the spray carburetters (of which the Longuemare is one of the best known) the liquid is brought into the current of air either by a central opening provided with or without a needle, or by a grooved valve which is lifted by the suction produced by the aspiration of the motor; in both cases the liquid is carried along and vaporised by the current of air. In all these carburetters the liquid is maintained at a fixed height from the nozzle of the sprayer by a constant level float, and for this reason a little regulation is necessary when using benzol with these carburetters.

"As above mentioned, the constant level is obtained by using a float which when rising checks the flow of liquid by a needle valve; the depth of the liquid in the carburetter is therefore always equal to the height of liquid necessary to lift the float. It is important to keep the level of the liquid in the carburetter at the same mark as it is constructed for; therefore if benzol is used, and as this fuel has a greater specific gravity than petrol, the float will require to be loaded by means of a washer in order to dip into the liquid to the same level. The weight of such a washer can be easily arrived at by experiment, as follows:

"Take the float of the carburetter out and dip it into petrol; mark the level it dips into the petrol. Do the same with benzol, and then add some thin washers (of copper or lead) until the float dips to the same level as in petrol.

"Or this can be arrived at by calculation as follows: Calling a the distance in millimetres between the two liquid levels on the float in petrol and in benzol calling d the diameter of the float in millimetres, the formula as under will give the weight x in milligrammes:

$$\frac{3.1416 \times a \times d \times d}{4} \times 0.88 = x$$

(The coefficient 0.88 is the specific gravity of the benzol.)

"As benzol has a specific gravity greater than petrol, the flow through a given aperture with an equal head is less for benzol than petrol. The known formula

$$V \times V = \frac{2gh\,D}{d}$$

shows that a flow of 100 volumes of petrol corresponds to a flow of only 88.9 volumes of benzol.

"By referring to the table above, it is seen that only 89.3 volumes of benzol are required to produce the same number of calories, or energy, as 100 volumes of petrol, since petrol has only a calorific value equal to 89.3 per cent. of that of benzol. Consequently it is not necessary to alter the apertures of the spray.

"In the case of the electric ignition there is nothing to change, and one can easily find the necessary advance of the spark where the motor gives the full power without knocking.

"The motor will start cold with benzol equally as well as with petrol, and the carburetter need not be heated. Benzol being richer than petrol for the same volume, it is advisable to admit more air. * * * It is unnecessary to increase the aperture of the jet. Allow a slightly greater air supply."

Text-Book on Gas Engines.

A very concise and useful text-book of the home-study order, is "Gas Engines and Producers," just issued by the American School of Correspondence, Chicago, Ill., under the combined authorship of Prof. Lionel S. Marks, and Samuel S. Wyer. The two subjects are treated independently, in separate sections of the volume, each amounting to a brief essay drawn in popular style with only so much of theory and technicality as may be required for a fair working knowledge of the processes involved. The usual chapter of history serves to introduce each section, and in both cases, the theoretical phases of thermodynamic and chemical actions are elucidated in such a way as to be comprehensible without the aid of a dictionary. The book is limited in scope by its size, however (138 pages 12-mo.) and hence is useful only in showing the way to more complete study, or as a general review of this very important branch of mechanical engineering. Gas engines, for instance, are treated very thoroughly as to their principle, and action, as well as with some regard to their practical operation; but only a limited amount of space is devoted to their specific applications to different sorts of duty. The same applies to the second section, in a general way.

Joints that Should be Kept Tight.

All connections between the cylinder and the carburetter must be tight. If any one of the joints become loose, admitting extra air, the mixture will become so diluted that the engine will skip and lose power alarmingly.

GOVERNMENT INSIGNIA IN TRADE

Discouraging the Use of National Emblems for Advertising Purposes—How Laws Apply in the Matter.

With the great expansion of advertising the question of the use of the United States flag or of a govermental coat of arms, as a trademark, as a wrapper, or label, or for any commercial purpose whatever, has become a highly important matter.

Scveral recent decisions against such uses have called renewed attention to this question. There is a growing tendency in this country to stamp out the use of governmental symbols for the purpose of private enterprise, which seems to be quite in keeping with a wise public sentiment, says Printers' Ink.

In this we are only following in the wake of the older nations, many of whom have long had prohibitive laws in force.

As is well known the general right to property in a trademark in this country is a matter of common law. It is simply a case of original use, a merchant or manufacturer's right in a trade mark consisting wholly in his ability to establish a claim to original occupancy. This, of course, means a right in the whole trademark as such, and not to any word or mark of which it may be composed separately.

While Congress long ago passed legislation defining the colors and other details of the United States flag, it has never made any laws prohibiting or limiting the use of our national emblem. The nation was young when the flag law was passed, and it is entirely unlikely that any such conditions as have arisen with our great commercial expansion were foreseen.

The absence of a condition always implies the presence of its opposite, as silence is said to give consent. The absence of a prohibitive law thus seemed to create a privilege, which has to a greater or less extent been taken advantage of.

The present National trademark law, in one of its recently added clauses, carries the first definite limitation of the use of goveernmental insignia as trademarks. The exact language of the statute provides that no trademark which "consists of or comprises the flag, or coat-of-arms, or other insignia of the United States, or any simulation thereof, or of any State or municipality, or any foreign nation, shall be registered. Here is a very definite statute covering the situation as far as trademarks are concerned. Previous to its enactment the usage of the patent office for some years had been a refusal to register trademarks of the above character on the general plea of public policy.

The present trademark law carries a ten year proviso which, on its face, allows of the continued use of a trademark, based on or containing governmental insignia, provided it had been in actual use for ten years preceding the passage of the act. But there have been three recent and important decisions by the Court of Appeals of the District of Columbia against this construction of the law on the ground of public policy; and there is good ground for the belief that any ease involving the use of governmental or State symbols, for business purposes, which gets into the courts hereafter will be decided against, in view of these decisions which are now generally recognized as establishing a precedent.

In a recent important case in Massachusetts, the Commonwealth vs. R. I. Sherman Mfg. Co., the Supreme Court of Massachusetts held the State's right to prohibit the use of "the arms or the great seal of the Commonwealth or any representation thereof for any advertising or commercial purpose whatever." A sweeping decision which was followed by the legislative enactment, the manufacturing community being protected against loss, by being given one year to dispose of mechandise bearing the prohibited matter—the law not to take effect until that time.

A very recent decision in Nebraska, the case having gone as far as the Supreme Court, prohibited the use of the United States flag as a part of the label on a beer bottle. It will be observed that while the present National trademark law covers the trademark situation, local cases of various kinds are springing up all the time, and will continue to until each State legislature has molded and passed for itself a definitely prohibitive law with appropriately heavy penalties.

All leading foreign nations have passed prohibitive legislation against the registration of their coat-of-arms as a trademark. These are Great Britain, Germany, Austria, Hungary, Spain, The Netherlands, Sweden, Switzerland, Norway, Peru, Chili, Costa Rica, Bulgaria, Roumania, Servia, Denmark, Brazil and Japan.

"Red Can" Law Soon to Take Effect.

Michigan's "Gasolene Red Can" law, which was passed by the last legislature goes into effect on November 1st, and dealers of the fluid are hastening to provide themselves with material to comply with the provisions of the act. In short, it requires that tanks on automobiles, boats, engines, stoves, and so forth, may be filled only from cans, barrels, casks, and other receptacles that are painted bright red, and stencilled with the name of the fluid. The law makes it unlawful to put kerosene in any can or other receptacle labelled gasolene, benzine or naptha. There is an exception in the case of these inflamable fluids when sold in bottles for cleaning or similar purposes, but the contents must be designated by a label printed in red with letters not less than one-quarter of an inch in height.

COEY IN ROLE OF E. Z. MARK

Chicago Dealer Victimized by Peculiar Systems of Bookkeeping—His Forgiving Spirit Imposed Upon.

C. A. Coey, the Thomas agent in Chicago, has just awakened to the fact that he is one of the "e-z marks" of the Windy City. Some of his ex-employees thought so long ago, but they neglected to say anything about it with the result that Coey has just made the discovery for himself. Now that Coey is fully awake he is felicitating himself that he still owns a few cars. Also, he has placed his present bookkeeper under bonds, and raised his salary above the temptation point.

The trouble with two of Coey's former bookkeepers was that they led automobile careers on wheelbarrow incomes. Coey himself says so and adds that he unwittingly furnished the difference of three wheels and the gasolene. Last week he decided to quit playing the comic supplement character, hence the bonds for the new bookkeeper and a warrant for the arrest of Thomas W. Greer, a former bookkeeper.

Coey states that Greer and his predecessor, M. E. Semple, instituted systems of bookkeeping that were highly unique—so unusual, in fact, that Coey didn't remeber of ever having studied those systems when he went to school in 17—, that is, some years ago.

Last New Year's day Coey discovered that Semple had peculated to the extent of about $400. The man asked for a chance, made New Year's resolutions and promised to pay back the shortage from his salary. By March Coey managed to fathom Semple's system, so he discharged him, wishing that he had done so on New Year's day, as the shortage had grown to twice the original amount, so the dealer avers.

Then he took in Greer, or vice versa. When Coey discovered that Greer could give Semple cards and spades in figuring long on a short column, he was ready to go to the foolish factory. Greer also asked for a chance, and Coey gave it to him. Greer took a long chance, Coey alleges, so long that when he left a week ago the cash register was down and out waiting for the count.

Meanwhile Coey had given the berth to George Cheever, the young man who posed as a nephew of Vice-President Fairbanks, and in this guise procured a $5,000 touring car from Coey, which little joke ended up in the young man's languishment in jail. Coey procured the boy's release upon condition that he would work for him and pay for the damage he had caused. Cheever "worked" him, Coey relates, and now, to insure himself against further losses through his easy disposition, all his employees must give bonds.

MAGISTRATE THREW A BOOMERANG

Pooh-Bah of Pennsylvania Town in Legal Mix-up—Prosecution of Automobilists Develops Back Action.

That a township supervisor cannot be a justice of the peace and at the same time do justice to both offices, has been discovered by Harry F. Taylor, of West Goshen township, Pennsylvania, following a decision in the Chester county courts that has attracted considerable attention from barristers of that section of the State and elsewhere, not alone from the nature of the proceedings but because also of the material effect that the decisions have upon the operation of automobiles over the public highways of the State in relation to the rights and duties of the justices and officers of the various boroughs and townships relative to the arrest of automobile owners and operators regarding alleged violations of the speed limit and failure to sound warning on approaching road crossings.

Early in the summer residents of Willistown and East Goshen townships decided that automobiles were traveling too fast through their bailiwicks, so to slacken the pace they erected warning signs relative to the speed limits. Several Philadelphia motorists were arrested and fined in Willistown township for alleged violations of the State act.

Then Harry F. Taylor, a supervisor of West Goshen township, who also is a justice of the peace, employed Worthington G. Lewis, a young carpenter, to watch the roads of that township for violations of the automobile law. On Sunday afternoon, June 30th, when he concluded there would be a large number of cars out on the road, Lewis took a station in the high grass on the Paoli road, near Goshenville school house, and in three hours jotted down the numbers of 37 or 40 cars that passed, and reported them to his employer, Justice of the Peace Taylor, as having violated the provisions of the law.

Among the number reported were several prominent business men of West Chester, among them being Charles T. McFarland, E. L. Pye, G. Glancy Wilson, H. S. Thompson, C. M. Hicks, C. G. Gawthrop and C. R. Nichols, who in a few days received a letter from Taylor to appear before him and answer to the charge preferred by "Detective" Lewis. The justice informed Wilson that from the testimony presented to him (Taylor) he was satisfied that Wilson was guilty of violating the act. Subsequently regularly prepared warrants were sworn out for a number of the alleged violators, and several of them living in Philadelphia, it is said, paid fines and costs imposed, but Wilson and others demanded a hearing. They were represented by an array of legal talent that almost flabbergasted the "learned" justice.

At the hearing given Wilson, which was made a test case for several of the others, "Detective" Lewis testified that Wilson failed to sound his horn when approaching the cross roads and his testimony was corroborated by William Armstrong, a young man who had gone up to the school house to talk over a game of base ball with a friend, and seeing some of the other persons were putting down the numbers of automobiles, he also for the fun of the thing put down the numbers of three, including that of Wilson. Armstrong testified that it was about five or six o'clock while Lewis had said that it was three o'clock. Wilson and his wife, who was in the car at the time, both testified that the horn had been sounded.

Counsel for Wilson argued that the guilt of the defendant had not been established beyond a reasonable doubt and asked for his discharge, also raising the point that the act makes no provision for a penalty for failure to sound an alarm; that no judge can sit in his own case; he had no jurisdiction in the case, being one of the supervisors who employed the prosecutor, and any judgment against the defendant would be appealed. Justice Taylor, however, imposed a fine of $15 and costs upon Wilson, without having adjudged him guilty on the testimony. Counsel at once moved for a stay of judgment or an execution, pending an appeal to the courts, and requested a transcript of the justice's docket.

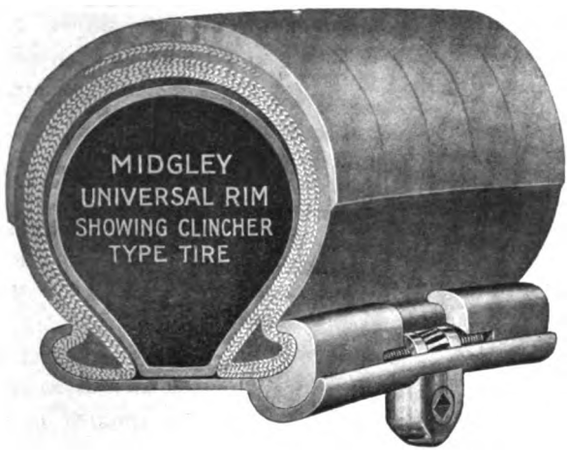
Wilson's counsel filed a petition for a writ of certiorari, praying that Justice Taylor be cited into the court, and a hearing held before the body, the petition setting forth that the justice had no jurisdiction to consider the complaint against Wilson. Taylor was wholly disqualified to hear the case and judge same, because he employed the man who acted as detective, who was the complainant, and was the chief witness at the hearing; the justice employed counsel for the prosecution; the justice employed as his counsel and adviser at the hearing the same attorney whom he had employed to conduct the prosecution; the justice declared before the hearing that he had decided that Wilson was guilty of the offense charged and should be fined; that the justice had admitted that he had partially, at least prepared the case of the prosecution; that the justice refused to give the defendant the benefit of a reasonable doubt; that the defendant is not guilty and suffers much harm from the justice's decision.

When the matter came up on argument befort the court it was shown by testimony that Justice Taylor had not adjudged Wilson guilty, but merely had imposed the fine of $15 and costs. The court reversed the judgment of Justice Taylor and dismissed the proceedings, holding that the hearing before Justice Taylor was irregular and improper, as he was the prosecutor, and so the fine does not have to be paid. Lewis, the prosecutor, has now brought a complaint against Wilson on the same charge before Justice George P. Caley, of Malvern, who after hearing the testimony also imposed a fine of $15 and costs, but this case too, will be appealed to the court for a hearing.

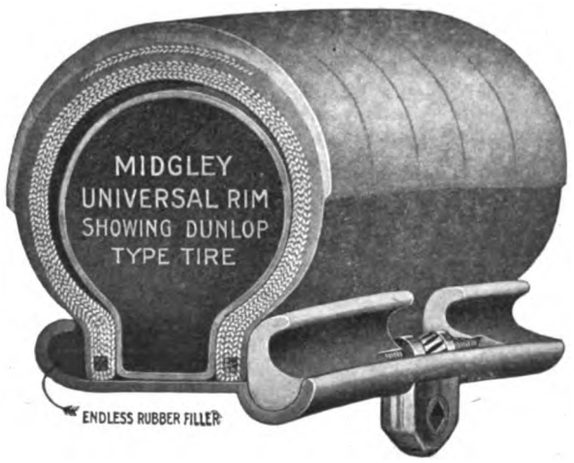
Following the disposition of the case by the court several automobilists who have been fined by Justice Taylor have taken action to recover the fines paid him under the same irregular proceedings as was the fine imposed upon Wilson, and which the court has declared irregular. It is expected that Taylor will get into serious difficulties unless he refunds the moneys so paid, for the decision of the court in Wilson's case, which was the same as the others, reverses the judgment in all such cases.

But here is the amusing part of the case, and where the automobilists got a slap back at the justice for so zealously nabbing and fining them. While Justice Taylor was so occupied in conducting these proceedings against the motorists, he failed as supervisor of the township to properly attend to the roads, as provided by law, and he has been summoned to appear before Justice Russell at West Chester to answer charges of failure to keep loose stones off the highways of the township. And it was only a few days ago that Worthington Lewis was haled before a local magistrate to explain under what authority he acted as a detective without license granted by the court. Lewis was frightened terribly and promised to not play the amateur Hawkshaw in the future. "The automobilists can all go to blazes for all I care," was his ejaculation, and it also is thought that this will be the opinion of Justice Taylor before he clears his skirts of the mess he put himself into.

Atlantic County Withdraws Its Cops.



After three days of service the automobile special officers were "fired" by the the Board of Freeholders of Atlantic County, New Jersey. The director of the board had named four men to guard the roadways leading into Atlantic City, with instructions to arrest the driver of every car that appeared to be exceeding the speed limits, but there was such a vigorous protest from Atlantic City hotel proprietors that the officials were withdrawn.



To Improve Portland-Seaside Road.

The Portland (Ore.) Automobile Club has agitate good roads to such an extent that the much-talked of boulevard from that city to Seaside will be improved. The road is fairly good with the exception of one stretch, which will cost $40,000, and the county has agreed to pay two thirds of the cost if the automobile club will contribute the remainder, which it has agreed to do.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

NANTUCKET'S OBSTINATE FIGHT

Decision in Tyler Case Declares Road Closing Ordinance Illegal—Town Adopts New Law, Equally Exclusive.

Nantucket's war against the automobile is being waged with varying fortune. At the time when W. V. Birney, a summer resident of 'Sconset, at the farther end of the island, was arrested for pushing his automobile into the town a protest against the order of the selectmen closing certain roads was filed with the State Highway Commission, which gave a hearing on the matter. After deliberating from August 14 until September 18 the commission rendered a decision to the effect that the town's regulation was disapproved.

In the meantime there arose the case of Frank J. Tyler, of Boston. Tyler, who took a Maxwell touring car over to the island and drove it on the streets of Nantucket was not subjected to arrest, but got a summons to appear before Justice Mooers, which he evaded by having the magistrate summoned to Boston for a hearing before the Supreme Court to show cause why an order should not be issued restraining him from further proceedings. Nantucket won out on that issue and Tyler had to stand trial, was convicted and a fine was imposed.

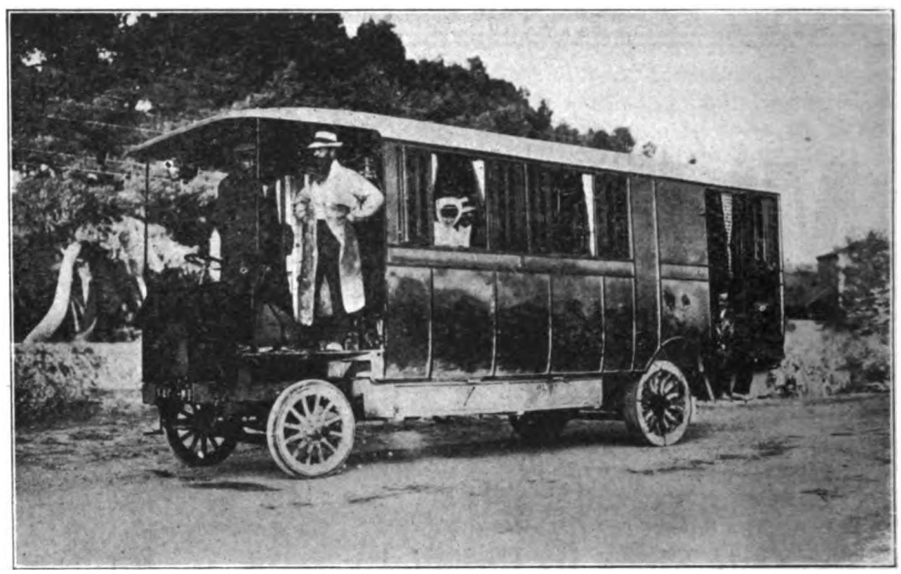
This was a short-lived triumph for Nantucket. Tyler appealed from the local court to the Supreme Court and the case came up befort Judge Edgar Gray Sherman, who celebrated the twenty-ninth anniversary of his appointment to the bench by presiding at the October session of the Superior Court for Nantucket on October 1, and decided in Tyler's favor. His decree declared that the town, through its selectmen, had attempted to enlarge upon the statutes and that the special regulation excluding automobiles from the island was illegal and unconstitutional.

Nantucket recovered sufficiently from this fresh defeat to pass, through the selectmen on October 4, a new order which, while it does not exclude automobiles from all the roads of the island, which was the error made in framing the former law, is practically a shut-out for those vehicles. The order reads:

"Automobiles are hereby excluded from the following particular roads and ways in the town of Nantucket, viz: Broad street, North and South Water streets, Federal street, Centre street, Union street, Orange street, Main street and the Milestone road."

These "particular roads and ways" are the only roadways by which an automobile can either enter or reach the steamboat wharf, and the order, therefore, cuts off all possibility of reaching 'Sconset, or any other part of the island outside of the county town, that wharf being the terminus of the only ferry offering to "outside barbarians" the means of reaching the sacred soil of Nantucket. It is almost certain that a protest against the new order will be filed with the highway commission. Another thing that may be looked for is a very lively opposition to the passage by the next legislature of any such law as the people of Nantucket will ask for, enabling them to enforce such regulations.

Senator Barred from Mule Path.



In Florida the Hon. James P. Taliaferro is a big man, and at Washington he occupies a seat in what sometimes is called the "Millionaire's Club," but which is legally known as the United States Senate. The senator has been a visitor in the Empire State recently and some of his experiences have proved to him, if he needed the proof, that even a United States Senator is not immune from the operation of state laws and regulations. With his wife and daughter and C. S. Hubbard, his son-in-law, he was making his way along a road to Albany, the party occupying two automobiles, when they reached a stretch of macadam road in progress of building near Frankfort. They were held up by an inspector who ordered them off the road, ignoring the senator's rank, as indicated by the personal card handed to him.

Then the tourists headed for the towpath of the Erie canal which parallels the road, but two state employees held them up again. In vain the senator expostulated that the road was closed to him and that he must follow the mule path in order to reach Albany that night. The card he handed to one of the men was thrown into the canal and the senator was informed that the orders of State Superintendent Stevens, prohibiting the use of the towpath as a highway "went" there against everything else. How the senator got to Albany is not material to this story, but he didn't go that part of the journey sacred to mules.

HOUSE BOAT FOR LAND SERVICE

Tourist Provides Himself a Luxurious Home on Wheels—All Conveniences of First-Class Apartments.

Motor cars built on the principle of a private railway car or a suite of rooms at the Waldorf have been attempted on both sides of the Atlantic, the latest creation of the sort being that of M. A. de Fabriques, of the Automobile Club of Marseilles, France, whose outfit is heralded as the most complete and elaborate that has ever taken the form of an automobile. The owner is at present touring all the countries of Europe with three friends and two servants, and the party is happy in its entire independence of both railways and hostelries.

LUXURIOUS PRIVATE HOTEL ON WHEELS

The car, as the accompanying illustration shows, is not unlike an elongated house on wheels. It is divided into three parts. There is a comparatively spacious dining room where eight people may sit comfortably at table and at the back there is a well arranged kitchen. The center division is for dressing rooms and toilet conveniences, as well as for storage space. At night the dining room and kitchen are converted into sleeping rooms, the former for the host and his guests and the latter for the servants. This is accomplished by means of ingenious folding beds or couches, which are not apparent in the day time. On the top of the car is a large water reservoir, with suitable piping to the kitchen, bath room and dressing rooms.

The motive power is supplied by 40 horse engine, capable of driving the car at a fair rate of speed when a move is decided upon. In an excess of zeal, the owner of the outfit declares that nevair will he to a hotel go again.

The Week's Patents.

862,785. Vehicle Tire. William E. Andrew, Atlantic Highlands, N. J. Filed Dec. 30, 1905. Serial No. 294,009.

1. In a cushion tire, a non-pneumatic, resilient body having a plurality of symmetrically arranged longitudinal cushioniing chambers provided with flat bases and symmetrically arched tops.

862,882. Time Speed Indicator, Charles C. Coleman, Chicago, Ill. Filed Nov. 4, 1905. Serial No. 285,819.

1. In a speed indicator for vehicles, the combination of a clock, a rotary device operated by the clock, to carry a record tape, a series of projections on the rotary device to perforate the tape to indicate divisions of time, a printing device located above the rotary device, means associated with the clock for operating said printing device to make printed indications of time upon the tape in correspondence with the perforations, a cyclometer, and means associated with the cyclometer for making a series of distance indications on the tape parallel with the time indications.

862,913. Fountain Sight Feed. Christian C. Hill, Chicago, Ill.; Clotilda Barclay Hill, executrix of said Christian C. Hill, deceased, assignor, by mesne assignments, to Precision Appliance Company, Chicago, Ill., a Corporation of New Jersey. Filed Dec. 23, 1904. Serial No. 238,045.

1. A fountain sight feed, comprising in combination, a trunk member, a cylindrical open side casing secured thereto, a cap screwing upon the upper end of said casing, casing and having a closed upper end and a transparent view tube arranged in said an open lower end, and a jet tube arranged inside of said view tube and attached to the trunk member, the said trunk member having an inlet passage connecting with said jet tube and an outlet passage connecting with the lower end of the chamber, substantially as set forth.

862,963. Vehicle. Charles Cretors, Chicago, Ill. Filed Dec. 27, 1906. Serial No. 439,721.

In a vehicle of the character herein described, the combination of a floor, guide tracks on the underside of said floor and near the rear end of the same, and a drawer moving on said tracks and formed with a deep rear portion and a forward shallow portion, substantially as set forth.

863,064. Friction Clutch. Herman J. Hass, Frederick P. Nehrbas, and James R. Short, Buffalo, N. Y., assignors to E. R. Thomas Company, Buffalo, N. Y. Filed Feb. 21, 1906. Serial No. 302,159.

1. A friction clutch comprising a driving shaft, a driven shaft, means for rotatably coupling or uncoupling said shafts, a driven ring connected with the driven shaft, and two driving rings connected with the fly wheel and adapted to be engaged with or disengaged from opposite sides of the driven ring, and means for holding said shafts against axial movement relatively to each other consisting of a sleeve secured to the driven shaft and provided at its front end with an external bearing flange, a sleeve secured to the hub of the fly wheel and provided with an internal bearing flange, and a row of balls interposed between said bearing flanges, substantially as set forth.

863,095. Automatic Pump for Rubber Tires. Oriel D. Rousseau, Seymour, Iowa. Filed April 5, 1906. Serial No. 310,130.

1. An automatic pump for pneumatic tires, comprising a yielding, compressible, elastic, resilient valve-chamber provided with shoulders at its ends and adapted to be mounted in and communicate with a tire as a section of the tire, valves in the ends of said chamber controlling the communication between the chamber and tire and a valve in said chamber intermediate to its ends and controlling communication between said chamber and the atmosphere.

863,124. Fender for Motor Vehicles. Dante J. Welton, Columbus, Ohio. Filed June 6, 1906. Serial No. 320,372.

1. The combination with the frame of a motor vehicle, of a resilient fender pivoted at its rear to the forward portion of the frame, and rigid vertical brackets supporting the forward portion of said fender at their upper ends.

863,142. Explosive Engine. Louis Bou deaux and Louis Verdet, Paris, France Filed Feb. 24, 1906. Serial No. 302,737.

In an explosion engine the combination of a differential cylinder a differential pis ton adapted to reciprocate within the cyl inder, an inlet and an outlet valve in communication with the lesser portion of the cylinder bore and an inlet and an outlet valve in communication with the larger portion of the cylinder bore, a plurality of explosion chambers some in communication with the lesser portion of the cylinder, and the others in communication with the larger portion of the cylinder, said explosion chambers opening into the cylinder at points immediately above the faces of the piston when the latter is at the end of its in-stroke, and an ignition device arranged in each explosion chamber.

863,145. Change Speed Gearing. Swin fen Bramley-Moore, London, England. Filed Jan. 12, 1907. Serial No. 352,045.

1. A change speed gear comprising a driving and a driven shaft in axial alignment, a sleeve encircling and supporting the adjacent ends of said shafts, a bearing for supporting said sleeve, a countershaft mounted parallel with said driving and driven shafts, a spur wheel on one end of said sleeve, a spur wheel mounted loosely on the driving shaft, a spur wheel mounted loosely on the driven shaft, a spur wheel fixed on the countershaft and in constant mesh with the spur wheel mounted on the driving shaft, a spur wheel so mounted on the countershaft that it is constrained to rotate therewith but is free to slide thereon so that it can be brought into mesh with the spur wheel on the driven shaft, a spur wheel mounted loosely on the countershaft and in constant mesh with the spur wheel on the sleeve, means for coupling the loosely mounted spur wheel on the countershaft to said shaft, and means for coupling the spur wheels on the driving and driven shafts to their respective shafts and the spur wheel on the sleeve to either or both of said shafts, as set forth.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

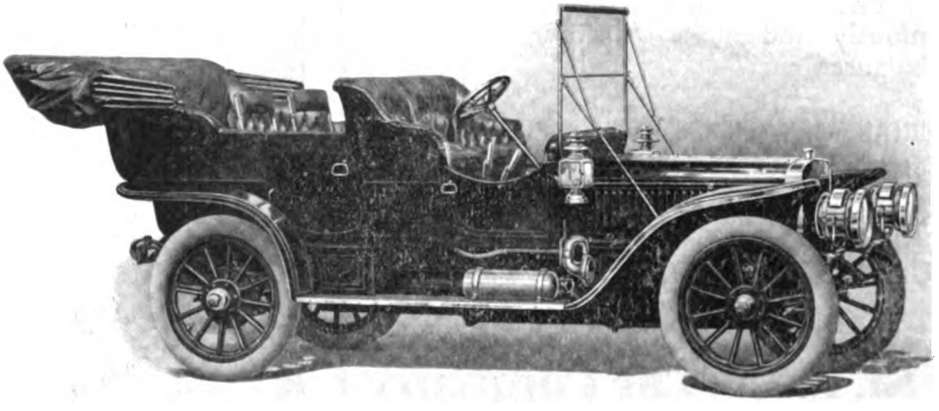
WINTON

"That's The Finest Ride I Have Ever Enjoyed."

Must be a lot of merit in the new Winton six-cylinder Six-Teen-Six to draw praise like that from veterans of the steering wheel—men who have had ones, twos and fours, air-cooled, water-cooled, two-cycle, four-cycle, steamers, electrics and gasolines. Must be a pretty smooth automobile.



We leave it to you, whether it is or not. Try in on the hills—the worst hills you can find, and see it conquer them. Try its speed, and mark if anything gets by. Get into crowded traffic and observe how it creeps cautiously along on the high speed and springs merrily through the first opening. Compare it critically with the best motor car you or your friends have ever owned, and then you'll want a Six-Teen-Six.

Goes The Route Like Coasting Down Hill. Rides like a palatial yacht on a smooth sea. Starts from the seat on compressed air. Ideal in all that makes a motor car worth while, from appearance to performance Output limited to 500 cars, making it the Exclusive Car for 1908. Purchase price includes five bow top, full set of lamps, gas tank or generator, horn, tools and glass front. Made by the only company in the world whose entire plant produces six-cylinder cars exclusively.

"American Mors"

THE CAR BUILT FOR PERMANENCE

You're Sure of Your Trip

When you start in an American Mors you're sure of reaching the destined point without trouble or delay.

No matter what hills, what the condition of the road or other ordinary and even extraordinary automobile obstacles, the American Mors will get you there.

Every part of the American Mors is built to do a specific share of the work—and it does it.

No one part shifts the work on another.

They all work together harmoniously and make "the perfectly balanced car."

AMERICAN MORS TOURING CARS—THREE TYPES:

14-18 H. P., $3,000 24-32 H. P., $5,000 40-52 H. P., $6,000

All bodies of the most Perfect Designs—Complete Equipment

GUARANTEED FOR ONE YEAR

The Ford Line For 1908

AS PER USUAL, will eclipse everything else.

AGENTS ARE ANXIOUS to learn what it is to be—so are our copyist competitors, and we are not telling.

ALL THE PRESENT MODELS will be retained—every one is a world-beater in its class;—not one, has a rival today; nothing others can bring out in 1908 can possibly compete in quality and price.

THE FORD SIX—the car that made the fame of sixes and compelled 27 unwilling makers to follow its lead, will still be made in the two types—the 40 horse power touring car and the "6-40" Gentlemen's roadster. Finish a trifle better, and price a trifle higher perhaps, but otherwise the same as '07.

MODELS "N & S" RUNABOUTS cannot be improved upon. Both are now standard products.

THERE'LL BE ONE new runabout—a light roadster that will show the way to everything else on wheels, quality, price. performance and appearance beyond compare.

TWO OTHER SURPRISES—yes, a light touring car is one of them—that will be the delight of prospective buyers, the despair of competition.

SEE THEM ALL AT THE A. C. A. SHOW: You'll say "the world is Ford's for 1908."

In line for the agency yet?

FORD MOTOR CO., 259 Piquette Avenue DETROIT, MICH.

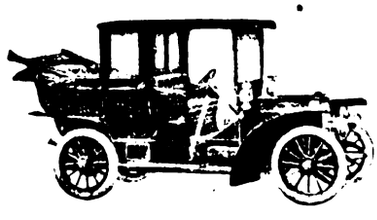
Matheson

Guaranteed One Year



Touring Cars, 50 H. P., $5,500

THE MATHESON is standardized. The few changes for 1908 are unimportant refinements. The great string of Matheson victories during the past season, its new speed records, hill-climbing records, endurance records, its perfect scores galore in reliability contests, made, not only without need of repairs, but without even adjustments, all these have repeatedly proven to us that there is no room for improvement in the Matheson. We have sought in vain for records of performance that would show the need of improvement of even a single feature. Feature for feature through the world's output of high powered cars, there is nothing that can compare with the Matheson for performance over American roads.

This means that the motorist who puchases a Matheson today will have, years hence, a car which will be running as strongly, as reliably, giving as efficient and as economical road service as any high class car then offered for sale. The Matheson is so strong, so swift, so powerful, so simple, so economical, so luxurious, so beautiful, so utterly without a peer, that no use of ink and paper can convey to you its greatness in entirety. Write for our new booklet, "I Drove My Matheson," by Matheson owners, some of whom have driven 5,000 mile trips at an upkeep cost of 5 cents—some for less.

Rain or shine its all the same in the Cadillac coupe.

$1350 F. O. B. DETROIT

THE IDEAL PHYSICIAN'S CAR.
THE IDEAL SHOPPING CAR.
THE IDEAL OPERA CAR.
THE IDEAL CAR

for any purpose where a two passenger enclosed motor vehicle is desired.

The Cadillac coupe comprises our regular Single Cylinder Chassis with an enclosed body.

It is suitable for every day in the year, warm or cold, rain or shine, for city streets or country roads. In cold or inclement weather the occupant is almost as well housed as he would be at his fireside. In pleasant weather the front and rear windows may be lowered and the side windows opened, permitting ample air circulation.

If desired, the coupe body can be removed and the regular runabout body substituted for use during the summer.

This

Cadillac

with its gasoline motor, has many advantages over cars using other methods of propulsion. There are no noxious odors. You may replenish the tank with gasoline almost any place and be on your way in a few minutes.

The Cadillac coupe is luxuriously upholstered and trimmed and richly finished both inside and out. It has every mark of dignity and refinement, with the pre-eminent Cadillac characteristics of thorough dependability and economy of maintenance.

Cadillac dealers can make prompt delivery.

Ask us for Special Coupe Booklet and descriptive catalog.

CADILLAC MOTOR CAR COMPANY, Detroit, Mich.

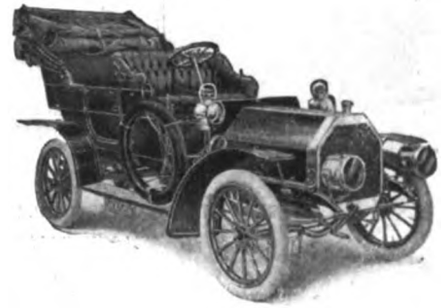
DRAGON

1908 Roadster

35 H. P., $1850



Exhibited at the Independent Show, Grand Central Palace, New York City, October 24 to 31

Four 4½ x 4½ inch cylinders, cast in pairs; valves on one side; progressive type transmission, located on rear axle; I beam drop-forged front axle, roller-bearing rear axle; 96-inch wheel base; drop frame of pressed steel; storage battery ignition; speed up to 55 miles an hour; weight 1,800 lbs.; cone clutch, leather-faced; brakes, 14-inch drums, metal to metal internal and external; ball-bearing front axle and gear box; Diamond tires 32 x 3½ inches. The price includes full equipment of five lamps, horn and tools.

The Dragon Touring Car of 1908

The success of our 1907 touring car has induced us to put a similar model on the market for 1908, embodying all the good features of the 1907 car, together with such improvements and refinements as have been found desirable and necessary. It has all the advantages of correct design, fine workmanship, absolutely best material, handsome appearance and perfect performance on the road. Excessive speed was not the object in designing the Dragon, but it will take you forty miles an hour when you care to travel that fast. Write for information.

24-26 H. P., five passenger, full elliptic springs, wonderfully easy riding, silent shaft drive, double hub brakes—$2,100 f. o. b. Philadelphia.

Announcing The Marmon 1908 Models

Air-Cooled and Water-Cooled

IT HAS long been a matter of common knowledge among automobile experts that the Marmon offers more distinctive features of marked mechanical excellence than any other car.

We offer this season the culmination of progressive design and thorough construction in two strikingly beautiful models.

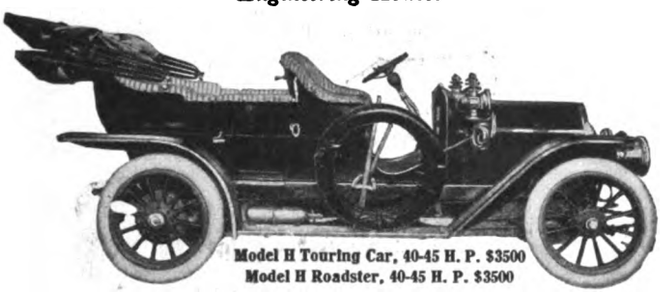
We offer, with increased confidence, the latest improved Marmon Air-Cooled Motor, which for many years has proven its efficiency under all conditions of hard service.

One of the new features of this remarkable motor is the Marmon One-Piece Detachable Cylinder Head, removed or replaced in a moment, dispensing with valve cages entirely, reducing engine noise to a minimum, and making the valves, pistons and cylinder walls easily accessible.

To those who prefer water-cooling, we offer the Marmon Water-Cooled Motor of latest approved design, which, like the Marmon Air-Cooled Motor, is built and fully warranted by this house.

Marmon Touring Cars are much longer and roomier this year. The body hangs low and is designed in a gracious straight-line effect.

All models embody the exclusive features which have won the Marmon its fame for mechanical superiority, such as Double Three Point Suspension, Marmon Lubrication, Roller Bearing Steering Column, Marmon Multiple Disc Clutch with Cork Inserts and Marmon Selective Transmission.



These and other distinct advantages in a car of exceptional quality and high repute cannot fail to convince the man who wisely seeks real mechanical merit in a mechanical product.

A full description of all models will be furnished promptly by Department 12.

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

A SEASON OF WHITE VICTORIES

White Bulletin No. 14, which has just been issued, gives a resumé of the victories of the White in the important contests of the year. The various chapters of the Bulletin bear the following headings:

The White in World-Wide Use
The President at the Wheel
Continued Government Favor
First Place in Loudon Town Carriage Contest
Perfect Score in Harrisburg Endurance Run
Fastest Time in Wilkes-Barre Hill-Climb
Fastest Time in Cleveland Hill-Climb
Fastest Time in California Hill-Climb
Perfect Scores in Sealed Bonnet Contest
Officially Observed Non-Stop Run of 1871 Miles
Only Perfect Score in Quaker City Regularity Run
Fastest Time of the Season on the Track
Perfect Score in California Endurance Run
Officially Declared Most Efficient Car
Wins Third "Desirability Contest"
The Glidden Tour—A Clean Sweep for the White

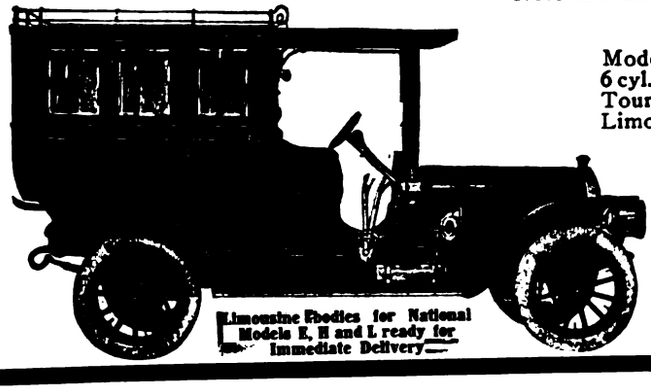
states a plain truth about the success of Morgan & Wright Tires

A *National* PROPHECY FULFILLED



In the Fall of 1905, when we brought out the

First Stock Six Cylinder Car Made in America

we stated in our advertising

THAT IT WAS "An Innovation in Touring Cars"
THAT IT WAS "A car very much ahead of the times"
THAT IT WAS "A car which would be extensively copied in the near future"

Note the number of manufacturers who are NOW building six cylinder cars.

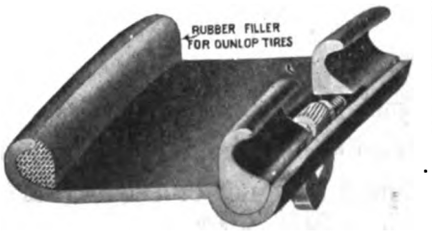
MORGAN & WRIGHT TIRES have won a commanding place in the tire field thru persistent making good

We want to emphasize that word "won."



It requires an entirely different kind of a tire to win business than it does to secure it. It is one thing to sell a motorist one set of tires, but it is quite another —and a bigger—thing to sell him a second set of the same kind. Salesmanship may sell the first set, but merit must sell the second.

And it is by this merit method that MORGAN & WRIGHT TIRES have won their way to prominence in the "auto game."

Tough rubber stock, superior-grade fabric, our method of tire building, and perfect vulcanization—this is the "compound" that makes up into GOOD tires.

FOR CLINCHER

FOR DUNLOP
(Note rubber filler in clincher on left.)

The Improved Midgley Rim, illustrated above, accommodates every make of Clincher or Dunlop tires, as well as every type of mechanically-fastened tires, except one. Standard measurements thruout, including inside diameter. Solid bead.

Rainier

"The Pullman of Motor Cars"

GUARANTEED FREE OF REPAIRS FOR ONE YEAR

OUR NEW PLANT, FROM WHICH IS COMING THE 1908 "MODEL D," TO ADD TO RAINIER FAME.

SOUND business economy demands that in selling a car under our original and distinctive guarantee, "Free of repairs for one year," that the chief expenditure must be at the beginning, that is, at the factory and, in material and construction, instead of in the local repair shops: Therefore our new factory at Saginaw, Mich.

The new plant comprises sixty acres of ground, with spacious brick buildings, in which every piece of machinery is new and specially designed for building the RAINIER. Nothing has been omitted that would tend to insure accuracy and superlative quality. James G. Heaslet, the original designer of RAINIER cars, is responsible for the 1908 RAINIER, which is higher-powered and more strikingly than ever a "Pullman" in quality and finish. "Quality, not quantity," is our factory watchword, and the 1908 output has been limited to 300 cars.

Rainier

"The Pullman of Motor Cars"

GUARANTEED FREE OF REPAIRS FOR ONE YEAR

1908 "Model D," 45-50 H. P.

SPECIFICATIONS

ENGINE—Rated H. P., 45-50; four cylinders, vertical, cast in pairs; 5-inch bore, by 5¼-inch stroke; cylinders hard gray iron castings, accurately ground to size; pistons light but rigid, ground to fit; valves on opposite sides, mechanically operated, all interchangeable; cams forged integral with shafts; crank shaft nickel steel forging, with bearing surface ground; main engine bearings and connecting rod bearings of finest babbitt metal, enclosed in bronze cases, a construction the same as that in the highest priced imported cars.

IGNITION—Make-and-break system, with Simms-Bosch, low tension magneto, but with a greatly improved and simplified mechanical sparking device, insuring accurate timing and minimum need for adjustment; one upright ignition shaft in place of four.

LUBRICATION—Positive feed mechanical oiler, driven by gear from the cam shaft, provides for engine bearings, magneto and pump shaft; Cylinders and pistons fed by splash system.

CARBURETER—Improved automatic type, having auxiliary air control on dash; feed by gravity flow through trap and screen; Capacity of gasoline tank, 20 gallons, two in reserve.

COOLING SYSTEM—Extra large radiator with fan running mounted on a pedestal over the timing gear case; fan belt runs vertically, driven by a pulley directly on the crank shaft.

CLUTCH—Multiple disc, alternate bronze and steel plates, running in oil; very sensitive touch.

TRANSMISSION—Selective type of gears, four speeds forward and one reverse, direct drive on third speed; shafts and gears nickel steel, and shafts mounted on imported ball bearings; counter shaft located below driving shaft, enabling use of sealed bearings, thereby avoiding oil leakage.

PROPELLER SHAFT—Nickel steel, with new and improved universal joints; driving pinion forged integral with the shaft.

REAR AXLE—Driving axle of floating type, with hubs mounted on tubular axle which carries the weight of the car; drive is bevel gear through clutch driven hubs; driving gear housings manganese bronze, while differential case is drop forging.

BRAKES—Hand and foot brakes, mounted on rear wheel drums, both interior expanding; hand brake pulls towards operator.

FRONT AXLE—Drop forging, manganese steel, I beam section; wheel hubs mounted on imported annular ball bearings.

WHEELS—36-inches with 1⅝-inch spokes, second growth, grade A hickory.

TIRES—Rear 36 x4½-inch, front 36 x 4-inch. Make optional.

FRAME—Pressed nickel steel, with 2½-inch drop forward of rear axle.

CONTROL—Spark and throttle on steering wheel, with stationary segment and foot accelerator pedal.

MUFFLER—Cut-out on all cars.

WHEEL BASE—119 inches.

SPRINGS—Front, semi-elliptic; rear, improved type of platform or three point suspension; size of springs greatly increased; quality of spring steel is most expensive and finest obtainable.

BODY—Double side entrance, seven passenger capacity, full aluminum, ironed for top; extra seats can be folded or removed instantly.

EQUIPMENT—Two acetylene head lights, generator, two oil side lights, oil rear light, large horn, brass coat rail, brass foot rest, tire carriers, trunk rack, tool box on step with full set of tools, including pump, jack and tire repair kit.

WEIGHT—2,850 pounds.

PRICE—$4,500.

Rambler
Automobiles

For the year 1908 the entire facilities of the Rambler factory will be devoted to the production of two Models, 34 and 31.

Model 34, a five-passenger touring car with four-cylinder vertical motor, 32 horse power, has selective type transmission with shaft drive. The wheel base is 112 in., wheels 36 in., with 4-in. tires. Price, fully equipped, $2,250. The same chassis, however, with appropriate changes in detail, will be equipped with a roadster body with rumble seat, at the same price.

Model 31 is a five-passenger touring car with detachable tonneau, equipped with the Rambler unit power plant, comprising double opposed motor, multiple disc clutch and planetary transmission entirely enclosed. Price, fully equipped, $1,400. This model can be furnished with torpedo deck in lieu of the tonneau, at $1,300.

Both models have been brought to the highest possible degree of perfection in every detail that insures

Service, Economy and Comfort

A complete line of 1908 Ramblers will be shown at a private exhibit at the salesrooms of the Homan & Schulz Company, 38-40 West 62d Street, New York City, during both New York Automobile Shows.

You cannot afford to miss making a critical inspection of these 1908 models of

The Car of Steady Service.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, October 17, 1907. No. 3

PONTIAC TAKES UP MOTOR CARS

Big Buggy Company to Build Enlarged Brush Runabout—Brush Himself Engaged as Engineer.

The formation of the Oakland Motor Car Co., Pontiac, Mich., an off-shoot of the financially strong Pontiac Buggy Co., marks the determination of another of the big carriage makers to reach for what looks to them like plums on the automobile tree.

The Oakland people seem to have made a good beginning, as they have secured Alanson P. Brush as their vice-president and consulting engineer, and will place on the market a big brother to the Brush runabout, that is, a two-cylinder vertical motor of 20 horsepower, with a new Brush balancing device, and Brush planetary transmission, wood frame, shaft drive, 96-inch wheel base, 30-inch wheels and pneumatic tires. A touring car and rumble runabout, will be offered, at about $1,250.

The contemplated output is one thousand machines, the motor, transmission and axlesets being made by the American Ball Bearing Co. of Cleveland, O., so that the Oakland Motor Car Co. themselves will merely do the assembling and bring into play their excellent facilities for body, upholstering and finishing work.

The officers of the company are: Edward M. Murphy, president and general manager; A. P. Brush, vice-president and consulting engineer; Martin L. Pulcher, secretary and treasurer. The old factory of the Pontiac Buggy Co. will be employed in producing the cars.

Moon Separates His Interests.

The Moon Motor Car Co., St. Louis, Mo. which last week was incorporated under the laws of that State with $175,000 capital, has purchased the automobile department of the Jos. W. Moon Buggy Co., and will, of course, conduct it as a separate organization. The officers of the new company are: Jos. W. Moon, president; Stewart McDonold, vice-president; Alfred Moberly, treasurer; Geo. W. Shelp, secretary; E. J. Moon, assistant secretary, and L. P. Mooers, general manager and chief engineer. It is the intention of the new officers to largely increase the output for 1908. They also intend shortly to move into a factory of their own; at present they are located in the Moon buggy plant.

Million Bid for Pope-Toledo Plant.

At a meeting of the creditors of the Pope Mfg. Co., and the Pope Motor Car Co., in Chicago on Saturday last, A. E. Schaaf, manager of the Pope-Toledo plant, submitted an offer for the purchase of that property. He was ready to pay $1,000,000 for it, $400,000 in cash, the remainder in bonds. The creditors viewed the proposal favorably, but Receiver Pope did not think the sum tendered was sufficient and a temporary deadlock resulted. Schaaf is said to be acting for Charles H. Schwab in the matter.

Dragon May Go to New England.

It is not improbable that the Dragon Automobile Co. will leave Philadelphia. The matter has been under consideration for some time and was given a serious turn last week when President John Kane Mills and other officers of the company visited several towns in New England in which factory facilities has been proffered.

Tweedy to go with Federal.

O. S. Tweedy, formerly with the Diamond Rubber Co., has contracted to become sales agent of the Federal Rubber Co., of Milwaukee, Wis., makers of a general line of rubber goods and specialties. Tweedy will not assume the duties of the office, however, until January 1st.

Hall to Operate Buffum Plant.

Bicknell Hall, of Taunton, who purchased the bankrupt plant of the Buffum Automobile Co. at Abington, Mass., will operate as the Hall Mfg. Co. He will continue the production of eight cylinder cars.

FORD'S TRIPLE SURPRISE

Detroit Maker Discloses Three New Models at Startling Prices—Landaulets and Taxicabs for $1,000—Ford and his Methods.

Detroit, Mich., Oct. 14.—If there are those who lulled themselves with the notion that Henry Ford and the Ford Motor Co. was resting on the laurels gained by reason of their popular priced four cylinder runabout and six-cylinder touring car, they will have reason for a startling awakening. For far from resting on laurels or anything else, Ford and his associates have quietly been preparing another series of sensations, one of which, at least, will prove in the nature of forked lightning, not only at home but abroad.

There are three cars in the series, and while the prices have not been definitely fixed, the approximate figures are known and they are of a nature that will cause the trade to gasp. The cars, which are illustrated elsewhere, will be exhibited at the Grand Central Palace show in New York next week. An advance view of them was accorded a Motor World man by Mr. Ford himself.

First and foremost and in itself little short of astounding, is the Ford landaulet and taxicab, with a four cylinder, 20 horsepower motor, shaft drive, wheel base of 97 inches, 30x3½-inch tires, weighing but 1,600 pounds, and which will list at the astonishing figure of about $1,000, complete.

With its appearance is partly explained Secretary James Couzens's recent extended European trip. It transpires that Couzens booked orders for 5,000 of them while abroad. They are to be employed in taxicab service on the streets of London, Berlin, St. Petersburg, and even in dear Paris itself. The Paris order alone was for 2,000 of them.

That they will bring into being taxicab

Digitized by Google

companies in the leading American cities and seriously interfere with the more expensive foreign product, seems certain. Of course the price itself is staggering. When the cab, clean cut and eye-pleasing, beautifully finished and upholstered was revealed by Mr. Ford and the approximate price named, the Motor World man was moved to protest. But the Henry Ford characteristic at once asserted itself.

"That's all it's worth," he snapped.

It was suggested that double that price easily could be obtained for every one produced—a suggestion which merely served to bring out more of the Ford philosophy in quick-fire epigramatic reply.

"You can never sell many of anything for more than it's worth," he responded.

"That's what it's worth," he went on. "It's the price we set for it in the first place, and it's the lowest price at which it can be made and sold in the largest quantities. By at once setting the price at that figure, competition is eliminated before it starts."

"Look here," Ford continued rapidly, "look what we saved yesterday on one contract alone! On one part the cost of dies was $1,400. To build one hundred machines would be $14 each. On the 10,000 we will build it will be 14 cents each. Work that same thing through the whole car and you can get some idea of how we are able to do it. There's vanadium wherever there is stress, the cab weighs only 1,600 pounds and it will wear better and be far cheaper to maintain than anything of its kind in the world."

As if this taxicab were not enough, Ford led the way to a natty looking touring car.

"About $800, with 30x3½-inch tires," was all he said. It was enough.

Near by was an attractive looking runabout with rumble seat.

"Same chassis. About $600," and he smiled grimly.

"I'll have some more things to tell you

(Continued on Page 112)

Massnick to Make Brush Transmissions.

The Massnick Mfg. Co., Detroit, Mich., have taken out an exclusive license to manufacture for the trade the transmissions made under A. P. Brush's patents. As the company have a well equipped machine shop and are thoroughly familiar with the work, they are able to undertake contracts in quantities and to guarantee deliveries.

Touring Cars Hatching in Nebraska.

The Angus Automobile Co., Angus, Neb., are preparing to bring out a four-cylinder car; they are asking for quotations on materials in lots of 50 and 100.

Detroit Auto-Vehicle Bankrupt.

The Detroit Auto-Vehicle Co., Detroit, Mich., last week was formally adjudicated bankrupt. The referee has called a creditors' meeting for Tuesday next, when a trustee will be selected.

In the Retail World.

Orchard & Co., with a local minister as president, has opened for business in Fort Scott, Kansas. The company will handle the Ford.

The Newby Automobile Co., New Castle, Ind., have contracted for the erection of a garage at that place. It will consist of two stories, 42x132 feet.

Aubel & Wood, Akron, Ohio, are erecting a new brick and concrete garage on East Buchtel aveue, near Main street. Its dimensions are 70x100 feet.

Ellingson Brothers, Sioux Falls, S. O., who heretofore have transacted only a repair business, have expanded. They will now handle the Cadillac and have fitted up show rooms.

F. A. Brodhead has been appointed manager of the Dragon Automobile Co.'s Philadelphia branch. He formerly was secretary and manager of the American Automobile Co. at Atlantic City.

The Denver Omnibus and Cab Co., Denver, Col., opened its large garage at Court Place and Sixteenth street last week. The building is one of the largest in the State, consisting of four stories and basement. It cost, with machinery, $100,000.

The sales of the Studebaker cars in the entire territory east of the Alleghenies has been placed with the Studebaker Bros. Co. of New York. This increase of territory has led to the appointment of C. F. Redden as automobile manager of the New York house.

Fred W. Freese, Dr. Albert E. Bulson and C. T. Pidgeon are forming a company, to be capitalized at $20,000, to operate a garage at Fort Wayne, Ind. A two story 60x80 building will be erected. The new company will probably merge with the Fort Wayne Company.

The Pullman Auto Co., Sixth street, Portland, Ore., was last week visited by the sheriff, who closed the shutters. Thomas C. Devlin, receiver of the Oregon Trust and Savings Bank, filed a $10,00 attachment suit against the company which was indebted to the bank for that amount.

The Linkroum Automobile Co., Newark, N. J., has succeeded the Linkroum Smelser Automobile Co. The change was made necessary through the death of L. W. Smelser in an automobile accident at Morris Park several weeks ago. S. H. Stern, formerly manager of E. Lamberjack & Co., has been engaged as manager of the new company.

Everett B. Taylor, of the Taylor Automobile Co., 113 Telegraph avenue, Oakland, Cal., has disappeared leaving behind him liabilities amounting to $7,500, mostly in unsecured notes. His creditors claim that he has due him from the Moyer Automobile Co., for which he was acting as agent, over $5,000 and a writ of attachment has been filed against that money.

Cimiotti Bros., metropolitan agents of the Mora car, have leased the premises of 1843 Broadway, New York, as a sales room, whilst retaining their well equipped garage at Broadway and 110th street. Though this is their first year with the Mora car in New York they have made a good start and laid the foundations for increased business. The new location brings them into the heart of the new "automobile row" north of Columbus Circle.

The Week's Incorporations.

Cleveland, Ohio—Garford Motor Car Co., under Ohio laws, with $50,00 capital. Corporators—N. J. Webster and others.

Cleveland, Ohio—Cuyahoga Motor Car Co., under Ohio laws, with $25,000 capital. Corporators—C. M. Steinbrenner and others.

New York City, N. Y.—Ajax Battery Co., under New York laws, with $25,000 capital. Corporators—W. B. Davis, C. E. Gaylord and W. T. Jones.

Kansas City, Mo.—Automobile Livery Co. of Kansas City, under Missouri laws, with $2,000 capital, fully paid. Corporators—Pearl D. Karshner, George Horn and J. H. Karshner.

Boston, Mass.—Morrison & Price Co., under Massachusetts laws, with $25,000; to deal in automobiles. Corporators—President, A. S. Price, Medford; treasurer, B. A. Price, South Boston.

Newark, N. J.—Hydro-Carbon Machine Co., under New Jersey laws, with $50,000 capital; to manufacture carburetters. Corporators—James H. Marjey, William H. VanAlstine and Alexander Ostler.

New York City, N. Y.—Longacre Motor Co., under New York laws, with $1,000 capital. Corporators—John J. Archer, 1345 Broadway; H. Hovey Hill and George A. Pulsifer, 70 West 43d street, New York City.

Baltimore, Md.—Atlantic Rim Co., The, under Maryland laws, with $20,000 capital; to manufacture automobile supplies, rims and tires. Corporators—Thomas H. Gaither, Joseph B. McMullin, George R. Gaither Smith, Edward M. Hammond.

New York City, N. Y.—Ward Equipment Co., under New York laws, with $300,000 capital; to manufacture equipment for automobiles, railroads and steamboats. Corporators—J. E. Ward, T. A. Ward, New York City; F. M. Ward, Yonkers; F. H. Bates, Brooklyn, and A. L. O'Shea.

New York City, N. Y.—Riverside Auto Supply Co., under New York laws, with $30,000 capital; to deal in supplies, etc. Corporators—William H. Atkinson, 728 Classon avenue; John A. Green, 563 Seventy-second street, Brooklyn; H. C. Bebee, 163 West Eightieth street, New York City.

Brooklyn, N. Y.—Broadway Automobile and Garage Co., under New York laws, with $100,000 capital; to deal in automobiles and operate garage. Corporators—Theorore F. Archer, 140 Union avenue; Leander B. Faber, 72 Alsop street, Jamaica; Charles Reinhardt, 756 Flushing avenue, Brooklyn.

DE LISSER ON WESTERN OUTLOOK

Reports that Dealers Anticipate a Record Business Next Season—The Class of Cars that Sell Best.

That the West has paid little attention to Wall Street and that automobiles are selling just as fast as ever, particularly those of the small type, is the opinion formed by Horace De Lisser, president of the Ajax-Grieb Rubber Company, as a result of his coast to coast trip in the interests of Ajax tires.

"While the backward season undoubtedly had something to do with the let-up in the demand for big cars," said Mr. De Lisser, "the good weather brought about a strong demand and next year all the western dealers look for a record business. Those cars selling for $2,000 or less are having a particularly good run. As might be expected, there are some few machines that are not in demand, but that is something that applies to any other line of business. The good always will be in demand while the poor always must be difficult to market. There is an almost unlimited field for business in California, Washington and Oregon."

Ajax tires, Mr. De Lisser stated, have met with their full share of favor out West. To increase the share he inaugurated two new branches, making five in all on the coast, viz.: San Francisco, Oakland, Los Angeles, Portland and Seattle.

Rainier Increases Its Directorate.

Following the establishment of their factory in Saginaw, Mich., several slight changes were made in the personnel of the Rainier Motor Car Co. At the annual meeting, held at the New York offices last week, two members were added to the board of directors, and the office of second vice-president and chief engineer was created and filled by the election of the Rainier designer, James G. Heaslett. The new directors are Jack A . Rainier, son of John T. Rainier, and Harry T. Wickes, the latter of Saginaw, Mich. The others all were re-elected as follows: John T. Rainier, president and treasurer; Paul N. Lineberger, vice-president and general manager; James G. Heaslett, second vice-president and chief engineer. Directors: Paul N. Lineberger, George C. Comstock.

Hollander Gets Fiat Agency.

As was generally expected would be the case, E. R. Hollender and his associates have obtained the American agency for the Fiat car, which therefore was relinquished on Monday last by the Hol-Tan Co., of which Mr. Hollander once was the "Hol." To further his enterprise, Hollander has formed the Fiat Automobile Co. of America, of which he will be vice-president and general manager and A. G. Hamilton, secretary. The names of the president and treasurer have not yet been disclosed. These officials are said to be the owners of an importing house which handles another car.

To obtain the agency, the new concern is said to have placed an order for a minimum of 500 cars, which was more than the Hol-Tan Co., with ripe experience as a guide, would consent to meet, hence the change. The New York edition of James Gordon Bennett's Paris Herald has also made a spread-eagle announcement for the new Fiat representatives that "henceforth" the Italian chassis will sell for the same prices as cars of American manufacture, viz.: from $3,500 to $7,500 plus $1,000 for bodies. The Herald's "sensation" will cause to smile all those who are familiar with the real prices that have been obtained for very many foreign cars during even this year of our Lord 1907.

Electric Vehicle Elects Officers.

To fill the vacancy caused by the resignation of M. J. Budlong, W. G. Henderson has been elected president of the Electric Vehicle Co., Hartford, Conn. Previously Mr. Henderson was treasurer of the Electric Storage Battery Co., of Philadelphia. Concurrent with his election to his new office, three other of the Electric Vehicle officials were moved up a notch, J. B. Entz becoming first vice-president, H. W. Kyte, second vice-president, and Henry W. Nuckols, secretary and treasurer. Former president Budlong, who has just returned from abroad, is said to be considering an offer to assume the management of a New York establishment.

Bay State Finds Strain too Great.

After setting out with high hopes about a year since, the Bay State Automobile Co., 112 Norway street, Boston, made an assignment to Attorney J. J. Irwin, on Tuesday last for the benefit of its creditors. Although not many cars were produced, the concern's liabilities are about $75,000; it is possible that the assets may equal that sum. Lack of capital and stringency of the money market are given as the causes of the failure.

Brandt Suffers Sudden Attack.

E. H. Brandt, sales manager of the Corbin Motor Vehicle Co., New Britain, Conn., was taken violently ill on Thursday last and was at once removed to a hospital where an operation for appendicitis was found necessary. Following a serious turn, his condition was at last reports said to be hopeful.

Franklin Reports Big Increase.

According to a report from the H. H. Franklin Mfg. Co. their orders for special deliveries already in hand are 42 per cent. greater than last year. They also state that reports from their Southern traveler indicate an increase of at least 50 per cent. in that section of the country during 1908.

DIAMOND WILL AGAIN "STAND PAT"

Settles Doubt by Announcing Its Policy—No Price Reductions and no Untamed Competition for Business.

Competition in the field of quality only, is the text and essence of the formal 1908 announcement of the Diamond Rubber Co. It is made public this week, and bears the signatures of A. H. Marks, chief of the manufacturing end in the Diamond factories, and W. B. Miller, general sales manager.

The greater expense of the Diamond Wrapped Tread method of manufacture is pointed out and the statement made that if prices were reduced on Diamond tires it would force the abandonment of the wrapped tread Diamond tire, developed only by years of effort and large outlays of money. The company will entertain no such suggestion, but on the other hand, will not solicit business on a competitive price basis. The trade and public are asked to consider quality before price, and ultimate economy in the purchase of tires, rather than first cost.

The Marsh rim's successful record is also conspicuously mentioned. As to price of both tires and rims, net lists have been published and they are for everybody, whether novice or expert, owner or chauffeur, without any manner of discrimination.

The somewhat famous "stand pat" announcement of The Diamond Company a year ago is in every particular reaffirmed. At that time, the announcement made it appear possible that the big concern might "cut loose" in 1908.

Referee Appointed for Importers.

Edwin B. Root has been appointed referee in bankruptcy for C. A. Tileston & Co., the New York automobile importers, who failed last week. The firm assets, it is understood, are covered by a chattel mortgage for $6,750, held by the Riverside Bank.

Smalley Files Its Schedules.

Schedules field by the Smalley Motor Co., Grand Rapids, Mich., disclose assets of $134,418.84 and liabilities of $112,854.33. Of the latter amount $20,000 is represented by first mortgage bonds and $65,000 by sums due the local banks.

Oliver is Now the Index.

The Oliver Instrument Co., Minneapolis, Minn., has changed its name to Index Speed Indicator Co., to conform with the nature and title of its product. H. E. Pence still remains the hand at the helm.

Another Runabout from Pontiac.

The Pontiac (Mich.) Spring & Wagon Works are working on a $600 runabout; they expect to have it ready to exhibit at the New York show.

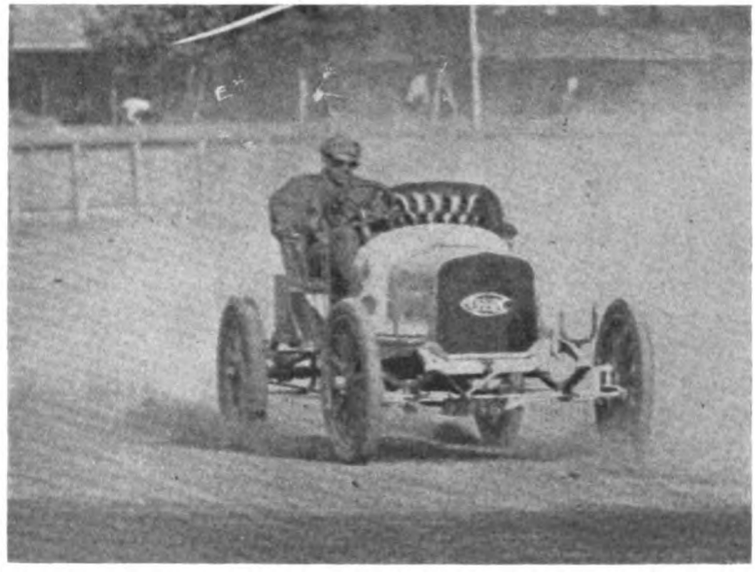
"Famous Apperson Cars"

This is the first time in years that the dealer has had an opportunity to secure and represent the Apperson Line.—There is a good reason. Ask us what it is. Correspondence with reliable dealers is solicited.

The Line and Prices

Model J. R. 50-55 H. P. "Jack Rabbit" Runabout, $5,000. Speed 75 miles per hour. Immediate delivery.
Model K, 50-55 H. P. Touring Car, $4,200. Equipment—5 lamps, horn, generator, set of tools, folding top, robe rail, foot rest, tire carrying irons and trunk rack. Immediate delivery.
Model M, 30-35 H. P. 4 passenger Roadster, $2,750. Equipment—Folding top, 5 lamps, generator, horn and set of tools. Delivery about Nov. 1st.
Six Cylinder, 50-55 H. P. Touring Car, $5,000. Equipment—5 lamps, generator, horn, set of tools, folding top, robe rail, foot rest, tire carriers and trunk rack. To order. Delivery after November 1st.
"Big Dick", 96 H. P. Runabout, 2 passenger, racing type, $7,500.
"FAMOUS APPERSON CARS" are the strongest, and for their rated horsepower, are the fastest cars built in the world.



Dealers' Opportunity— Owing to the increased quantity of production, we shall appoint a few Apperson Dealers. Therefore, we shall be glad to negotiate with reliable dealers who are in position to give the Apperson line the representation it merits.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, OCTOBER 17, 1907

The Motor World's Show Numbers will bear dates October 24th and 31st and November 7th.

Effect of the Big Figures.

Promoters have been given not only a new lease of life, but have been supplied with more toothsome bait than ever has been dangled before a gullible board of trade.

For during the past week the estimated production of the automobile industry for the year 1907 has made its appearance. It places the total number of cars produced at 55,000. Individual editorial fancies have multiplied this number by sums ranging from $2,000 to $3,000, according to their average valuation of cars, and in this way the value of the year's product—or "the amount received by the automobile manufacturers," as one paper expressed it—is estimated to be between $110,000,000 and $165,000,000.

Such impressive arrays of figures constitute a prodigious mouthful and if the crafty promoter does not turn them to his advantage and a new crop of suc—, that is, prospective factories, does not result, it will be cause for remark. There are not many country or half-country towns possessed of boards of trade that will not greedily bite at the hook which seems to hold a "piece" of such magnificent wealth.

While there is no way to prevent it, the publication of such figures is in the nature of a misfortune. Represented as the sums received by the automobile manufacturers, they simply strengthen the too popular notion that automobile manufacturing is a short cut to fortune and that those engaged in it are rolling in money, which is but another term for prosperity. The populace takes no account of the immensity of the costs of production and sales, and would smile cynically if told that it is doubtful if more than 10 per cent. of the automobile manufacturers have earned a profit. It is notable that the public statement of a prominent maker to that effect did not obtain very wide or very conspicuous circulation, and yet it undoubtedly is near to the truth.

Pessimism will serve no purpose, but the industry will be well served if a few of its strong men will but come out into the open and frankly let it be known that the business has been overdone—that it has been overcrowded, and that it no longer is a boom business nor an El Dorado. It may assist in preventing a few country "boards of trade" and "business men's associations" from succumbing to the wiles of the glib tongued promoter and to this extent at least the situation will be bettered and the future be safeguarded.

Little Things That Are Neglected.

Perhaps it is not too much to say that no single feature of the average car can be called in question as to its suitability or general reliability in action. All cars have their own specific weaknesses, but the frailties of one are usually found to be remedied or otherwise eliminated in another. Certain points, however, generally display a greater tendency to developing failures than others, and most of these are such as have to satisfy the simplest requirements and present the least difficulties to the designer. Sundry little improvements which are greatly in need, and are almost self-suggestive, also are being pretty generally ignored.

Thus, while the fuel tank of the average car no longer evinces a tendency to break away from its fastenings and whip around under the seat, or drop off altogether onto the road, it is far from perfect, as is its location and method of attachment in many instances. Sometimes the feed pipes are not laid out with due care, but are strung up any old way with more regard to economy of tubing than satisfactory results in use. But perhaps the most trying fault in this connection arises from the lack of provision for the periodical cleaning out of the tank. A few makers provide hand holes with suitable covers, which are useful not alone for this purpose, but also in making repairs, closing leaks, taking out dents, and refitting broken or leaky connections. In most cases, however, when even a small amount of dirt once finds its way into the tank, it must either be rinsed out through the filling cap, to do which the tank must be dismounted from its cradle, or else it must be allowed to remain until it finds its way through to the strainer, and probably to the carburetter as well.

Happily there is no longer the occasion for finding fault with the careless methods of installing the wiring of the average car, that existed a year or two ago. Yet in all too many instances, the wiring proves to be the least permanent part of the mechanical equipment, whereas there is no reason why it should not be as permanent as the coil, once properly located and protected, supposing only that proper provision has also been made for disconnecting the terminals occasionally, when it becomes necessary to replace the batteries or clean the timer.

The same fault finding attitude may be assumed in the inspection of nearly every organ of the entire machine, and certain minor discrepancies found at every joint. Thus while the generality of makers are paying close attention to the matter of brake construction, both as regards stability and durability and actual braking strength, facilities for adjusting the brakes, and methods of compensation, remain much as hitherto. Steering connections and universal joints on propeller shafts and other connections are carefully worked out, but the driver is left to his own discretion in the matter of lubricating them, save in a few of the larger cars, where grease cups are provided. Other instances showing a general tendency to neglect or ignore the little things which mean so much to the

Digitized by Google

driver, might be given and in deplorable number.

For the most part, such minor deficiencies are chargeable not so much to the basic design of the car, nor even to the designer, as to the faulty processes of final production which leave no room in the hurry of assemblage for the close attention to small details which is required for absolute success. Even going a step further, it may be said that in too many cases the work of the designer is stopped, not where it is most required, but where it is greatly in demand to round out and perfect that which already has been done. The design of a car is not complete until the exact nature and location of every last ounce of material to go into it has been indicated after careful consideration of all the requirements. In this particular respect many American makers show a deplorable weakness, and one which in the end proves as expensive as some of the more prominent mistakes of the past, which have shown to far worse advantage.

Limiting Power of Racing Cars.

In the mass of suggestion that has been proffered that track racing may be rendered safer, Henry Ford's idea of restricting competition to cars employing motors having a piston displacement not exceeding 250 cubic inches stands out clear cut and distinct. It strikes at the root of the trouble and is in line with the Motor World's suggestion that it is time to limit the power of cars employed in track contests. As Mr. Ford maintains, 250 cubic inches allows ample scope for ingenuity and permits of all the speed that is necessary for practical purposes.

Of course, the piston displacement plan is not a new one. It was considerably discussed two years ago but nothing came of it. The A. A. A. permitted the suggestion to pass unnoticed, as so many other deserving suggestions have been permitted to pass—that is, until mischief has been done. Although it probably is unknown to the A. A. A. and to most of those concerned with automobiles, the piston displacement limit already obtains in this country so far as motorcycles are concerned and has proved a most effective regulation, not only for the sport but, in a measure, for the trade as well, in that it has made the manufacture of freaks of abnormal power unprofitable. The body that governs motorcycle sport in America did not wait for tragedies to occur before providing safeguards. Several distressing fatalities had occurred abroad to both competitors and spectators, exactly as they have recently occurred in automobile racing in this country, and profiting by this experience and for no other reason, the Federation of American Motorcyclists established a limit of 5 horsepower for machines eligible to competition.

In due course, the term horsepower being elastic, trade rivalry led to the construction of machines bearing that rating, but manifestly of much greater power, and that were close to the danger point. Again, the motorcycle organization did not dodge the issue or cry out to the trade for help. It met the "trade rivalry" more than half way by promptly wiping out the horsepower definition and substituting therefor an inelastic limit of 61 cubic inches piston displacement, and there it stands to-day. No machine of greater capacity is permitted in a track contest. The few freaks of abnormal power that exist are restricted to straightaway trials and even then their performances go for naught. They are not booked as records. It is to be added that in the five years' history of motorcycle racing in America, there has been but one fatality and no broken bones; and even motorcycles have a reputation for "going some."

Doubtless the idea that anything is to be learned from the modest little two-wheeler will be poopoohed in many directions, but the fact remains that the wise man will profit by the experience of others, it matters not who they may be. Having made automobile sport a mere annex of the trade and, therefore, being fearful of doing anything which may offend the trade, whether the A. A. A. really is in a position to take a stand for piston displacement or anything else that, while making for real safety, would render some cars unavailable for speed purposes and cause a trade outcry, is an open question.

COMING EVENTS

October 18, Middletown, Pa.—Motor Club of Harrisburg's race meet at Middletown track.

October 26, Allentown, Pa.—Race meet at fair grounds track.

October 24-31, New York City—Automobile Club of America's eighth annual show in Grand Central Palace.

November 2-9, New York City—Association Licensed Automobile Manufacturers' eighth annual show in Madison Square Garden.

November 9-16, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show at First Regiment Armory.

November 15-16, Newark, N. J.—New Jersey Automobile and Motor Club's 24-hour endurance contest.

November 26, 27, 28, Chicago, Ill.—Chicago Motor Club's three days' 600-mile reliability run.

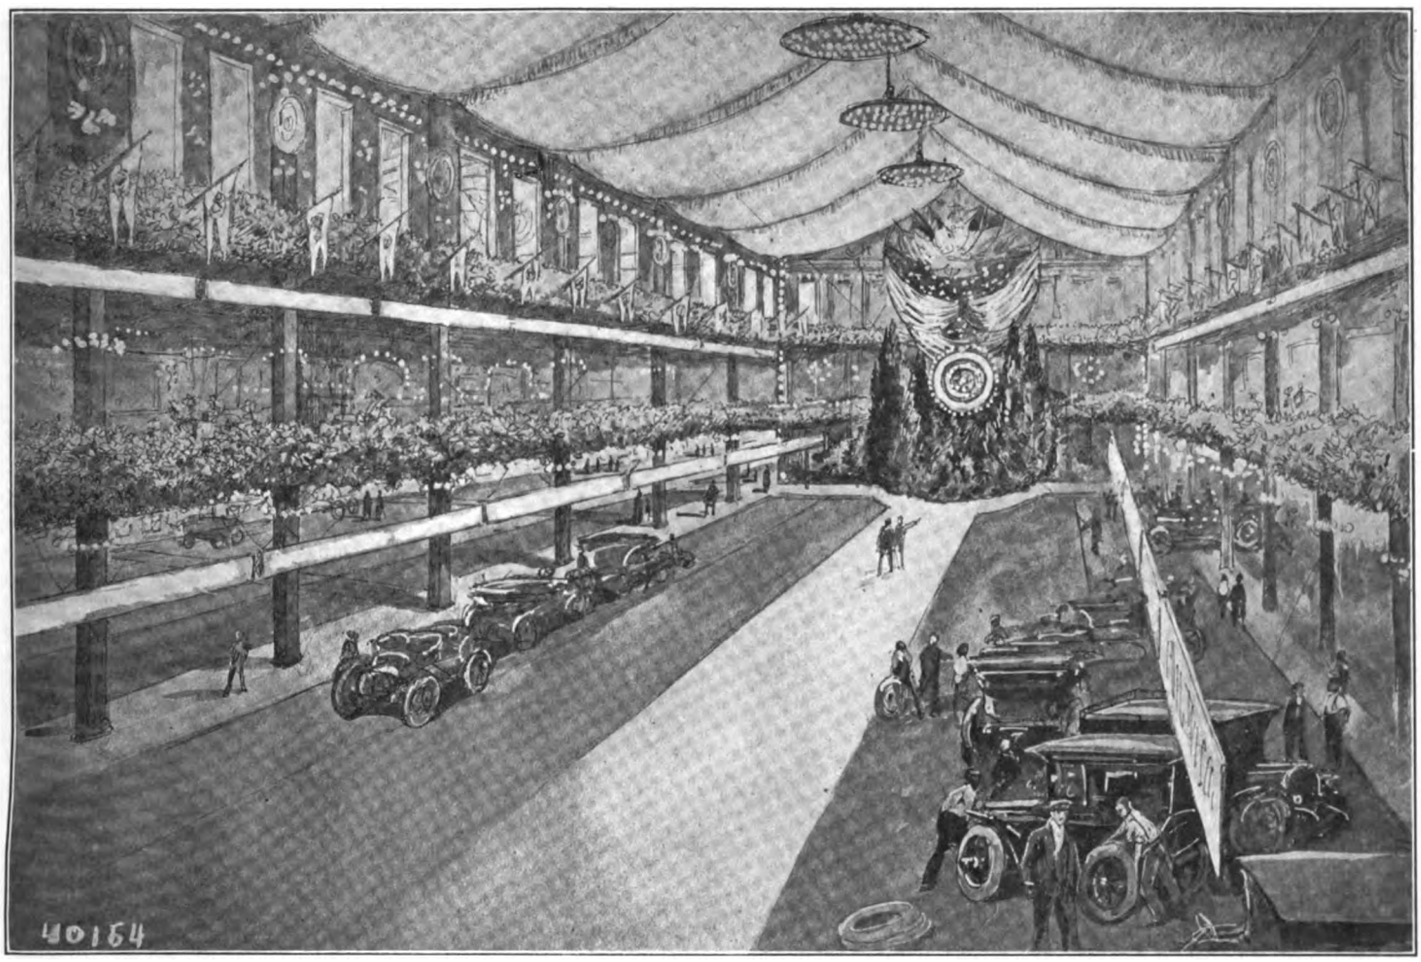
November 30-December 7, Chicago—National Association Automobile Manufacturers' first annual exhibition of commercial motor vehicles in 7th Regiment Armory.

November 30-December 7, Chicago—National Association Automobile Manufacturers' Annual show in Coliseum and First Regiment Armory.

December 9-14, Detroit, Mich.—Detroit Automobile Dealers' Association's show at Wolff's pavilion.

January 14-18, Hartford, Conn.—Hartford Automobile Dealer's Association's annual show in Foot Guard Hall.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sportsmen's Association's show in Light Guard Armory.



April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association show in Duquesne Garden.

It may not occur to some of the gentlemen who are permitting themselves to be used for a more or less hopeless and misguided "road race for stock cars" for C-h-a-r-i-t-y'$ sake," that charity sometimes wears a commercial veil. For instance, what a perfectly lovely affair such a charitable function may prove for, say, an importer who had undertaken the tall task of selling several hundred foreign cars in America! We once heard of a hill climbing contest "pulled off" by a press agent—not in his own name, of course—in order that a couple of specially built cars, which had been designed for another purpose, might be exploited, the program being so arranged that they scarce could have failed to do so.

A press agent is worthy of his hire and if he can "deliver the goods" he is entitled to all he receives, but it matters not how much of a good fellow he may be, the fact remains that there should be no room for road races promoted by press agents, it matters not how much he may disguise or conceal himself behind another name, or how many good natured and obliging, but unsuspicious, gentlemen he may find willing to permit themselves to be "used" to further his purposes.

AUTUMNAL WOODLAND SETTING FOR PALACE SHOW

INTERIOR OF GRAND CENTRAL PALACE SHOWING PLAN OF DECORATION

While the Grand Central Palace, New York, does not readily yield itself to decorative treatment, the manner in which it will be "dressed" in its autumnal garb for the Automobile Club of America's eighth annual show is portrayed by the accompanying illustration.

The liberal use of natural boughs and leaves banked up against the columns, panels and balconies of the building will form an harmonious setting for the cars that will be staged. They will also convey that suggestion of out-of-doors which properly belongs with the automobile. Not only does the decorative scheme thus take cognizance of the motor car as an outdoor vehicle but it also pays tribute to the season, the reds and yellows of the autumn leaves providing sufficient color to give real decorative value.

The autumnal woodland effect will of course be supplemented by garnishments of a more artificial sort, such as banners and flags, and at the end of the building an immense replica of the Automobile Club's insignia wil be shown. But the preponderance of restful green will give the various shades and gaieties of color on the glistening automobile bodies a chance to shine individually to advantage, without being "killed" by any powerful color theme in the general decoartions. The soft, irregular lines of the foliage will also soften the hard, conventional form of the building's interior into an attractive embowerment.

For the Charity Road Race!

If Thomas Francis Moore, publicity promoter and general all-around good fellow, does not "deliver the goods" it will not be his fault. After resting from his labors as toastmaster at a luncheon designed to attract guests to a Broadway hotel, he plunged with renewed zest into his "charitable" project, a road race for stock cars to be held in the spring. He wrote dozens of letters to manufacturers extolling the glories of such charity and as he has time to burn he paid visits to other tradespeople to whom he sang the same sweet song.

On Tuesday last, Mr. Moore, who is sometimes known as the Metropolitan Automobile Association, held a meeting in a New York hotel at which replies to some of his letters were read—those that favored the "charity"; for there were others that were very pointed in their failure to appreciate Moore's benevolence. Mr. Moore's most obliging "executive committee," Robert Lee Morrell, presided at the meeting and very kindly announced that it was not Moore's, or rather his vest pocket association's intention to assume the control of automobile sport, whereon two other elderly and good natured gentlemen made the motions that a charity road race was very much to be desired—the very motions that Moore himself would have made. There was also some talk of a $1,000 entry fee before the meeting adjourned. The importing trade was quite numerously represented. Moore now feels much better. He had been quite pale, as on the very morning of his meeting, a cog in his scheme slipped somehow, the big New York daily with which his once side partner in the "charity" is connected, declaring that the road race, the course in Westchester county, and even the big trophy he had talked about, were merely "dreams."

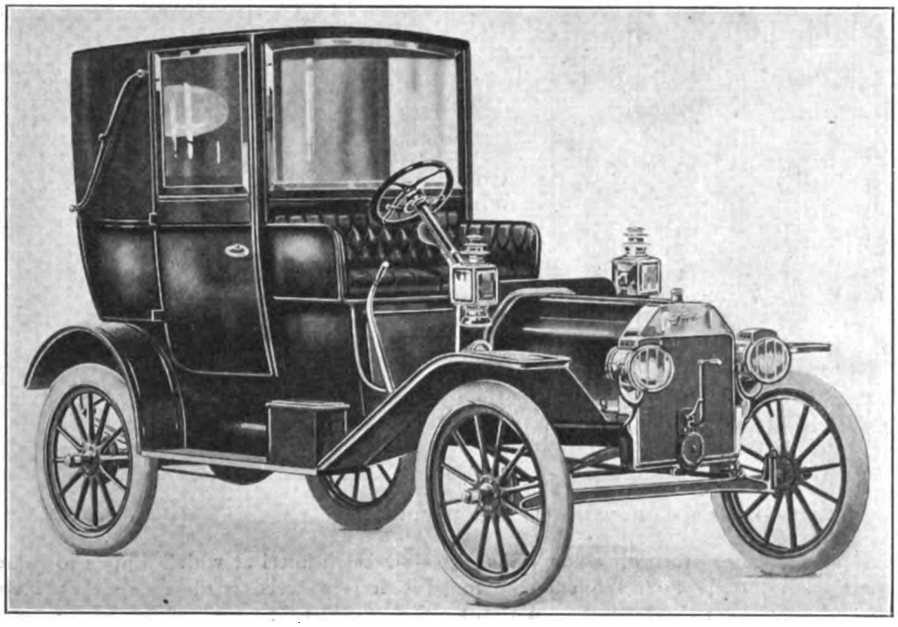
FORD'S TRIPLE SURPRISE

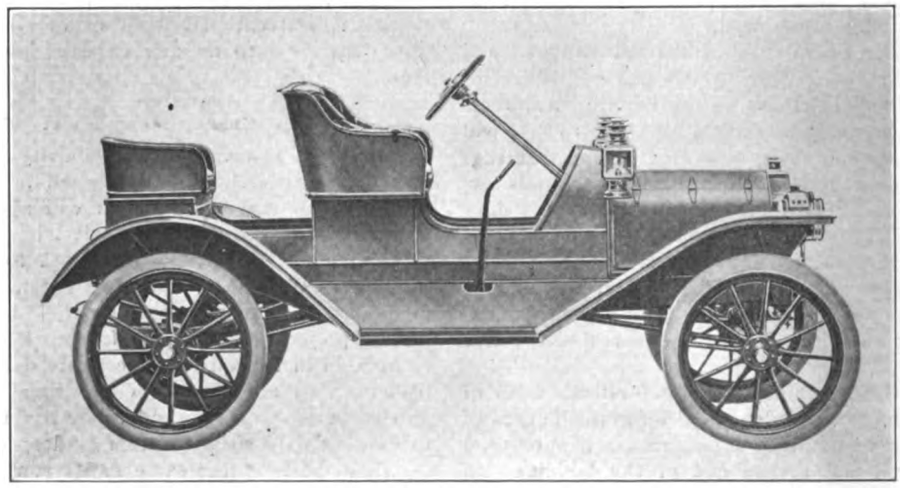
(Continued from Page 106)



at the New York show," was Ford's parting shot.

The Ford Motor Company, according to general report, now has about $1,250,000 lying idle in the banks, and Henry Ford solemnly declares the company will build 25,000 automobiles the coming season. This year's output was approximately 10,000 machines.

The daring which is contained in these plans and prices will serve anew to call attention to the man responsible for them Henry Ford has ever been an independent thinker. Never, even in his earlier and leaner, much leaner, years has he followed a beaten path or taken any man's judgment before his own, preferring instead to shape his own course and steadfastly follow it, turning a deaf ear to any and all attempts

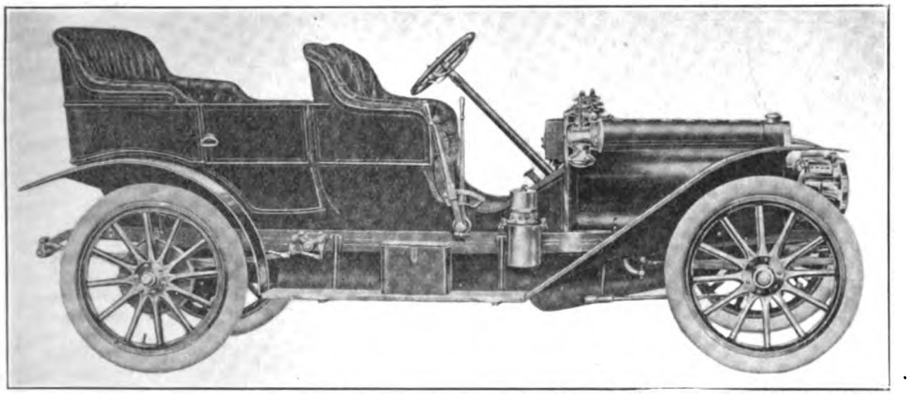


20 HORSEPOWER FORD TOURING CAR

FORD LANDAULET AND TAXICAB

to swerve him from it. In other words Henry Ford cannot be "controlled." He is not what the political conservatives would call a "safe" man. Far from it. He has deliberately flouted trade customs and usage, and confounded the prophesies of commercial disaster that arose on all sides.

He is a man who appears to be sufficient unto himself. He is his own designer; his own manufacturer; he is his own financier. He has no use for a lawyer except to have him do in legal form that which he wants done. The wisdom of it he considers his own affair. And yet Ford's activities are limited to a directing capacity. As he himself says, he does not, and never did, work hard. All he now wants is to have the "boys" associated with him make money. He is the firmest kind of a believer in entrusting responsibility to those who have "made good" with him, and he stands back of his men to the last ditch. His own tastes are simple in the extreme. His time is largely spent in riding alone along the country lanes in one of his famous little runabouts or in his den at the factory where he exercises his hobby of taking to pieces and repairing old watches, for he is a watch maker of no mean ability. These diversions and working on his farm occupy most of his time and it is probably during these hours his active mind conceives the things he is to do and there are born the mechanical creations that have made him famous. For success has been written large on the banner of Henry Ford. He is a factor to be reckoned with and it serves no purpose to disguise or deny that truth. That he is keenly alive to his opportunities also is apparent, not only in the nature and prices of his product, but in the timeliness and results of Couzen's trip abroad and in the results also of the carriage show in New York last week. For, be it known, the Ford cars were there and a great "killing" was made in respect to the volume of orders placed by carriage dealers.



FORD RUMBLE RUNABOUT

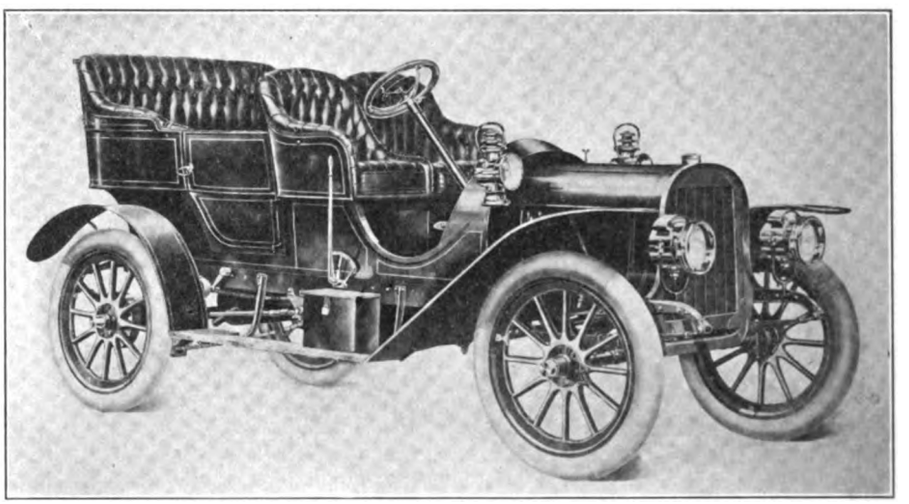
Digitized by Google

THE CARS FROM KENOSHA

Two of Them, Both Ramblers, of Course—Four Cylinder Model Planned on Practically New Lines.

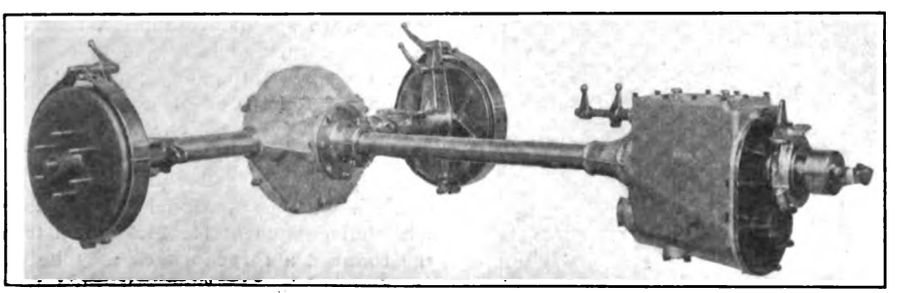
Although it was announced some weeks since that the Rambler line for 1908 will consist of but two distinct models, each of which will be furnished either in touring car or runabout form, it was not until this week that Thomas B. Jeffery & Co. definitely made known the mechanical details of the product of their Kenosha (Wis.) plant. These details indicate that the 1908 Ramblers will be among the most improved cars on the market.

FOUR-CYLINDER RAMBLER



Of the more important improvements developed in the case of the larger four-cylinder car, which is to be known as Model 34, may be instanced the motor, which is entirely new, the selective type change speed gear, heavy brakes, large wheels, and semi-eliptical springs, which are used both in front and in the rear. The motor, which is of the conventional quadruple, vertical, type, differs from those employed in previous models, principally in the use of valves placed on the right hand side of the cylinders in offset pockets, and worked directly from below, instead of being mounted in the head and actuated by means of long plunger rods and overhead walking beams. In addition to this feature, however, the somewhat exceptional nature of the crank case, which is of new design and so contrived that an unusually large amount of working room may be obtained by the removal of the side plates without disturbing any of the adjustments, also is noteworthy, as is the method of suspension. This comprises a stout tubular member running tranversely of the frame, and supporting a forward extension of the case, and a dropped cross member at the rear, upon which the motor is cradled. The case is of the non-divided type, and the crank shaft with its rear and center bearings adjusted in place, is slipped in from the rear.

The transmission—change gear, propeller shaft and live rear axle—externally is much the same as was used last year. Several points of difference are to be found, however, particularly in the case of the change gear, which is of the selective type. Like the axle, the entire group runs on Timken adjustable roller bearings. The neat design of the system, as well as the unusual feature of actuating the gear striking rods from the rear instead of the front end of the gear case, are made apparent by the accompanying illustration.



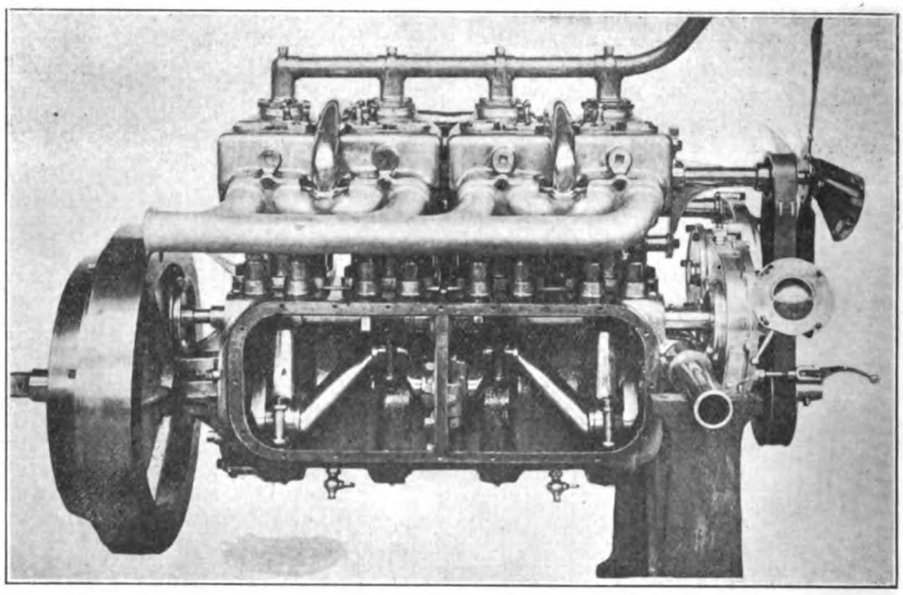
The wheels are of new design, taking 36 by 4-inch tires, and have unusually large brake drums, 13 inches in diameter by 2½ inch face, the aggregate of surface for the duplex system amounting to something like 410 inches. The drums are heavy steel stampings, bolted to drop forged hubs. The semi-elliptical springs are set very low, those in front being almost flat, and are made up of comparatively thin leaves, thus giving an exceptionally easy riding vehicle.

Another feature, which is common to both types is the steering gear, the pillar of which has been altered somewhat, a new 17-inch wheel being installed, which carries the control levers for the motor, both of which are above the plane of the wheel and work over circular segments in the popular style.

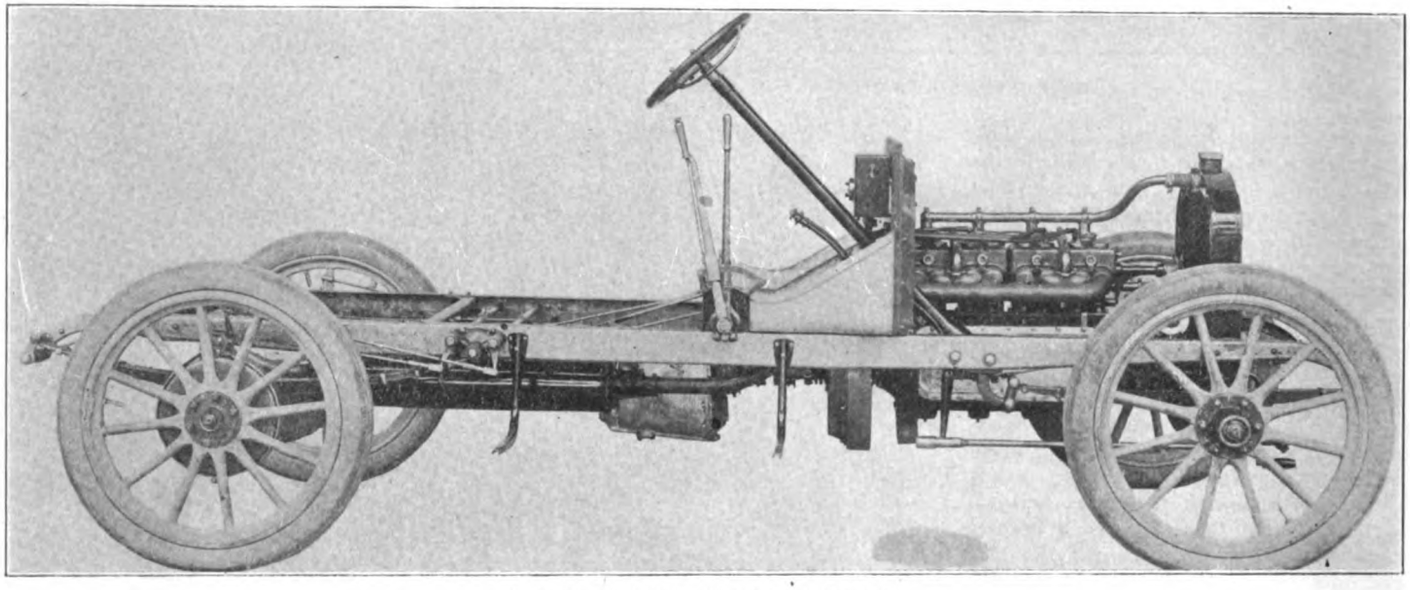
The roadster or runabout equivalent of this type has a three-passenger body, raked steering column, front axle carried forward of the radiator, and alluminum flooring. Altogether it is a very neat and racy looking machine, well suited to the purpose for which it has been worked out. The price of both this and the large touring car will

TWO-CYLINDER RAMBLER

COMPACT RAMBLER TRANSMISSION

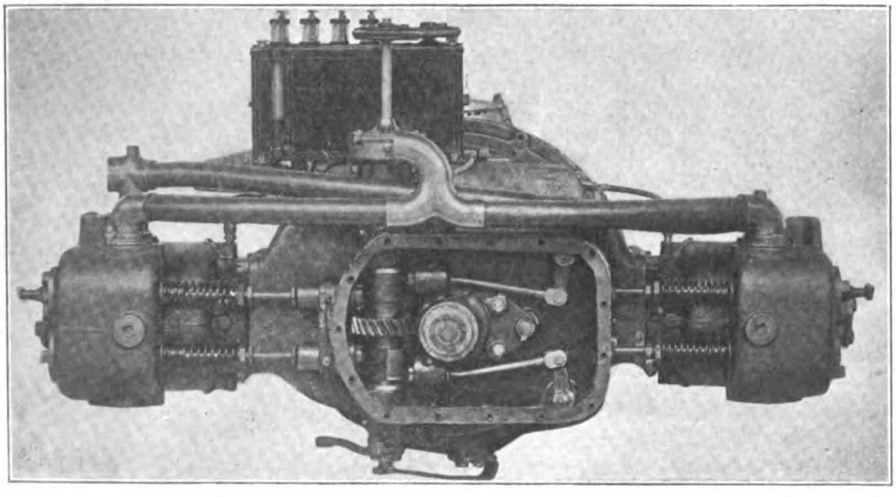


NEW STEERING WHEEL



Digitized by Google

be $2,250, which includes the full touring equipment without top.



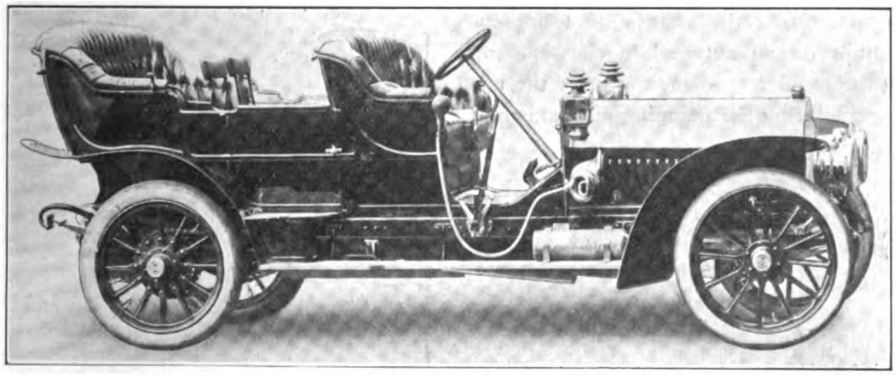
Among the several improvements which mark the new two-cylinder model may be instanced the power plant, which, while still of the unit type, as was the case last year, has been altered considerably. The double-opposed horizontal motor is retained, but the valves are now placed at the side of the cylinders instead of over them, thus necessitating the adoption of a somewhat modified valve gear. This consists of a single vertical camshaft, working in a compartment at the side of the crank case, and actuating the valves by a direct thrust motion. The two-to-one gearing is of the worm and pinion type, and permits the use of a release mechanism for starting purposes, thus eliminating the necessity of employing the noisy petcocks for this purpose. The cylinders are 5 by 6 inches in measurement and are water jacketed all around, a special allowance being made for cooling the heads. The bearing area of the

FOUR-CYLINDER MOTOR, SHOWING METHOD OF MOUNTING

CHASSIS OF FOUR-CYLINDER RAMBLER

TWO-CYLINDER MOTOR, SHOWING VALVE GEAR

motor has been increased 50 per cent. The outboard bearing beyond the change speed gear is of the anti-friction type, mounting ¼-inch balls.



As to the change speed gearing, as heretofore, it is completely encased, and runs in an oil bath. A considerable increase in the size of the brake bands, has been made, however, and the lever by means of which the forward speeds are applied, now works in a quadrant, and is locked in each position, thus preventing any possibility of its jumping into or out of gear through the vibration of the car. The wheels are shod with 34 by 4-inch tires. The regular model is equipped with a five-passenger tonneau body, is known as Model 31, and is sold with full equipment for $1,400. Instead of the tonneau a torpedo deck may be fitted, on requisition, the runabout thus formed selling for $1,300.

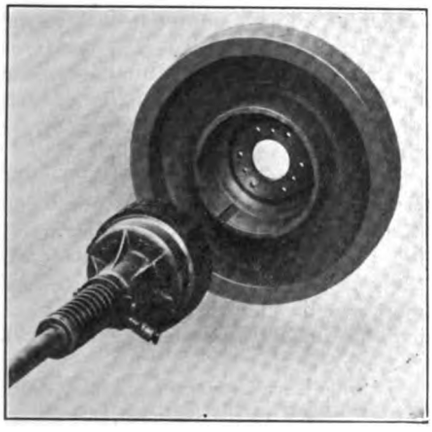
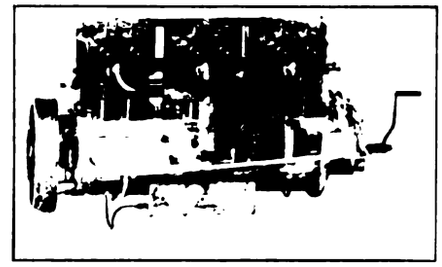
AMERICAN LOCOMOTIVE MODELS



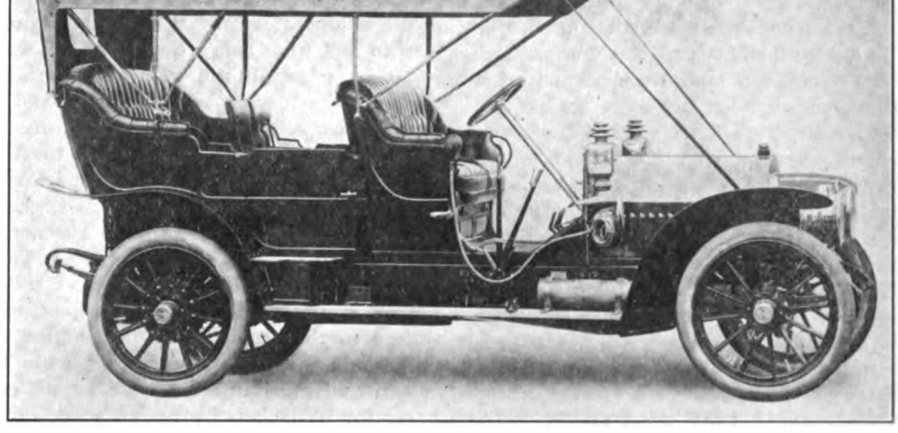
New Six Cylinder to be the Leader for the Season—Changes Made in the Four Cylinder.

During the period of the two New York shows, the American Locomotive Automobile Co. will flock by itself at the Waldorf-Astoria with two of its three 1908 models of what is this year to be known as the American Locomotive Motor Car, instead of the "American-Berliet" or plain "Berliet" of the past.

FOUR CYLINDER AMERICAN LOCOMOTIVE



The leader of the trio is entirely new, being a six cylinder rated at 60 horsepower, and offered as a car remarkable for compactness, lightness, power and flexibility. It has the same length wheel base as the 40 horsepower four cylinder car, 126 inches, and weighs only 300 pounds more. The cylinders are 4¾ inch bore by 5½ inch stroke and are so compactly grouped as to give a bonnet no longer than that on many four cylinder cars. The car has direct drive on both third and fourth speeds, and this year the manufacturers have taken to high tension magneto ignition instead of the make-and-break. Double chain drive, selective transmission of the sliding gear type, with four speeds forward and reverse, multiple disc clutch and four generous brakes, constitute some of the other features. With a full load of passengers the car is capable of 70 miles an hour on an average road. Equipped with a touring or runabout body the price is $7,500, and with a complete limousine it is $8,500.



AMERICAN LOCOMOTIVE CLUTCH

The four cylinder 40 horsepower model, which has been the leader for the past season, has undergone several changes. The radiator has been moved slightly back of the front axle, the fan flywheel has been discarded and a cast iron flywheel substituted, and a belt driven fan placed directly back of the radiator. The lubrication has been changed to a concealed tank and sight feed and force pump. The steering gear has been made more rakish. No changes have been made in the ignition or carburation and the same multiple disc clutch and direct drive on third and fourth speed are used as heretofore. The control levers have been changed to bring the brake lever outside the gear shifting lever. The four cylinder, 40 horsepower model lists at $6,500, with an extra thousand for a limousine or landaulet body.

In the light car a complete change in the drive has been made, side chains being abandoned for a shaft to bevel gears. This model, which is rated at 22 horsepower, is intended largely for town use. Its chief features are a four-cylinder motor, selective transmission with four speeds forward and a reverse, direct drive on the high speed, and a very neat rear axle arrangement. The differential housing is of one piece, with a removable cover, and is so designed that the entire differential and bevel driving gears may be removed by simply taking off the cover. The rear axle is of the floating type, the rear wheels being mounted on ball bearings on the axle tube and the driving axle transmitting the power from the differential to the outer ends of the wheel hubs by means of jaw clutches. All the driving mechanism may be taken out of the axle without even jacking up the car or removing the wheels. The axle is trussed and of comparatively heavy construction. The usual radius or strut rods are provided, and the torsion rod, spring supported at its front end, takes up the driving torque and braking effect. No brake is mounted on the propeller shaft or other part of the transmission system, but both internal and external brakes are applied to the rear wheels, the contracting brakes being operated by a pedal and the expanding brakes by a hand lever. Air space between the two sets of brake drums is provided to facilitate the radiation of friction heat. The gasolene tank, as heretofore, is mounted back of the rear axle, the fuel being forced to the carburetter under pressure. As this model is intended for city use, the wheels are of smaller diameter than on the other models, the tire sizes being 870 by 90 mm. for the front

SIX CYLINDER MOTOR

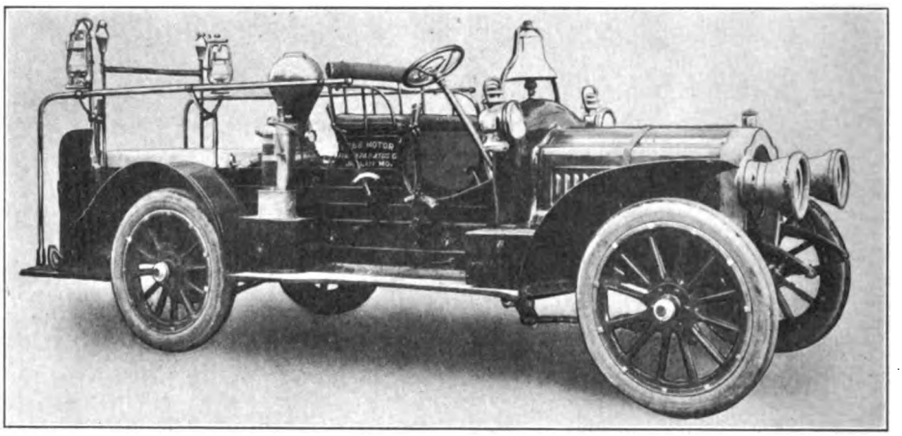
SIX CYLINDER AMERICAN LOCOMOTIVE

Digitized by Google

wheels and 880 by 120 mm. for the rear. In either the limousine of landaulet style, the price of the light car is $6,000. All of the models will be made of imported materials as in the past, vanadium steel and iron playing a large part in their construction, and when delivered to customers will have a very complete equipment, including tops.

Convenient Means of Adjusting Brakes.

Although considerable attention is now being given to the matter of brake design, the resulting improvement in the area of contact surfaces and strength of parts, is not all that is required. Next in importance to capacity and strength, the method and nature of the adjusting means should be looked after, as well as the provision for compensation between the rear wheel brakes. It is important not simply that means of adjustment be provided, but that it be of such a nature as to be readily accessible in case of need. Probably the most striking example of the way in which this feature may be disposed of with an eye to the convenience of the operator as well as to the element of time-saving on the road, is seen in the case of the Westinghouse cars, on which the rear expanding brakes are adjusted by means of a pair of small hand wheels extending to the rear of the axle just inside the spring. The arrangement is so contrived that by turning them one way or the other the tension of either brake may be altered as required, or the resistance of the set brought up to normal to compensate for rapid wear when running over mountainous roads, the adjustment taking hardly a moment's time, and requiring no dismantling of parts.



Strut Rods on Front Axle.

Although the use of strut rods for strengthening the position of rear axle is practically universal, similar practice in the case of the front axle is seldom found, owing, in all probability, to the comparative freedom from racking strains which that member enjoys. Where light frame and spring construction is attempted, however, it becomes very desirable to increase the rigidity of the front axle in this way, and in one or two instances, noteably in the case of the 16 horsepower Ford cars, the method is used to advantage. One of the first instances of its use on a heavier car, however, is to be seen in a new 20 horsepower landaulette chassis which has recently been brought out abroad, in which added resistance is obtained by means of a couple of struts running from the steering yokes on the ends of the axle to the sides of the power plant casing, which is of the unit type, the point of attachment being about midway between the clutch and the forward universal joint of the propellor shaft. This tends to relieve some of the srtain upon the springs due to road shocks received by the wheels, as well as providing for a true radial motion.

WEBB MAKING FIRE ENGINES

Former Racing Man Locates in Missouri—Shows Them How to Build Modern Fire-Fighting Apparatus.

A. C. Webb, the former well known automobile racing man, has turned from the sporting side of the motor car to the extremely practical one of fire fighting, and as head of the recently incorporated Webb Motor Fire Apparatus Co., of Joplin, Mo., is demonstrating the virtues of a fire engine built on an automobile chassis and using the regular gasolene motor of the latter for operating the pumping mechanism.

WEBB'S AUTOMOBILE FIRE ENGINE

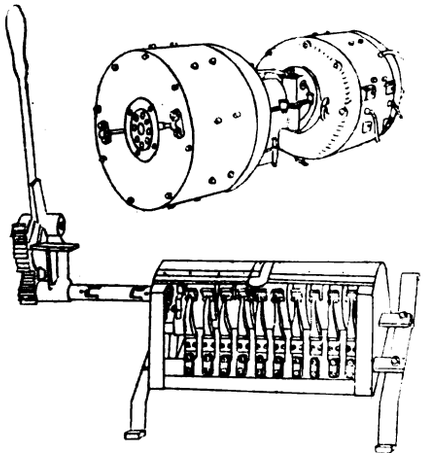
The fire engine, shown in the illustration, has a powerful rotary pump mounted on two cross frame members. A separate transmission system from the motor to the pump is provided, and this is controlled by a lever at the side of the driver's seat. The pump does not operate while the vehicle is on its way to and from a fire, but when the water is to be pumped, the gearing connecting the pump itself is thrown into mesh and action begins. Since the automobile fire engine may at times be called upon to stand for hours and pump at high speed, Webb has devised an ingenious method of keeping the motor cool despite the absence of the current of air through the radiator which the latter would get if it were traveling along the road. When the gearing is shifted to throw the pump into action the radiator is automatically cut off from the motor, and the latter is supplied with cool water for its jackets by a special feed from the rotary pump. Upon the pump gearing being thrown out of mesh, the radiator is automatically reconnected with the motor and is ready for the resumption of its duties.

Experiments at Buffalo have shown the automobile fire engine to great advantage. Members of the Buffalo fire department were recently given a demonstration at the plant of the E. R. Thomas Motor Co., and the outfit threw a stream of water completely over a three-story building. The fire engine, while mounted on a Thomas Flyer chassis, as are all of Webb's apparatus, was equipped with a smaller pump than the size now employed, so that even greater performance is possible with the models now being turned out.

Features in a Foreign Innovation.

Second to its motor, the most remarkable feature of the 20 horsepower Valveless car, a British innovation just announced, is the frame and rear axle construction, which, to say the least, is unique. The use of pressed sheet steel which forms the frame, has been carried to the axle housing, the floating drive idea being utilized, but in somewhat modified form. Four members of channel shape are riveted together in the form of a trapezoid, having its longest diagonal in line with the axle and its shortest vertical and intersecting the differential casing. The driving axle shafts are unusually large, and are exposed for a considerable portion of their length. The differential casing itself, is extended forward with a rectangular section, and forms at once a torsion member and housing for the driving chains of which there are two, one corresponding to each of the two forward speeds. The motor is the Lucas two-cycle, which comprises two vertical cylinders, joined by a common combustion chamber, and therefore having coacting pistons. It is placed in the center of the chassis and drives direct to the axle through one or the other of the two chains which afford different ratios of speed reduction.

Position of the Carburetter.



A question which has never yet been fairly settled is that of the proper position for the carburetter. One of the new foreign cars this year has its carburetter placed above the tops of the cylinders. Another has for several years carried it on a level with the inlet valves. Most designers, however, place it well down, in order to get a good flow from the tank.

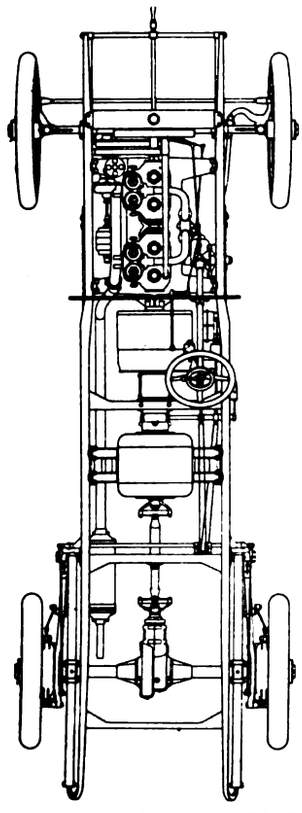
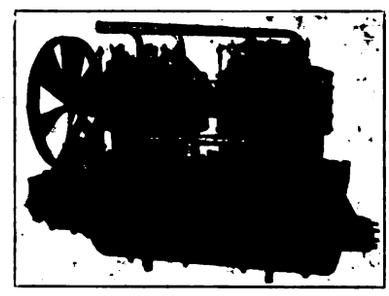
CONCERNING 1908 COLUMBIAS

Combined Electric-Gasolene Car to be Strongly Featured—Noteworthy Improvements Made.

Mark 66-3, which will be the topliner of the 1908 offering in the Columbia gasolene line, is a machine of generally standard outward specifications, driven by a four-cylinder motor of 48 horsepower, A. L. A. M., rating, and equipped with the direct connected electric transmission, which was brought out last year in a previous model sold under the same characteristic. The new Mark 66, however, differs from its



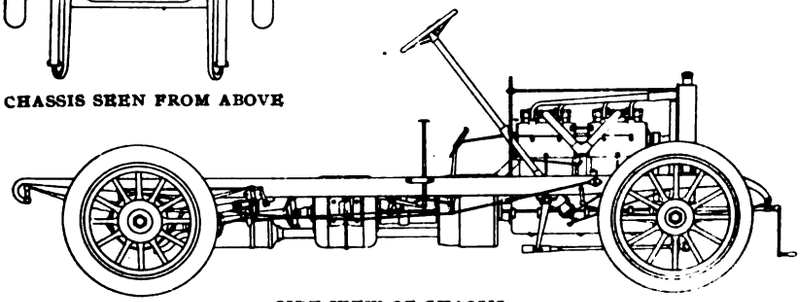
ELECTRIC TRANSMISSION AND CONTROLLER



forerunner in many respects affecting both the motor and chassis. The transmission remains practically unchanged. The second and only other gasolene car to be built by the Electric Vehicle Co., at its great Hartford (Conn.) plant during the coming year, will be the light four-cylinder car of 28 horsepower, which corresponds to a similar model of last year, but has an increased engine power, and a number of structural improvements worthy of note.

In general appearance Mark 66-3 is a large seven-passenger touring car of what might be termed the rationalized conventional type, having long wheel base, roomy body extending well over the rear axle, plow-share mud guards in front, luggage rack in the rear, and drawn up in rigid conformity to the principles of the "straight line" school of design. Its aspect in no way suggests any unusual mechanism, and, in fact, except for its size, its only distinguishment from Mark 48-2, the smaller car, lies in the absence of gear shifting and emergency brake levers, which are replaced by the single controller handle and one other controlling member which stands vertically at the side of the car in place of the ordinary brake lever.

The motor, which is entirely new, and which mounts enough "features" in itself to make it worth considerable study, has cylinders 5½ by 5½ inches, bore and stroke, cast in pairs with jackets integral and of liberal and inclusive proportions. Contrary to the practice of last year, both sets of valves are placed in pockets on the left side of the machine, the exhausts being worked from below and the inlets from above, by means of vertical pushrods and short walking beams. A novel feature of the arrangement is the provision for lubricating the valve stems on the inlet side, to prevent binding. The spark plugs are located between the valves and are liberally cooled by the jackets. Only the multiple jet carburetter occupies the right side of the motor. This is of the same type as was used on all Columbia cars last year, with the slight modification of a needle float valve used in place of a ball valve. Upon the left



CHASSIS SEEN FROM ABOVE

LEFT SIDE OF MOTOR

tor. Lubrication is by pressure feed from a sight feed tank mounted on the dash, the internal engine bearings also receiving a liberal oil bath from the crank pit, which is assisted by the action of scoops fastened to the ends of the connecting rods. The drainage from the engine bearings also being returned to the crank case, tends to keep that supply constantly up to its normal requirement. The cam surfaces constantly are covered with a film of oil, the effect upon the rollers carried by the followers being that of a cushion which absorbs a portion of the shock of impact and reduces vibration very materially.

The transmission, about which interest in the car centralizes, consists essentially of two independent and corelated organs, namely the motor and generator, the latter performing normally the function of a magnetic clutch. Attached directly to the engine crank shaft, and taking the place of the ordinary fly wheel is an annulus containing the windings of the generator fields. The armature is mounted within, on a secondary shaft, normally connected directly through to the propeller shaft, the driving bevels, and so to the live rear axle forming what is in every sense of the word, a direct drive. At the same time there is no mechanical connection between engine and

SIDE VIEW OF CHASSIS

are the timing and governor gears, the half-time shaft, centrifugal circulating pump and magneto.

Ignition is by high tension magneto, with single coil and auxiliary, to distributor and timer. The construction of the latter is such that neither primary nor secondary wires move when the time of sparking is advanced or retarded. A high tension Gianoli magneto also is provided, making thus two systems of ignition using but a single set of plugs, and a common distribu-

transmission, the air gap between the fields and armature of the generator serving to permit absolute freedom of motion between them except as they are restrained by the torque developed by the magnetic attraction.

In this relation, the motion of the fields creates a drag in the armature, which depends upon a very slight amount of relative motion between them, and is proportional to the amount of power developed by the engine. A fixed amount of "slip" between

Digitized by Google

driving and driven elements is thus developed, which is required for the generation of the energizing current. Under these circumstances, the speed of the car bears a definite relation to that of the motor, but in the event of the motor being slowed down, the variation in relative speed between the two elements serves to release them, in case their speed is equalized, or to act as an automatic brake in an extreme case, where the car overruns the motor, the action being reversed and the car tending to drive the engine, as is the case with the ordinary type of clutch.

For obtaining the speed reductions and power multiplications corresponding to the relations obtained with the lower gears in the ordinary type of transmission, the current from the generator-clutch is directed through the windings of the motor. At such times the "slip" between the driving and driven elements is increased, the energy which with the ordinary clutch would be absorbed in the heat of friction, in this case being converted into electric current, and used in energizing the motor and aiding in the propulsive effort. A variety of combinations are obtainable in this way by the use of a controller similar to that used in the ordinary electric vehicle, and a wide range of speed changes thus obtainable, the generator is released from the main shaft of the car and is clutched in a fixed position. The generator thus assumes the work of an ordinary dynamo, and the current it produces is utilized in driving the motor in either direction, according to the disposition of the controller lever.

Among the special features which have been applied in the chassis construction designed for this machine, may be mentioned briefly the rear axle driving group, in which all adjustments may be made from outside the case, the use of a special type of propeller shaft having a double spline provision in the slip joint, a novel form of radius rod, and a heavily trussed frame.

As to the smaller car, the engine has been enlarged, the cylinders now measuring 4¼ by 4½ inches, bore and stroke. The water jacket areas have been increased, while the firing holes of the make and break ignitors have been reduced in size, and to obvious advantage.

The half-time gears are now fully encased and run in oil, and the water piping has been rearranged. As for the transmission, the change gear shafts now run in annular bearings, the clutch diameter has been increased, the wheels have been enlarged to 34 inches, front and rear, while the mechanism of control has been improved by the adoption of a larger steering wheel than has been used heretofore.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

MISPLACED LOADS ON THE CAR

Bad Effect of Added Stress on Steps, Guards and Wings—Errors of Users that Reflect on Makers.

From the fact that such parts of the car as the steps, the guards and wings which serve to protect the sides of the vehicle from the side slung mud from the wheels, as well as the protecting strips between the running boards and the chassis, are not called upon to carry any load except that of their own weight when the car is in service, or at the most a very light load, such as tool and battery boxes, many designers fall into the error of making their supports far too light. As a result of this they are prone to excessive vibration, and frequently tend to work loose after a short period of use, developing a disagreeable rattle and ultimately requiring repairs or replacement far sooner than should be the case.

The point which seems difficult for the average user to grasp in this connection is that the static load which a part may carry when the car is at rest has absolutely no relation to the stress which may be thrown upon it when the car is in motion, and further, that where there is the slightest leeway for vibration or oscillation under such circumstances, the racking strains developed are greatly multiplied by the frequency and variety of the minor movements to which the vehicle is subjected. The lack of appreciation of this fact in the case of the user, is shown by the way in which spare parts are disposed about the car without regard to their effect upon the running stresses which they are likely to set up in the parts to which they are attached. The same lack of appreciation is shown by many designers in the use of mud guard and running board supports which are altogether too light, either to support their own weight with proper stability, or to carry the extra load which is apt to be put upon them by the heedless user.

On this account such parts, and more especially the running boards, should be supported with sufficient stability to carry far more than their nominal loads, not simply as a safeguard against absolute breakage under sudden shock to the vehicle, but also with an eye to checking that vibration which is almost certain to produce a disagreeable noise sooner or later More than that, such receptacles as the battery and tool boxes should be secured in such a fashion that they cannot break away from their fastenings under any circumstances, and so that in the event of their being overloaded, the resulting strains will not be likely to disturb the supporting member. The designer cannot be blamed if a failure occurs through misuse of the machine in any way. But the fact remains that such failure invariably redounds more or less to his discredit. It is not a question of cost or excessive weight, but of sound judgment.

Setback for Advocates of Alcohol.

Advices from Washington concerning results of the official tests being conducted by the government at the Jamestown Exposition as to the relative cost and efficiency of gasolene and alcohol say that the results are a disappointment to the alcohol enthusiasts.

For six weeks a Federal experimental station at the Exposition has been making comparative tests of the two fuels, the work being in charge of R. M. Strong and under the general supervision of Joseph A. Holmes, chief of the technologic branch of the United States geological survey, and H. H. Wilson, chief engineer. The general results of the tests so far, roughly indicated, show that it takes about a gallon and a half of alcohol to do the work of a gallon of gasolene. Inasmuch as denatured alcohol costs about twice as much as gasolene at the present time, the newer fuel is at a decided disadvantage.

The denatured alcohol advocates maintain that improved methods of using it are both possible and probable, and that the price is bound to drop as its use grows and the farmers begin distilling in large quantities from farm refuse. Although it is at present quoted at 30 cents per gallon, the opinion is expressed that its future price will be in the neighborhood of 10 or 12 cents, and that in spite of the unfavorable showing in the government tests on the basis of cost, there is a great future before it. The tests will be extended to other fuels.

American Ideas Catch on Abroad.

After several years of scoffing at the friction transmission, among other so-called Americanisms in the way of automobile design, England is now in a fair way to have a friction driven car, the transmission of which in many respects is a close counterpart of one which has been in use in this country for several years. Air cooling has almost ceased to be taken as a joke in Great Britain by this time, and one of the newest of the season's new cars, is equipped with a two-cycle motor. The trade as a class, however, still affects to look with some disdain upon American construction and methods of design.

Thomas to Quit Track Racing.

E. R. Thomas, the Buffalo manufacturer, has announced that after this season his company will have no more to do with racing on horse tracks. He gives as his opinion that such courses are unsafe and unsuitable. Before retiring, however, Mr. Thomas expresses a wish to have his car engage in one more 24-hour race, with particular reference to the two foreign cars that won the long grinds at Morris Park this fall. He has named H. S. Houpt, his New York agent, to act for him in arranging such a contest.

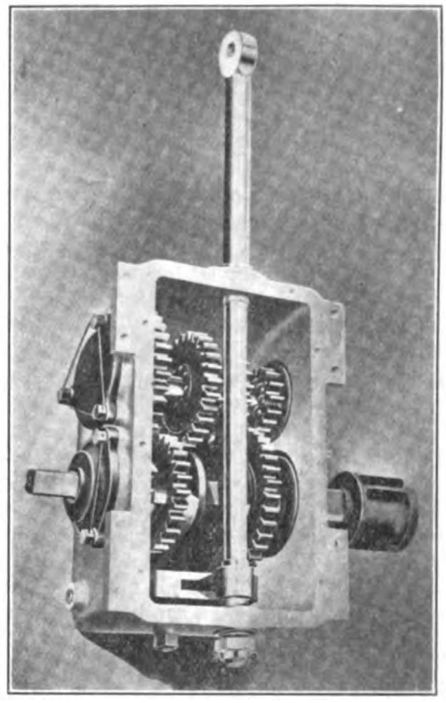
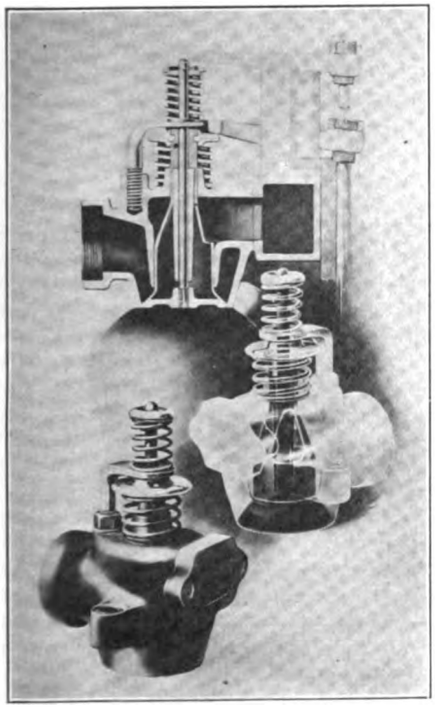
FEATURES OF THE FRANKLIN

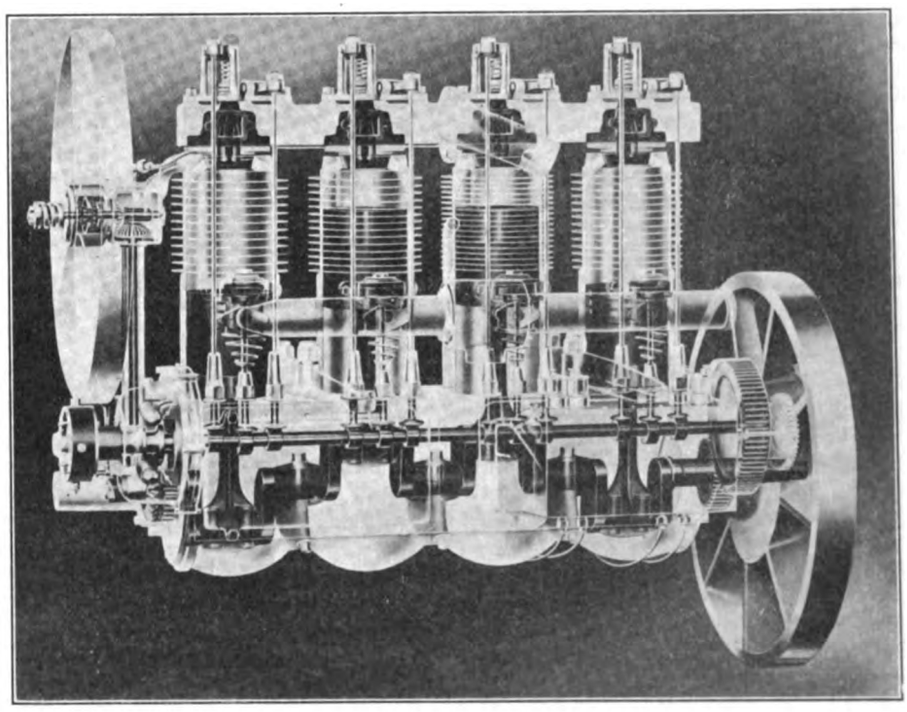


Concentric Valves Constitute Radical Innovation—Other Parts in Which Air Cooled Cars Are Bettered.

A number of alterations in the construction of the engine, amounting practically to a redesign of that important organ, thus permitting the development of new horsepower ratings for all types; the use of an entirely new type of selectively operated change speed gearing on the two larger models; as well as a number of less important improvements, serve to create entirely new standards for the 1908 Franklin line. As heretofore, the Syracuse (N. Y.) plant of the H. H. Franklin Manufacturing Co., will be devoted to the construction of three main types of chassis, two having four-cylinder motors, and one a six, to which various sorts of bodies will be applied according to the numerous uses to which they are applicable.



The most remarkable feature of the new engine construction is the use of a type of concentric valve which is entirely novel, and which besides generally simplifying the mechanical construction of the cylinder units, permits the adoption of the hemispherical formation for the combustion chamber, carrying with it sundry thermal advantages, held to be very great. The inlet valve, seating directly in the cylinder head in a cage of special construction, instead of taking the familiar mushroom form, consists of a hollow sleeve having a conical or funnel shaped head, and fitting closely a guide above, which separates the inlet and exhaust ports in the cage. It also carries a second guide which directs the stem of the exhaust valve, the latter being a rider in the inlet and opening communication from



FRANKLIN TOURING CAR

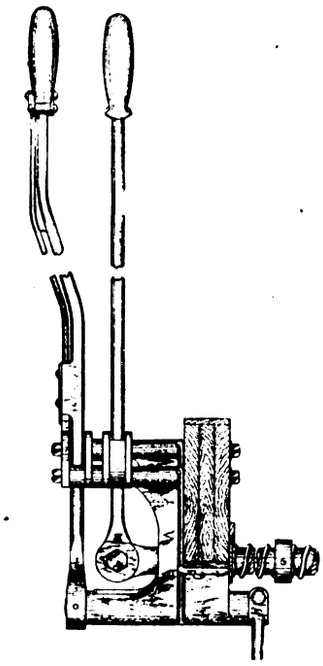
FRANKLIN CHANGE SPEED GEAR

FRANKLIN CONCENTRIC VALVES

FRANKLIN MOTOR

Digitized by Google

the cylinder to the exhaust main through the hollow interior of the inlet. Both valves are actuated independently of one another, from above, and in the usual way, the two members acting in unison to secure the inlet relation, and the inner member alone being operated to secure the exhaust. In using this method of distribution, considerable advantage is secured by the use of the auxiliary exhaust ports in the cylinder walls at the end of the piston travel, through which some three-fourths of the charge is delivered before the release of the main valve.



The use of an oil baffle plate at the base of each cylinder for the purpose of controlling the splash lubrication—an innovation last year, is continued. The phosphor-bronze radiating flanges are shrunk in place on the cylinders, a special feature, also continued from last year, being the use of different numbers of flanges on different cylinders, thus proportioning the radiating surface to the amount of air circulation which it is destined to receive, as measured by its distance from the front and rear fans. Of the latter, the forward member is gear driven from the crank shaft, and rigidly mounted in front. The second is made integral with the fly wheel, and exercises simply a suction effect in assisting the work of the other. The two-to-one gearing is placed at the rear of the motor, and is completely enclosed. and protected.

The new features in the carburetter comprise the use of a novel type of jet, which has a number of forked branches and a multiplicity of orifices, thus tending to encourage the intermingling of the ingredients of the mixture; a rearrangement of the float and mixing chambers, the latter now partaking of the nature of the Venturi tube, and a new method of supplying warm air to the carburetter. This comprises a heat collector, surrounding the exhaust box, and a feed pipe leading to the carburetter.

Another new departure is found also in the construction of the timer which is of entirely new design, and is "non-wearable" as well as non-adjustable. Contact is made between a hardened steel roller and segments of the same metal, the latter being insulated by means of air gaps instead of fibre as is more commonly employed for the purpose. Another improvement in the ignition systems applied to the two larger models this year, is found in the use of the Bosch high tension magneto. The smaller model still uses batteries as the source of its ignition current.

The multiple disc clutch arrangement is the same as that used on this year's cars. The change speed gear used on the larger cars, in addition to being extremely neat and compact, possesses a rather unusual feature in the shifting arrangement. For this, the usual gridiron segment has been dispensed with, the shifting lever instead, riding on a simple segment about which it is pivoted in order to secure the selective motion of the single gear striking rod. A couple of springs surrounding the latter member, serve to keep it normally in the central or neutral position, from which it is displaced by the operator in order to make the gear selections. This arrangement, together with the neat design of the emergency brake lever, makes a particularly simple and effective lever group at the side of the machine.

The three models produced this year will be of 16, 28, and 42 horsepower, respectively, corresponding to the 1907 ratings for the corresponding machines of 12, 20, and 30 horsepower, respectively. The increased powers are attributable to the general improvement in the construction of the machine, to which also the lighter weights of the motors made possible by the new design should add in net output. Mainly, however, the increase is secured by the new valve construction, which in addition to its theoretical advantages, has proved to be of great practical benefit.

FRANKLIN CONTROL LEVER

Witherbee Produces New Spark Plug.

Having for some seasons supplied motorists with the "juice" end of their ignition outfits, in the way of accumulators, the Witherbee Igniter Co., New York, now is supplying plugs for the cylinder end of the ignition circuit. The new plugs take their name from the initials of their manufacturer and are called "Wico" plugs. The most novel feature of their construction is the incorporation of a micrometer attachment, from the readings of which the motorist may separate the points to any predetermined distance with an exactitude which is calculated to insure good results. The readings run as fine as a thousandth of an inch. Thus the gap may be adjusted to any condition of compression or current. The insulating porcelains are easily removed in their brass carriers, for cleaning, and are as easily put back without altering the adjustment. The sparking end is formed to act as a clearing syphon.

Position of the Fuel Tank.

One of the strongest arguments advanced against the rather popular method of feeding the carburetter from a low tank by means of pressure taken from the engine exhaust, is based upon the assertion that the gases tend to mingle with the fuel thus carrying over into the mixture a certain proportion of unburnable gas which, however low, yet acts as an undesirable and inert diluent. It is well known that all liquids are subject to a certain amount of aeration, and the fact that the fuel in the low-hung tank is constantly being agitated when the car is in motion, coupled with sundry otherwise inexplicable shortcomings of the system, lends color to the idea. On this basis, the more complicated method of using pure compressed air, has very obvious advantages.

It is a well known fact that with the ordinary type of gravity flow fuel tank mounted under the seat and feeding the carburetter through a low head, steeply pitched hills have a marked effect on the behavior of the motor, owing to variations in the fuel pressure in the float chamber. In all probability, however, the average owner fails to consider that as fast as the fuel is used from the tank the head is proportionately lowered, so that not alone is the effect of grades affected by low fuel in the tank, but also in some measure, the performance of the machine on the level. The absolutely constant pressure supply system is yet to be developed.

Just a Question of Etiquette.

Motoring etiquette has been accustomed to demand that the chauffeur shall stand either directly in front of his car or immediately at one side of the bonnet while waiting for the owner. It is perfectly evident that this custom is as antidiluvian and seedy as the hitching post at the present time, however. For every up-to-the-minute and particular motorist drives a car which has a self-starting motor. Putting the chauffeur out in front indicates that the motor must be cranked before starting Hence even those owners whose motors still require the preliminary wind-up before setting about their business, should assume that attitude of gentle prevarication, known as a bluff, and let the driver remain seated at all times or at least, until it becomes necessary to give away the secret.

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

MILLIONS OF MILES OF ROADS

Progress in Work of Improvement—Where Advance Has Been Made—Indiana Has Most Good Highways.

While it is known in a general way that some parts of the country have made greater progress than others in the improvement of the public roads, and that enormous sums are expended annually on road construction and repairs, there has been no information compiled up to the present time showing just what has been accomplished and how much is expended annually for this purpose in the United States, says a Washington correspondent. A few of the States have published reports giving some information upon these subjects, but only in rare cases have they shown the mileage of improved roads or the road expenditures by local authorities.

The office of public roads in the Agricultural Department has just completed the collection, compilation and publication of information from every county of the United States in regard to the mileage of improved and unimproved country roads in the year 1904, and the expenditures on roads and bridges from property and poll taxes, bond issues, and State funds under the State-aid laws, and the amount of value of the labor expended under the statute-labor laws.

In 1904 there were 2,151,570 miles of public road in the United States. Of this mileage, 108,232.9 miles were surfaced and gravel; 38,621.7 miles were stone, and 6,809.7 miles were special materials, such as shells, sand-clay, oil, and brick, making in all 153,664.3 miles of improved road. From this it follows that 7.14 per cent. of all the roads in this country have been improved.

By comparing the total road mileage with the area of all the States and Territories it appears that there was 0.73 of a mile of road per square mile of territory. A comparison of road mileage with population shows that there was one mile of road to every thirty-five inhabitants, and one mile of improved road to every 492 inhabitants.

The majority of all the roads in this country were originally laid out along the boundary lines of farms, with little regard for drainage, topography, and alignment. In the Eastern States the boundary lines of farms were very irregular, and consequently many of the roads are crooked and badly located with reference to grades. In the Middle West, where the land was laid out by the Government, the roads follow the section lines, and in thickly settled communities, the quarter-section lines. In compiling these figures, the aim has been to include only the mileage of roads actually open and in use.

Only four States have more than 100,000 miles of roads. Texas stands first, with 121,409 miles; Missouri second, with 108,133; Iowa third, with 102,448; and Kansas fourth, with 101,196. The District of Columbia has only 191 miles of road, Rhode Island has 2,361 miles, which is the smallest mileage of any State. Delaware has only 3,000, and Arizona only 5,987 miles.

By comparing the road mileage with the areas in square miles, the District of Columbia is found to stand first, with 3.18 miles of road per square mile of area, while Connecticut is highest among the States with 2.90 miles. Rhode Island has 2.24 miles, Pennsylvania 2.21 miles per square mile of area. Arizona has only 0.05 of a mile, the smallest mileage per square mile; Utah has 0.08 and Wyoming 0.10 of a mile per square mile.

Assuming the average width of the rights of way of country roads in the United States to be 40 feet, the area of such rights of way in 1904 amounted to 10,431,727 acres. Estimating the value of this land on a basis of the valuation of farm lands in each State, the approximate value of the rights of way of all the public roads would be $341,899,306. A much higher valuation would be amply justified by the fact that in sections where the mileage of roads is greatest the land is considerably above the average in value.

It was generally believed at the time when railroad building was first undertaken in this country that the railroad would supplant the wagon road, and this line of reasoning accounts in a large measure for the neglect of the common roads from about 1835 until about 1890. The necessity for the improvement of the common roads is impressing itself upon the people more now than at any time in the history of the country. The mileage of public roads is greater now than it has ever been, and the extension of railroad and trolley lines has induced such an amazing development of the country's resources as to bring about a remarkable increase in traffic over the common roads. The heads of the great railroad systems are now seriously directing their efforts toward securing the improvement of the common roads, which they recognize as feeders to their railroad lines. For every mile of railroad we have about ten miles of wagon roads.

Of the 153,662 miles of improved roads in the United States, Indiana has the largest mileage—that is, 23,877 miles. Ohio occupies the second place, with 23,460 miles. Wisconsin is third, with 10,633 miles; Kentucky fourth, with 9,486 miles; California fifth, with 8,803 miles. Illinois, Massachusetts and Michigan have over 7,000 miles each; Minnesota over 6,000 miles; New York over 5,000 miles; Tennessee over 4,000 miles; Connecticut, Maine, Missouri, New Jersey, Oregon, Pennsylvania, and Texas, over 2,000 miles each; and Alabama, Georgia, Iowa, Maryland, New Hampshire, North Carolina, Rhode Island, South Carolina, Vermont, Virginia, and Washington, over 1,000 miles each of improved roads.

In about two-thirds of the States, gravel has been the principal surfacing material used in improving the roads. The largest mileage of gravel roads was found in Indiana, Ohio, Wisconsin, Massachusetts, Michigan, Minnesota, Illinois, and California. In eight States the mileage of macadam roads exceeds that of gravel, and in a few others it is nearly equal. Kentucky has the largest mileage of road surfaced with stone—over 8,000 miles—and Ohio is second with a little over 7,000.

By comparing the percentage of roads improved with the population per mile of road, it will be noticed that in most cases the States which have the highest percentage of improved roads have the largest population per mile of road, and vice versa. While it cannot be claimed for improved roads that they invariably lead to an increase in population, good roads are certainly a powerful factor in encouraging immigration, especially in sparsely settled regions.

The percentage of improved roads in any community or State depends upon a variety of causes, the most important of which which may be summed up as follows: (1) Availability of suitable road-building material; (2) wealth of the State in agriculture, manufactures, transportation, etc.; (3) requirements of traffic. Prosperity promotes a desire for the advantages and benefits to be derived from the improvement of the roads; but whether a community is rich in agriculture or otherwise, If it had to depend on materials imported from distant places, progress in the improvement of the roads will be much slower than if local materials are abundant.

There are several other reasons why the percentage of improved roads is higher in some of the States than in others. The high percentage of improved roads in Massachusetts, Rhode Island, Connecticut, and New Jersey is due principally to the facts that suitable road-building materials abound, that these States are densely populated, and that many of the roads have been built through the aid of the States and under the direction of competent State authorities. Indiana and Ohio have an unusually high percentage of improved roads, because the social and economic conditions were favorable to the making of public improvements.

A comparison of the percentage of roads improved with the acreage values of farm lands in the United States, shows that the average percentage of the improved roads in all States where the land is worth less than $20 per acre is 1.9 per cent., whereas in the States showing an acreage value of more than $20, improved roads constitute an average of 9 per cent, of the total mileage. Expressed inversely, the States showing a high percentage of improved roads have on the average relatively high acreage values, while those showing a low percentage have low acreage values.

SKILLFUL FUNMAKING AT NEWTON

Gymkhana Meet Attracts a Large Attendance—Clever Work in Series of Amusing Stunts.

While jobless policemen looked on and grinned, automobiles raced around a quarter mile track backwards, smashed barrels to smithereens and performed many other novel stunts for the edification for a large crowd at Newton, Mass., last Saturday, 12th inst., the occasion of the second annual gymkhana games of the Bay State Automobile Association. The severa levents were contested on the old Newton athletic grounds.

The first event was a rather mild contest but it was one in which the policemen took a lot of interest. The contestants drove once around the track at the nearest to a 12-miles an hour pace they could judge, and to have made this pace exactly would have required 90 seconds. Harry W. Knights, Pierce Arrow, won in a walk in 90⅗ seconds, which is certainly a feat in accurate pace judgment.

How quickly a driver can bring his car to a stop when going 15 miles an hour was demonstrated. A pistol shot marked the instant to apply brakes and at the same time a small bag of flour was dropped from the car to mark the exact spot. J. L. Snow brought up his Peerless in 18 feet 4½ inches, winning by a jerk.

Walter Schmunk was the best cigar lighter and pufffed around the track in 58⅗ seconds. He also finished first in the obstacle race, in which the cars had to tag each barrel in two rows without knocking it over. The backward race was awarded to Schmunk, as was the "man-killing" race, in which the barrels were all knocked down in the least possible time. He drove a White. Ralph Coburn guided his Maxwell through two rows of barrels without touching one and so got a cup for his expertness.

The summaries:

Speed judgment contest, at 12 miles an hour (90 seconds required time)—Won by Harry W. Knights, Pierce Arrow; second, A. A. Knights, Oldsmobile; third, F. A. Hinchcliffe, Winton. Time, 0:90⅗.

Stopping contest, at speed of 15 miles—Won by J. L. Snow, Peerless; second, Ralph Coburn, Maxwell; third, R. R. Ross, Peerless. Distance, 18 feet 4½ inhces.

Cigar lighting contest—Won by Walter Schmunk, White; second, F. A. Hinchliffe, Winton; third, R. R. Ross, Peerless. Time, 0:58⅗.

Barrel touching contest—Won by Walter Schmunk, White; second, S. H. Baker, Stevens-Duryea; third, Ralph Coburn, Maxwell. Time, 2:13⅕.

One-quarter mile backward race—Won by Walter Schmunk, White; second, R. R. Ross, Peerless; third, J. L. Snow, Peerless. Time, 0:44⅗.

Expert driving contest—By Ralph Coburn, Maxwell; second, A. A. Knights, Oldsmobile; third, Walter Schmunk, White. Time, 0:17.

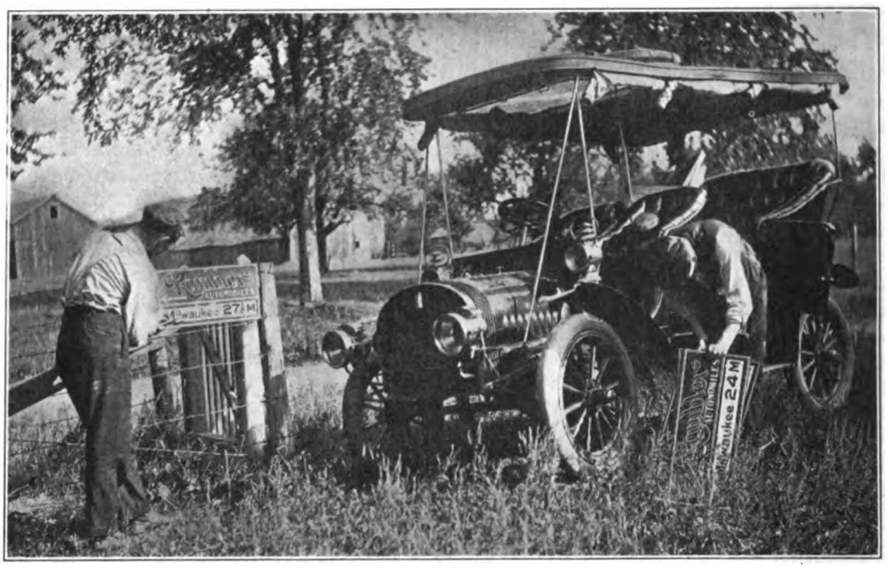
"Man killing" race—Won by Walter Schmunk, White; second, R. R. Ross, Peerless; third, J. L. Snow, Peerless. Time, 1:40⅗.

Club Aids Street Improvement.

Macadam will displace the mud of Euclid avenue, from the village of Euclid, Ohio, to the county line, through the efforts of the Cleveland Automobile Club. The club has provided $20,000 and the village of Euclid an additional $15,000, the club in addition guaranteeing to make good any deficit up to $5,000. The contract for the work of macadamizing the road has been given to Asa Goddard, secretary of the Cleveland A. C.

London's Modern Fire Apparatus.

Motor-driven fire fighting apparatus is rapidly gaining favor abroad. In addition to placing several machines in London, the famous house of Merryweather & Sons has recently sent a new gasolene driven engine to Glasgow, a steamer to Singapore, and a gasolene driven ladder and hose tender to Bombay. Steam engines have been ordered by the fire brigades of Londonnerry and Widnes, Ireland, as well.



Minneapolis Suffering from Theft.

Minneapolis is contesting against a wave of automobile theft, despite the watchfulness of the special detective recently placed on duty by the local automobile club, to guard against this sort of thing. One night last week five machines were stolen, and all were found the following morning unharmed, except one, which had a punctured tire.

MARKING ROADS FOR TOURISTS

Jeffery Setting up Guideboards on Many Highways—Systematic Plan of Mark- in the Route Plain.

Although it is not generally known, Thomas B. Jeffery & Co., Kenosha, Wis., have undertaken a sign-posting campaign that now has reached proportions that command attention. The work has progressed so rapidly during the past month that 2,500 have already been put up in the touring districts of the Middle West. Another 2,500 are now awaiting shipment to Rambler agents for immediate placing. The

MAKING THE WAY OF THE TOURIST PLAIN

signs are of sheet steel, and, as shown by the accompanying illustration, are sufficiently sharp and clear to be seen from a great distance. The roads between Milwaukee and Chicago have already been well provided with them, while all the roads to the southern Wisconsin lake resorts, such as Lake Geneva, are thoroughly marked. The Oconomowoc lake region, which has many intertwining roads which are puzzling to the average driver, will be made clear to the motorists through the efforts of the Rambler Garage Co. of Milwaukee, who will superintend the erection of the signs in this district. The signs are usually placed on fences, but when solid supports are not available they are placed on special posts provided for such emergencies. The next few months will see the extension of these signs to roads in all parts of the United States.

Automobile Postage Stamp Arrives.

The automobile postage stamp has at last made its appearance. Bosnia and Herzegovina, has recently adopted a new stamp on which a motor driven mail van appears in bold relief.

SCHLIPP'S THIRD RACE UNLUCKY

He Had Captured Two at the Chicago Meet —Lost Big Event Through the Breaking of a Tire.

Besides making the fastest time of the day at the much postponed meet of the Chicago Automobile Club at the Harlem track, last Saturday, 12th inst., Charles W. Van Sickle, of Hammond, Ind., gained the distinction of riding a motorcycle in the fastest mile ever made on an unbanked track. Van Sickle covered the distance in 56 seconds, but as intermediate miles are not recognized, and this was made during the course of a ten miles race, his wonderful performance will not be chronicled in the book of records. The meet was successful despite cool weather and two postponements, about 2,000 persons watching the races from the grandstands.

One accident, which resulted fortunately for the drivers involved, occurred to the big Stearns car in the half-hour race, the feature of the meet. C. P. Schlipp had created the sensation of the meet, by driving rings around the other contestants in the events to which he was eligible and was looked upon as a likely winner in the half-hour grind. He took the lead at the start of the race, but had gone only a mile before a tire gave way, and a portion of it flew up and mixed with the steering gear, causing the driver to lose control of the machine. It ploughed the fence and tore a tree from its roots, bringing up in a dense growth of brush. R. C. Chevalier, the mechanic, was thrown from the seat and fell on his chest, breaking his collar bone. Schilpp was uninjured and was calmly lighting his pipe when the track attendants reached the scene. The race was won by George Farnsworth, Cadillac, who covered 23¼ miles in the 30 minutes of riding. David Buck, Apperson, was a close second with 23 1-16 miles.

The three mile open for cars listing at $1,500 and under was won by R. L. Bartol, Ford, who beat Frank X. Mudd in another Ford, by a narrow margin. Farnsworth captured the five miles for cars under $3,000. The five miles restricted to Chicago A. C. members who are owners not connected with the trade, went to W. G. Lloyd, Stoddard-Dayton, with Frank Mudd, Ford, as the runner-up.

Prior to his accident Schilpp had captured two fast events—the pursuit race, in which he "tagged" David Buck, Apperson, after four miles were covered in 3:58, and the ten miles free-for-all, in which he covered the distance in 10:22.

Van Sickle was the star of the two-wheeled brigade who furnished plenty of excitement in three close races. In the ten mile open to machines not exceeding 30.65 cubic inchs cylinder displacement, Van Sickle won out over a large field in 12:46; he also won the three miles open for motorcycles of the same cylinder capacity in 3:33⅗. His fast mile was made on a twin Indian in the ten mile handicap, when he passed the seventh and remaining man in the last mile, which was made in 56 seconds flat, the fastest time ever made by a motorcycle on an unbanked mile track. Fred Huyck, Harley-Davidson, was the runner-up in the two open events, and E. L. Hess, R-S, secured the place in the handicap.

The summaries:

Ten mile open for motorcycles—Won by Charles W. Van Sickle, Indian; second, Fred Huyck, Harley-Davidson; third, G. Blankenheim, Torpedo; fourth, J. F. Alofsin, Racycle. Time, 12:46.

Three miles for cars listing at $1,500 or under—Won by R. L. Martol, Ford; second, Frank Mudd, Ford; third, E. W. Willett, Buick. Time, 4:40.

Five miles for runabouts listing at $3,000 or under—Won by George Farnsworth, Cadillac; second , E. W. Willett, Buick; third, E. W. Disher, Ford. Time, 6:36.

Three mile open for motorcycles—Won by C. W. Van Sickle, Indian; second, Fred Huyck, Indian; third, H. Bernard, Harley-Davidson; fourth, J. F. Alofsin, Racycle. Time, 3:33⅗.

Five miles for C. A. C. owners, not connected with the trade—Won by W. G. Lloyd, Stoddard-Dayton; second, Frank X. Mudd, Ford; third, C. E. Gregory, Thomas. Times, 11:57⅗, 12:05, 12:05⅕.

Unlimited pursuit for stock cars—Won by C. E. Schlipp, Stearns; second, David Buck, Apperson; third, E. W. Disher, Ford. Distance, 4 miles. Time, 3:58.

Ten miles free-for-all, handicap for motorcycles—Won by C. W. Van Sickle, Indian; second, E. L. Hess, R-S; third, Harvey Bernard, Harley-Davidson; fourth, J. F. Alofsin, Racycle. Time, 11:09.

Ten miles free-for-all—Won by Charles Schilpp, Stearns; second, David Buck, Apperson; third, George Farnsworth, Cadillac. Time, 10.22.

Half-hour invitation—Won by George Farnsworth, Cadillac; second, David Buck, Apperson. Distance, 23¼ miles.

One mile exhibition—By David Buck, Apperson. Time, 1:05⅕.

Plans Gasolene Supply Station.

Cleveland drivers will not have to walk a mile or more for gasolene if the tanks go dry, if the proposition of Frank B. Many is accepted by the Board of Elections of that city. Many proposes to use the voting booths for gasolene stations, fitting a dozen or more with permanent gasolene tanks supplied with nickel in the slot arrangements, whereby one may purchase any amount of gasolene by dropping a coin in the slot. He offers to rent the booths at a consideration that would pay for them in three years; it is said that the proposition is being carefully considered.

NASHVILLE SEES GOOD RACING

Christie's Nephew Proves Himself a Speed Merchant—Jack Prince Gets into Automobile Sport.

Lewis Christie Strang, a nephew and understudy of Walter Christie, broke into the automobile game as a driver of real racing cars at the meet at historic Cumberland Park mile track, Nashville, Tenn., last Friday, 12th inst. He made an auspicious debut, driving an exhibition mile in 54 seconds, within one second of the world's record. Simultaneously, John Shillington Prince, the dean of bicycle race meet promoters, made his entrance into automobile racing circles, for he it was who arranged the meet. "Jack" Prince has not conducted a bicycle meet for some time, but has been making money fast in Nashville with a skating rink, and it has been a mystery to his acquantances how he so long has kept his hands out of automobile sport.

The meet also emphasized the fact that Barney Oldfield, who is invincible for the reason that he has not allowed himself to meet any one in a match except by his own arrangement, is afraid of Walter Christie. Since W. H. Pickens, Oldfield's former manager, took hold of Christie, to recuperate his own fortune and also Christie's, he has been trying to "make Oldfield look like thirty cents," to quote Pickens himself. He almost accomplished it at Pittsburg, when unbeknown to Oldfield he took Christie to Brunots Island track and planned to have his "star" ride rings around Oldfield. Only the unfortunate accident to Christie prevented the carrying out of his plans. Oldfield got very much ruffled, so ruffled, indeed, that he sought Pickens in the Fort Pitt hotel and a fistic encounter ensued, which was broken up when bystanders parted the belligerents.

Ever since, Pickens has been gunning for Oldfield and when he learned he was to compete at Nashville he made arrangements for Christie to appear there also. When he heard of it, Oldfield cancelled his contract and failed to appear. Christie had not fully recovered from his Pittsburg injuries so he entrusted his car to Strang for a mile trial. Although the track is not the best in the country the young understudy covered the distance in 54 seconds. This led Christie to publicly challenge Oldfield, stating that he will wager $1,000 that Oldfield cannot duplicate Strang's performance, and $5,000 that Oldfield cannot beat either Strang or himself in a five mile race. Christie offers to give Oldfield a quarter mile start, but no one has made it clear where the $5,000 is coming from.

The five mile touring car open was well contested by local drivers. Green driving a Wayne and Yowell in a Pope-Hartford, raced neck and neck for four miles, and the

Digitized by Google

former won out by less than a length on the tape. A handicap match between a Ford and an Oldsmobile was won by the latter. The summaries:

One mile exhibition—By Lewis C. Strang, Christie. Time, 0:54.

Three miles against time—By L. C. Strang. Time by miles, 0:57, 0:55, 0:54.

Five miles open, for touring cars—First heat, two miles, won by Joseph Yowell, Pope Hareford; second, Edward Sweeny, Stevens-Duyrea. Time, 2:55. Second heat won by Newman Hill, Pope-Hartford; second, Joseph Roller, Rambler. Third heat won by John Green, Oldsmobile; second, J. C. Sims, Ford. Time, 3:00. Final heat won by John Green, Wayne substitute; second, Joseph Yowell, Pope-Hartford; third, Newman Hill, Pope-Hartford. Time, 8:53.

Five mile match handicap—Won by John Green, Oldsmobile (scratch); second, Cleveland Sims, Ford (⅛mile). Time not stated.

Fix in a Series of Bad Fixes.

Albert Fix is in a fix himself through his ability to fix motor cars and for not fixing one as securely as he should have. Fix, who lives in Detroit, was employed by a Mrs. Wilson, of Lexington, Mich., as a chauffeur. He got $50 a month and expenses during the summer and when, a few days ago, his season's work was finished, he persuaded Mrs. Wilson that her machine was worth very little after a whole summer's use and bought it from her for the small sum of $125.

After talking the matter over with friends, Mrs. Wilson decided that she had sold altogether too cheaply, so she decided to get the car back again. Fix, who had not left Lexington, was locked up in his room at the local hotel by an officer, under the direction of Mrs. Wilson, who took this means to prevent his escape. Finding himself a prisoner, he kicked down the door during the night and escaped. When he learned that Mrs. Wilson wanted to have him arrested, he surrendered himself to a justice of the peace, but the latter refused to hold him on the showing made by the complainant. Fix then put the automobile aboard the steamer Flora and started for Detroit. During a storm, the boat gave such a lurch as to send the car plunging out of the gangway into the bottom of Lake Huron, where neither Fix nor Mrs. Wilson will ever be able to find it. Blue with the results of the trip, Fix had further troubles when he got to Detroit, being arrested there when he stepped off the boat, on telegraphic advice from Lexington, where Mrs. Wilson had obtained a warrant against him.

By telling his hard luck story in full, Fix was able to fix it with the Detroit police so that he could have his liberty on the promise to appear at the police station when the officer from Lexington should arrive. It still remains for him to fix up matters with Mrs. Wilson, who has threatened to "fix" him.

OLDFIELD AMAZES TERRE HAUTE!

The "Star" and His "Satellite" Perform to the Delight of Hoosiers—Savin Wins One Event as Usual.

Before a crowd of 4,000 people at Terre Haute, Ind., Sunday of last week, 6th inst., Barney Oldfield broke a record. His "sensational" performance was not a world's record, however; Oldfield merely drove a mile in 59⅘ seconds, which was some faster than the Terrehautians had ever witnessed a mile covered before. But that was not all of Ooldfield's feats at Terre Haute that day. Far from it, for did he not defeat the "daredevil Italian," Ollie "Savini," in as close a race as was ever witnessed on circircular track? He did. And was not Terre Haute mightily tickled and did it not sound the praises of the mighty Oldfield? Again, "it did." Whereat the peerless Oldfield did wax exceedingly pleased and did say unto himself: "This is a jay good town, I will return yet again, for this is the land of easy shekels and Mumm's my word."

It must have been great when Oldfield covered a mile in the unheard of time in Terre Haute of 59⅘ seconds. According to the local papers a "large crowd of spectators turned out to see the most wonderful feats ever performed in auto circles—the professionals greeted with round upon round of applause—Barney swung around the track at lightning speed, scarcely pausing in his mad flight around the curves of Death—onlookers watched him with amazement—loudly cheered for his nerve-racking feat. It was most marvellous!"

And then to cap the climax Oldfield defeated Savin in the "most thrillingest" race imaginable. He let him lead until almost the finish then rushed by in one mad dash at the tape, winning out in a gasp. Barney "retained his title of world's champion only after a hard fight." It was wonderful. Even Savin, the "daredevil Italian," drive an exhibition at a mile-a-minute clip. No wonder Terre Haute just sat up in the grandstand and hugged itself in a paroxym of unalloyed joy.

Of course, there were other great races, but they paled into insignificance beside the marvelous feats of Oldfield and his selfnamed "dare-devil Italian." The following summary will suffice to show the results:

Three miles for motorcycles—Won by C. W. Twigg, Yale; second, George Arrowsmith, Curtiss; third, T. R. Casebeer, Yale.

Three miles for Ford runabouts—Won by Virgil Pounds; second, Claude A. Floyd; third, C. Hayes. Time, 4:48⅗.

Two miles against time—By Ollie Savin. Time by miles, 1:03⅘, 2:06⅗.

Two miles against time—By Barney Oldfield. Time, 1:01⅗, 2:01.

Three miles, free-for-all, handicap—Won by Ollie Savin (scratch); second, C. Hayes, Ford; third, Ed. Weiant, Buick; fourth, W. B. Fox, Pope-Toledo.

Two mile championship match between Barney Oldfield and Ollie Savin—Won by Oldfield. Time, 2:23⅗.

Ten mile open—Won by Pounds, Ford; second, Weiant, Buick; third, Hayes, Ford.

Brooklands Track Made Safer.

A remedy, almost primitive in its simplicity, has at length been developed for the protection of drivers using the runover to the finishing stretch at the Brooklands Motordrome in England, making safer that portion of the course upon which, during races, so many accidents have occurred. This consists of nothing more nor less than a broad black line painted on the cement of the track and termed the limit line. It leads in a long sweeping curve around from the stretch to the main course and terminates at the entrance to the paddock. Drivers finishing a race are obliged to keep within its boundaries upon penalty of disqualification, and must not stop their cars until they have crossed a second intersecting boundary called the stopping line. This leaves a strip of the main course always clear in case other cars are still running at the end of a race, besides requiring drivers to have their cars under full control after crossing the finishing line. All drivers must subscribe to the new rules before entering a race. It is hoped in this way to put an end to a long series of mishaps at this point, several of which have been serious in their nature, and one fatal.

Pittsburgers Organize a 6-ty Club.

A press agent in Pittsburg has bestirred himself and formed the Six Cylinder Club, adherents of this type car only being eligible. It is stated that if a member speeds faster than 6-ty miles an hour he has to pay a fine in the form of a banquet to his fellow members, each plate to cost $6 a plate. It is not added what the judge's fine will be if a member is caught for speeding at 60 miles an hour. Naturally the membership will be limited to 6-ty.

Club Organized for Hudson Valley.

The Hudson Valley Automobile Club was organized at a meeting held in oughkeepsie, N. Y., one night last week. The club starts with a membership of fifty, and these officers: President, Dr. J. W. Poucher; first vice-president, Ralph Tompkins; second vice-president, Albert A. Simpson; third vice-president, John Hopkins; secretary, Otis W. Sherman; treasurer, Clinton D. Parkhill.

Sacramento Valley Has New Club.

Thirty-eight motorists have formed the Sacramento Valley Automobile Club, which will have its headquarters in the California city of that name. Officers will be elected at a future meeting.

PLANS A BENEVOLENT INVASION

Tyler Promises to Make Nantucket Prosper—Peaceably, if He Can; Forcibly, if He Must.

The new ordinance passed by the selectmen of Nantucket closing "particular roads and ways" in that town to the automobile, and thus practically excluding the vehicle from the entire island, threatens several varieties of trouble. At present it is before the State Highway Commission, for the approval of that body. There will be considered in relation to it a protest against approval, which has been signed by a number of permanent residents who side with the automobilists against the anti-automobile element on the island. Already the commission has discountenanced the exclusion policy of the selectmen and the new ordinance appears likely to meet an adverse fate.

Should the ordinance get by the commission, however, Frank J. Tyler, of Boston, is ready to follow up the signal victory he won against the town through the recent decision of Judge Edgar Gray Sherman in the Superior Court. How Mr. Tyler regards the situation, and what he purposes to do is best told in the text of the following letter sent by him to the governing board of the town:

"To the Selectmen of Nantucket:

"On Thursday, October 1, Judge Sherman of the Massachusetts Superior Court rendered a decision upholding my contention that your automobile exclusion order could have no standing in the courts of this commonwealth. To any one older than seven, it must be apparent that Nantucket, being a part of this commonwealth, has no more legal right to deprive a citizen of his rights than has any other section of the State; and that her highways cannot be closed to any legal method of travel.

"Having this in mind, I am greatly amused at the attitude of your board, as reflected in the order which appears in the Inquirer and Mirror of October 5, and which reads as follows: 'Automobiles are hereby excluded from these particular roads and ways in the town of Nantucket, viz.: Broad street, North and South Water streets, Federal street, Center street, Union street, Orange street, Main street and the Milestone road. Selectmen of Nantucket, John M. Winslow, Secretary.'

"Now, any one familiar with the situation knows that this order is in effect an absolute exclusion of automobiles from the island. Your ban covers every avenue of travel from the steamboat wharf, every possible avenue of approach to the State highways, and even the State highway between Nantucket and Siasconset as well.

"Your contention is, judging from this and your former order, that you have the right to dictate the kind of vehicle that shall be used for conveyance over Massachusetts roads. If I happen to land at Nantucket and desire to proceed to Siasconset, you say to me, 'You must engage one of Selectman Pitman's livery teams, or one from some other of the numerous liverymen of the island, all of whom seem to be brothers, cousins, uncles, sons, fathers, or some other close relative of one or more of the selectmen—at an expense of $3 if I take the right hand road, and $3.50 if I take the left.'

"Notwithstanding there are some 200 or more livery horses on the island, apparently all owned by the selectmen, their brothers, fathers, sons, etc., I was not able to find one late in August that the society for the prevention of cruelty to animals would allow driven about the streets of Boston. They were subjects for the fertilizer mills—tired out, worn out—and I consider it a crime to drive them.

"I was told that with one of these overworked animals, by a liberal use of the goad, I might negotiate the distance from Nantucket to Siasconset—about eight miles of as beautiful state highway as one would care to ride over—in an hour and 20 minutes; that I would find a livery stable at the Siasconset end owned by Selectman C. H. Pitman, where I could have the poor overworked beast baited for $1, and then I might allow at least one hour and 15 minutes to drive back. I can see no justification for the cruelty to animals this drive would impose, or for the outlay of $3.50 by one road or $3 by the other. A much more humanitarian means of making the trip would be to jump into my Maxwell touring car and in 20 minutes (with no pangs of remorse for cruelly prodding over the road the poor overworked scarecrow of a horse) at an expense of about 16 cents I am at my destination in Siasconset.

"There are hundreds of people who spend their summers in Siasconset who want this method of transportation, and there are miles of as beautiful seashore as God ever created as barren of houses as the north pole of sunflowers, a large portion of which you would see covered with beautiful summer homes if you would but hold out the glad hand.

"The Maxwell automobile will prove the greatest godsend Nantucket ever had. I intend to give Siasconset people a quick, comfortable and economical method of reaching their homes from the steamboat landing in Nantucket, and if you will join me, we shall make your bleak, unpeopled shores blossom as the rose.

"Selectman Pitman and all other livery men instead of being driven out of the livery business and forced to quarters in 'our island home,' will find profitable use for a much larger number of livery horses than they now employ for short pleasure drives to places of interest, in all parts of the island.

"If you don't care to join my band wagon of prosperity, of course you are privileged to stay off. I want you, however. Come on!

"Just one more word in closing. Your automobile exclusion order has no more legal effect than the prattle of a nursing babe. I shall in a short time drive my Maxwell car over the public highways from Nantucket to Siasconset, and I will prosecute to the fullest extent of the laws of this commonwealth any one who interferes with my rights.

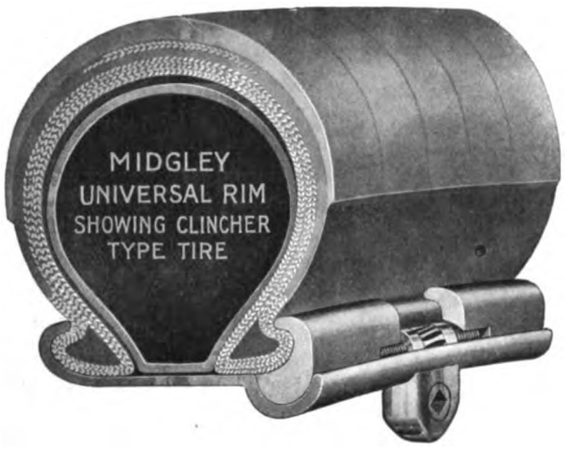
(Signed) "Frank J. Tyler..

"Boston, Oct. 9, 1907."

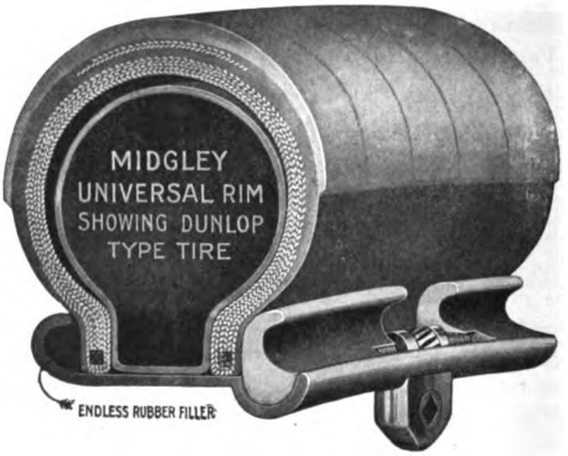
"Marine" Insurance for Automobiles.

Why "marine" insurance companies should be authorized to insure such vehicles as automobiles under the Massachusetts laws was a question that appeared as a conundrum to the legislative committee which is holding recess sessions to consider questions connected with insurance. Charles E. Barnes, representing several such companies, appeared before that committee in Boston on October 10, and asked for the insertion in the insurance laws of a provision enabling them to insure automobiles against loss by damage through collision and similar causes.

It appears that, under a recent ruling of the state's attorney general, marine companies were permitted to insure automobiles against fire and the request made was with the aim of having the other class of damage underwritten in the same policy. The members of the committee seemed to be unaware of the existing privilege under the attorney general's ruling and a number of questions were fired at Mr. Barnes to elicit information as to why "marine" companies were permitted to insure vehicles which have no connection whatever with the perils of the sea. Mr. Barnes explained that the word "marine" had become obsolete in its literal insurance sense, and that "transportation insurance" would be a more accurate description.



Centenarians Given a "Joy" Ride.



Four thousand years took an automobile ride around New York last Sunday. Several philanthropists thought that old people who have outlived their usefulness should be entitled to an outing as much as orphaned children, so they got several cars and gave seventy residents of the Home of the Daughters of Jacob what to practically all of them, was their first automobile ride. The combined ages of the occupants of one of the large cars amounted to more than 4,000 years. The unusual sight caused pedestrians to stop and cheer or wave greetings at the old folks, which were enthusiastically returned in kind.

"The A B C of Electricity."

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

The Week's Patents.

863,151. Automatic Spark-Advancer. Benn P. Churchill, Milwaukee, Wis., assignor of two-thirds to Retta Pierce Davenport and Everett C. Rockwell, Chicago, Ill. Filed July 28, 1906. Serial No. 328,188.

1. In a gas engine, the combination of a rotating member, a switch connected with the sparking mechanism of the engine, a governor weight movable with reference to the rotating member, a link connected to said governor, extending along one side of the center of the rotating member, a contact mounted on the link adapted to engage the switch, means for so guiding said link that as the governor weight moves it moves said contact on the link about the center of the rotating member for the purposes set forth.

863,206. Resilient Wheel for Motor Cars and Other Road Vehicles. Tom Oldfield and Joseph A. Schofield, Halifax, England. Filed July 27, 1906. Serial No. 328,068.

1. In a wheel, the combination, with an outer rim, and an inner or hub portion; of sleeves pivoted to the said inner portion, normally radial bars having their middle portions slidable in the said sleeves and their outer ends pivotally connected with the said rim, abutments secured on the end portions of the said bars, and helical springs arranged between the ends of the said sleeves and the said abutments.

863,266. Speed Indicator. Isaac P. Davis, Springfield, Mass. Filed Nov. 2, 1906. Serial No. 341,765.

1. In a speed indicator, the combination of a rotary non-reciprocating governor shaft, a ball governor consisting in part of a rotary sliding member on said shaft, a rotary member at one side of said governor shaft having a peripheral spiral, a pointer in operative connection with said spiral member, and connecting means between the rotary sliding member of the governor and the spiral member whereby the spiral member is caused to revolve by reason of the rising and falling movement imparted to said sliding member on the governor shaft.

863,317. Transmission Gear. Julius H. Richards, Torrington, Conn. Filed March 21, 1907. Serial No. 363,704.

1. In an automobile transmission mechanism, the combination with a fly wheel of a plurality of sets of planetary gears of different diameters held to the fly wheel, a transmission shaft rotatably held in the fly wheel, a plurality of gears held to rotate with the transmission shaft as an axis and meshing with the planetary gears, means for locking certain of the gears to the transmission shaft, together with means for imparting a rotary movement to the sets of gears on their own axis as they move with the fly wheel.

863,337. Fluid Cooler. Allie R. Welch and Fred S. Welch, Pontiac, Mich. Filed June 5, 1905. Serial No. 263,724.

1. In a cooler consisting of a plurality of tubes for the passage of a cooling medium and having circulating passages therebetween and an inclosing frame, a hollow casting forming a part of said frame having its hollow communicating with said passages, a pump chamber forming part of said said casting and having a passage communicating with said hollow through which passage the pump is adapted to cause a fluid to flow.

863,341. Transmission Mechanism. Erhard T. Alber, Ann Arbor, Mich. Filed Dec. 20, 1906. Serial No. 348,695.

1. In a frictional transmission mechanism, the combination of the driving and driven shafts in parallel relation, a friction cone upon each of said shafts, said cones being so disposed that the base of one cone stands opposite the apex of the other cone, an eccentrically journaled shaft adjacent to said cones and so positioned as to lie parallel with the opposed faces thereof, the axis of said shaft being inclined with respect to the axes of said parallel shafts, a friction roller mounted upon said shaft to rotate thereon and to slide longitudinally, means for sliding said roller longitudinally of said shaft, and means for rocking the shaft to carry said roller toward and from said cones.

863,342. Muffler. Erhard T. Alber, Ann Arbor, Mich. Filed Dec. 20, 1906. Serial No. 348,697.

1. In a muffler, the combination of the non-perforated casing, a central cylinder therein disposed to form an annular space between it and the wall of the casing, the wall of the cylinder at its forward end being provided with perforations which communicate with said annular space, a movable piston within the cylinder, an induct pipe communicating with the forward end of said cylinder, and an educt pipe communicating with said annular space through the rear end of said casing.

863,348. Construction of Automobile Vehicles. Marcus Birkigt, Barcelona, Spain. Filed June 23, 1905. Serial No. 266,647.

1. In an automobile vehicle the combination of a frame, comprising flanged metal side members, a motor crank casing and a gear box, portions integral with the flanges of said side members extended to and bolted to said crank casing and gear box respectively, and brackets extending to and carried directly by said side members and supporting the weight of said casing and gear box irrespective of the said portions of the side members, substantially as described.

863,353. Tire Tool. William C. Broadwell, Rochester, N. Y. Filed Nov. 21, 1906. Serial No. 344,391.

1. In a device of the character described; an arm adapted to be inserted between the tire and the rim of the wheel and to react on the rim and a support adapted to hold such arm at an operative angle with the plane of the wheel with one end engaging between the rim and the tire and the other extending in a dirction oblique to the axis of the wheel and effectually in a plane radial thereto.

863,369. Sparking Device for Explosive Engines. Joseph S. Elverson, Catasauqua, Pa. Filed Feb. 6, 1907. Serial No. 355,978.

1. In a sparking device, an engine having an explosion chamber therein, electrodes having terminals extending into said chamber, non-conducting means having an opening interposed between said terminals and means for actuating said non-conducting means so as to permit the opening thereof to be brought opposite the terminals of said electrodes, said non-conducting means adapted to normally prevent passage of sparks between the same until the openings have been brought opposite said terminals.

863,388. Lamp. William S. Hamm, Lakeside, Ill., assignor to The Adams & Westlake Company, a Corporation of Illinois. Filed May 12, 1905. Serial No. 260,191.

1. In a lamp of the kind described, in combination, a chambered body provided with an upper annular air chamber, such annular chamber having annularly arranged induction ports and being in communication with the body chamber; and annularly arranged radially disposed perforate partitions in the air chamber.

863,451. Vehicle Wheel. Thomas Rowland, Coraopolis, Pa. Filed April 9, 1906. Serial No. 310,620.

1. In a wheel, the combination with a hub, and a tire, of a plurality of elliptical springs supported between said hubs and said tire, and having their major axes radiating from said hub, each spring consisting of a strip of metal wrapped a number of times upon itself, washers interposed between said wrappings, substantially as described.

$800 "THE LAMBERT 18" $800

THE BEST VALUE IN AMERICA AT THE PRICE

Ask the best posted mechanic of your acquaintance what he thinks of the Friction Drive, and the answer will be: "The Best on Earth." Ask a farmer and he will not know, because his calling has not required that he keep abreast with the improvements in power transmission—especially as applied to automobiles.

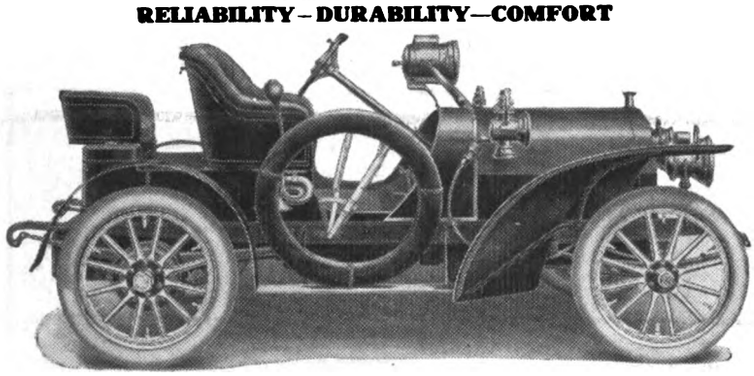
Better still, see the Lambert, have a demonstration—examine the mass of testimony that has come to use unsolicited—we fell sure that the verdict will be: "I will buy a Lambert because it is the simplest, nobbiest and best car on the market for the money." Write for catalogue.

See the Lambert in Section "D" main floor, Grand Central Palace, New York City, Oct. 24-31.

THE BUCKEYE MANUFACTURING COMPANY, *A Few Good Agents Wanted* **ANDERSON, INDIANA**

WITHOUT A DOUBT

Other things being equal, you certainly prefer a car, which



Starts Without Cranking

The Triumph

SELF-STARTING CAR

is the outgrowth of years of experience, and embodies in its construction the three cardinal virtues

RELIABILITY—DURABILITY—COMFORT

It is the only car equipped with a Self-Starting Motor, and is so simple that any lady may drive it without the attendance of a chauffeur. There is nothing to watch, nothing to get out of order. You simply

"Push the lever and the motor starts"

THE TRIUMPH Car is built in two styles: **Model A—30 H. P., 4 Cylinder Runabout, - $2000.00** **Model C—30 H. P., 4-Cylinder Touring Car, $3000.00**

Triumph Motor Car Co., Dept. G, Chicago, Ill.

In a Blinding Rain Storm

through six inches of mud for thirteen consecutive hours during the recent 24 hour race at Philadelphia a Lozier car won, equipped with the

Battery Witherbee

The batteries occupied an exposed position in the rear of the chassis and from two to ten pounds of mud were scraped from them every time the car came off the track for water and gasolene. These same batteries ran the car to New York.

If you want the best Ignition System—specify Witherbee Batteries for your 1908 Car.

Write department 20 for catalogue.

When the Glidden Tour Ended

It was found that

3 Out of Every 4 Tourists
had used
Warner Auto-Meters

Yes, sir; of the 48 cars that finished at New York in this year's Glidden Tour, exactly 36 carried **Warner Auto-Meters.** Just think of that! **Three times** as many **Auto-Meters** were used by these **experienced motorists** as there were of **all other** speed-and-distance indicators **combined!**

This **sweeping victory** for Warner Auto-Meters, followed **last** year's **equally** creditable performance in the Glidden Tour, and the recent notable triumphs in the **Chicago Sealed Bonnet Contest** and the **Boston Endurance Race,** establish beyond the possibility of a doubt that the Warner Auto-Meter is the **only** speed-and-distance indicator that can be **depended** upon to do the work right at all times and under all conditions.

Accurate as a Watch—Reliable as a Compass

Warner Auto-Meters are made on the **proven-successful** magnetic principle. They're just as **reliable** and **durable** as a **mariner's compass.** No matter how **rough** the road, you can tell **at a glance exactly how fast** you are going. The arrow **never** flutters or bobs back and forth. The Warner Auto-Meter is as **accurate** as a watch.

You ought to have an Auto-Meter on your machine—it **doubles** the pleasure of autoing, helps you to **control** your machine and **frequently** saves embarrassing situations in the **police court.**

You'll notice the handsome little Auto-Meter on **most** of the best cars. Take a **look** at it; inquire about it—nearly **all** automobile dealers sell **Auto-Meters.**

Write us the name and power of your car, and we'll tell you just what it will cost you to put an Auto-Meter on the dashboard.

THE WARNER INSTRUMENT CO., 767 **Roosevelt St., Beloit, Wis.**

¶ Why Solar Gas Generators Always Satisfy.

¶ Because they embody the only correct principle of gas generation (wick feed) making flooding impossible. ¶ Are made round so as to enable each part to be drawn from one piece of heavy sheet brass (not four pieces soldered together). ¶ This absolutely removes the possibility of leakage and produces a steady supply of never failing gas.

You Cannot Compare The New Oval Raised Tread Tire with Any Other Automobile Tire

It is as totally different as it is decidedly better.

"The Tire of the Day," G & J Raised Oval Tread gives greater satisfaction than any other tire for the simple reason that it is better made.

No other tire manufacturer ever made an Oval Raised Tread tire by the open-cure steam process—distinctively the G & J method.

No other process makes as good tires—and no other tires gives as much wearing surface—as much resiliency—as long life and complete satisfaction as do G & J Tires.

Try them and you'll say The G & J "The Tire of the Day" for me.

TRUFFAULT-HARTFORD SHOCK ABSORBER

Renders Real Rough Road Relief

The spring action of a car effects its smooth running qualities. Proper control of the springs prevent excessive oscillation, which insures LESS WEAR and TEAR, LONGER LIFE OF TIRES, GREATER SPEED AND GENUINE COMFORT.

This control of the springs can be secured only by the use of the TRUFFAULT-HARTFORD, the PIONEER Shock Absorber. The device that makes cobblestones and rough roads seem like asphalt.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

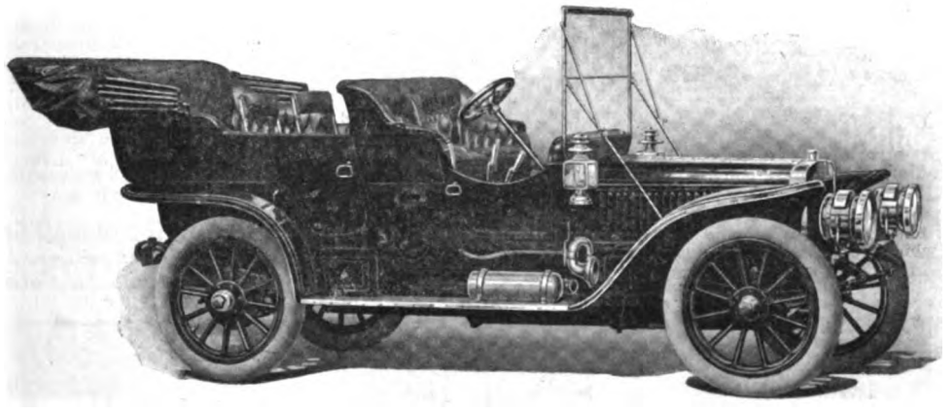
If you have the slightest doubt that the six-cylinder is the masterpiece of motor car making, take a critical ride in the new Winton Six-Teen-Six and you'll be enthusiastically converted.

Goes the route "like coasting down hill." Starts from the seat on compressed air. Rides luxuriously. Try the

WINTON

Six-Teen-Six and find the newest joy of motoring.



$2500 in Gold
For Ten Good Chaffeurs

First Award $1,000
Second Award $500
Third Award $250
Fourth Award $150
Six Others $100

A plan to benefit owners as well as drivers. Ask us about it.

Six quiet, powerful cylinders, producing power three times in every crank-shaft revolution, exerting constant tension on the driving mechanism—eliminating vibration, jar, shock, noise and the jerk and the wear of four-cylinder motors—using only minimum power for ordinary work and reserving tremendous power for bursts of speed and triumphant hill-climbing, minimizing expense of operation and upkeep, giving its owner a joy and pride heretofore unrealized—the most superb car possible to imagine—this is the Winton Six-Teen-Six.

The exclusive car of 1908—entire output limited to 500 cars. Purchase price includes five-bow top, five lamps, gas tank or generator, horn, tools and glass front.

When you pay $3000 to $5000 for an Automobile, Mr. Business Man, you get a pretty *good car*—but you don't get your *money's worth*

You don't because today most automobile *values* bear the same relation to automobile *prices* that *bicycle* values and prices bore to each other *twelve years* ago.

You paid $125.00 for a good wheel *then*. Today you can buy a *better* one for 60 per cent *less*.

Before you pay $3000.00 to $5000.00 for an *automobile*, find out what sort of a car the *Mitchell* is at *$2000*.

Don't take it for granted that $2000 *can't* buy as good automobile value.

Prove that it *can;* it isn't a bit of trouble. Put *higher* prices on the *defensive*. Do it this way—

Try the Mitchell—any agent anywhere will be *glad* to "show you" a combination of style, finish, construction and performance in the Mitchell new models, the superior of which hasn't been "shown" in any car made today regardless of price.

See the Mitchell at the show—scrutinize it most critically—leave your business card and address and state the most convenient time to call for you.

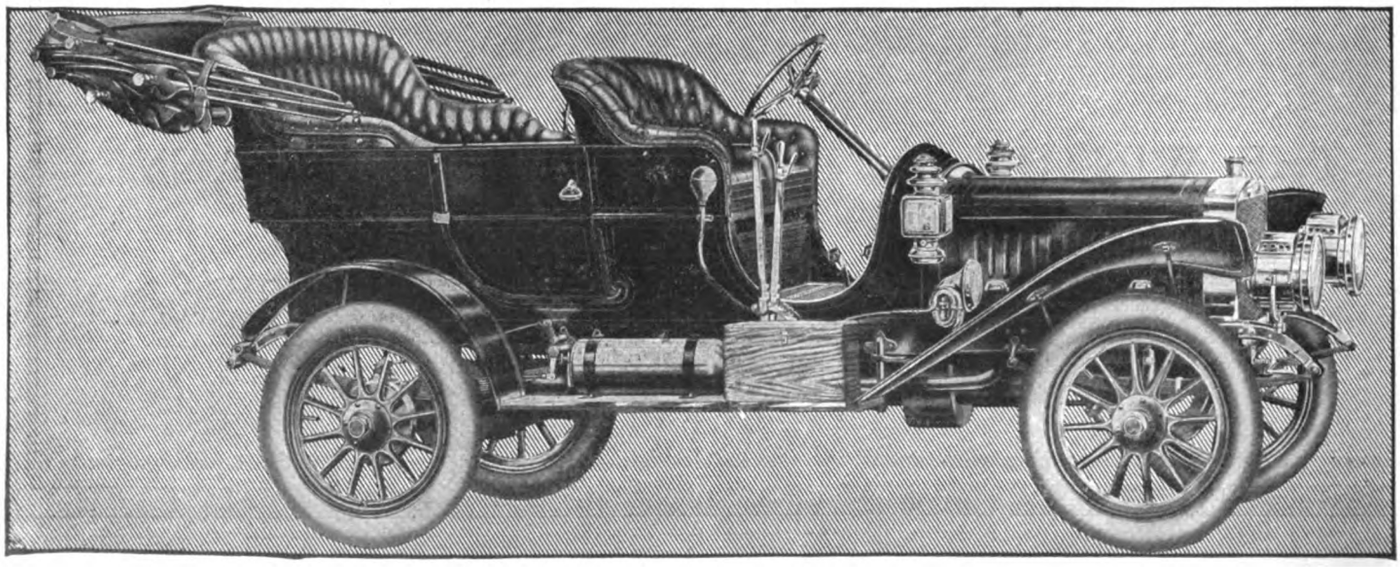
Then we'll send a car around and show you a *silent argument* that will instantly appeal to your business judgment and *convince* you—a silent argument the equal of which no *salesman* ever will be capable.

The Mitchell will *prove* value equal to that of any car. The Mitchell will *decide* the question of automobile prices and value once and for all time.

Isn't saving $1000 or $3000 on an automobile which *proves* itself right *worth considering*, Mr. Business Man?

If you saw a chance to save $3000 for your business, wouldn't you go to at least $500 worth of trouble to do it?

To save $3000 on your automobile, which is worth $3000 to you *personally*, is no trouble *at all* and doesn't cost *anything*.



You simply telephone any Mitchell agent that you are interested (no obligation on your part) and want a demonstration.

Think it over, Mr. Business Man. Do you know a single good, business-like reason *why* you should pay more than $2000 for an automobile? Prove that there *isn't* any by writing us or the nearest agent for names of many satisfied users of the Mitchell who have driven their cars thousands of miles over all kinds of roads and hills, and have encountered every known road test that makes or breaks a car. Let them tell you facts in their *every-day* experience which proves the Mitchell to be the most economical car to *keep* as *well* as to buy.

THE MARMON

"A Mechanical Masterpiece"

The Easiest Riding Car in the World

Do These Points Interest You?

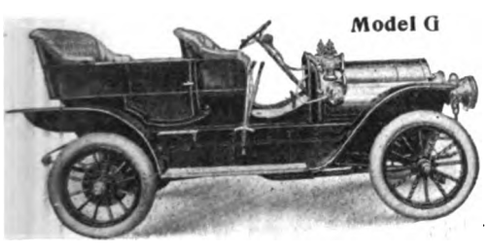
¶ Do you want the easiest riding car in the world without any exception; a car that will go over rough roads with comfort to the occupants and without straining the mechanism of the car? If so, look into the Marmon Double Three-Point Suspension.

¶ Do you want a car in which a woman can tour without fear of exhaustion and without injury to her health? The Marmon is the only car that fully satisfies this requirement.

¶ Do you want an unfailing oiling system that needs no watching, no adjusting? The Marmon has it.

¶ Do you want a clutch that defies wear and starts the car without a jerk? See the Marmon Multiple Disc Clutch with Cork Inserts.

¶ Do you want a strong, dependable steering gear so easy that it can be operated with one finger? Examine the Marmon Roller Bearing Steering Column.



¶ Do you want, all through your car, just such provisions for railroad reliability with mental, physical and financial comfort? Get acquainted with the Marmon Motors (air-cooled and water-cooled), Marmon Perfected Cast Aluminum Body, Marmon Selective Transmission, and other distinctive Marmon features.

¶ This mechanical superiority is your clear gain in buying a Marmon, for you will buy at the same time all the beauty of appearance, all the quality, and all the advantage of reputation to be found in any other car at any price.

¶ In short, do you want the most actual value for your money?

¶ A study of Marmon construction and a ride in the car itself will prove the above points and should precede the purchase of any automobile.

Brush 2-Cylinder Announcement

Price $750.00 Speed 50 Miles per hour

Tool Box and Rumble Seat $50.00 extra. Detachable Surrey Rear Seat $100.00 extra.

This 1908 addition to our line has been called a "Dream on Wheels," because of the wonderful smoothness and sweetness of its 2-cylinder vertical BALANCED motor, theoretically and practically the superior of a 4-cylinder.

The removable seat idea gives a 2-, 3- or 4-passenger car in five minutes time.

And the 1-Cylinder $500.00 Runabout—

the greatest seller of the times. Has exceeded all expectations.

The $600.00 PACKAGE CART is just out.

The $800.00 2-cylinder delivery wagon will appear soon.

IS THIS LINE WORTH HANDLING?

Foreign Industry Is Facing a Crisis

Fewer Purchasers of Automobiles In European Capitals Than Makers Had Prepared For.

SMALLER CARS WILL RESULT

Lighter and More Economical Machines Likely To Be the Solution of the Problem.

[SPECIAL CABLE TO THE HERALD.]
HERALD BUREAU,
No. 49 AVENUE DE L'OPERA,
PARIS, Monday.

Is there or not a crisis in the automobile industry? A stranger entering the automobile trade circles of any of the large European capitals at present might almost be forced to conclude in the affirmative.

On all hands in France, Italy and Germany there is talk behind the scenes that a stranger might very well come away with an alarmed view of the situation. Very few writers have cared to deal with the question, pressing though it is thought to be.

Newspapers have maintained stubborn silence, with what object it is difficult to tell. The ostrich policy has been adopted in most cases, confirming the suspicion that things are not going well.

Several serious reasons for the situation are advanced by those engaged in the business and the more important of these are overproduction and the cost of upkeep.

That there is a serious overproduction of large automobiles is proved by the fact that all the dealers and makers, with a few notable exceptions for which there are special reasons, find themselves embarrassed with large stocks of "chasses" either fitted with coach work or in an unfitted state.

The cost of the upkeep of powerful automobiles is perhaps just as responsible for the present stagnation as overproduction. Even the richest quail at bills, which the upkeep of a powerful automobile constantly in use inevitably brings.

People are learning slowly that speed costs money, especially speed with weight. This to some extent explains the present situation, and dismal predictions as to the future are hardly justified.

Out of the present crisis there will come a more perfect motor, a smaller automobile, economical, but still speedy and all that reasonable people can desire. There are plenty of indications that this will be the case.

Makers who are not totally blind to the fact that opinions are changing among purchasers are studying the economical machine of small power capable of doing all that ordinary people require.

Chemists are experimenting with fresh fuels; tire makers are looking for fresh materials or processes of fabrication.

The Herald's correspondent is right. There *is* a crisis in the automobile industry; both abroad and in the United States. The main cause is the unscientific and extravagant upkeep of the average powerful and heavy motor-car. And its day is past. The crisis is all to the advantage of the Franklin, the sensible and economical automobile. That is why we are 102 per cent. ahead of last year on actual, specified deliveries of the strong scientific high-power and light weight.

Rainier

"The Pullman of Motor Cars"

GUARANTEED FREE OF REPAIRS FOR ONE YEAR

OUR NEW PLANT, FROM WHICH IS COMING THE 1908 "MODEL D," TO ADD TO RAINIER FAME.

SOUND business economy demands that in selling a car under our original and distinctive guarantee, "Free of repairs for one year," that the chief expenditure must be at the beginning, that is, at the factory and, in material and construction, instead of in the local repair shops: Therefore our new factory at Saginaw, Mich.

The new plant comprises sixty acres of ground, with spacious brick buildings, in which every piece of machinery is new and specially designed for building the RAINIER. Nothing has been omitted that would tend to insure accuracy and superlative quality. James G. Heaslet, the original designer of RAINIER cars, is responsible for the 1908 RAINIER, which is higher-powered and more strikingly than ever a "Pullman" in quality and finish. "Quality, not quantity," is our factory watchword, and the 1908 output has been limited to 300 cars.

Rainier

"The Pullman of Motor Cars"

GUARANTEED FREE OF REPAIRS FOR ONE YEAR

1908 "Model D," 45-50 H. P.

SPECIFICATIONS

ENGINE—Rated H. P., 45-50; four cylinders, vertical, cast in pairs; 5-inch bore, by 5¼-inch stroke; cylinders hard gray iron castings, accurately ground to size; pistons light but rigid, ground to fit; valves on opposite sides, mechanically operated, all interchangeable; cams forged integral with shafts; crank shaft nickel steel forging, with bearing surface ground; main engine bearings and connecting rod bearings of finest babbitt metal, enclosed in bronze cases, a construction the same as that in the highest priced imported cars.

IGNITION—Make-and-break system, with Simms-Bosch, low tension magneto, but with a greatly improved and simplified mechanical sparking device, insuring accurate timing and minimum need for adjustment; one upright ignition shaft in place of four.

LUBRICATION—Positive feed mechanical oiler, driven by gear from the cam shaft, provides for engine bearings, magneto and pump shaft; Cylinders and pistons fed by splash system.

CARBURETER—Improved automatic type, having auxiliary air control on dash; feed by gravity flow through trap and screen; Capacity of gasoline tank, 20 gallons, two in reserve.

COOLING SYSTEM—Extra large radiator with fan running mounted on a pedestal over the timing gear case; fan belt runs vertically, driven by a pulley directly on the crank shaft.

CLUTCH—Multiple disc, alternate bronze and steel plates, running in oil; very sensitive touch.

TRANSMISSION—Selective type of gears, four speeds forward and one reverse, direct drive on third speed; shafts and gears nickel steel, and shafts mounted on imported ball bearings; counter shaft located below driving shaft, enabling use of sealed bearings, thereby avoiding oil leakage.

PROPELLER SHAFT—Nickel steel, with new and improved universal joints; driving pinion forged integral with the shaft.

REAR AXLE—Driving axle of floating type, with hubs mounted on tubular axle which carries the weight of the car; drive is bevel gear through clutch driven hubs; driving gear housings manganese bronze, while differential case is drop forging.

BRAKES—Hand and foot brakes, mounted on rear wheel drums, both interior expanding; hand brake pulls towards operator.

FRONT AXLE—Drop forging, manganese steel, I beam section; wheel hubs mounted on imported annular ball bearings.

WHEELS—36-inches with 1⅝-inch spokes, second growth, grade A hickory.

TIRES—Rear 36 x4½-inch, front 36 x 4-inch. Make optional.

FRAME—Pressed nickel steel, with 2½-inch drop forward of rear axle.

CONTROL—Spark and throttle on steering wheel, with stationary segment and foot accelerator pedal.

MUFFLER—Cut-out on all cars.

WHEEL BASE—119 inches.

SPRINGS—Front, semi-elliptic; rear, improved type of platform or three point suspension; size of springs greatly increased; quality of spring steel is most expensive and finest obtainable.

BODY—Double side entrance, seven passenger capacity, full aluminum, ironed for top; extra seats can be folded or removed instantly.

EQUIPMENT—Two acetylene head lights, generator, two oil side lights, oil rear light, large horn, brass coat rail, brass foot rest, tire carriers, trunk rack, tool box on step with full set of tools, including pump, jack and tire repair kit.

WEIGHT—2,850 pounds.

PRICE—$4,500.

The Pope Hartford "30" for 1908

$2750

Says the Hartford Globe, Sunday, Oct. 6th:—
"Certain it is the new Pope-Hartford is a beauty. The lengthened wheel base, the larger wheels, longer springs; the new convex body lines, the large and roomy tonneau, with large side door; the rakish steering column with larger steering wheel, with the front axle directly under the radiator, gives the car an appearance that is at once distinctive and decidedly 'smart.'"

Changes in design and construction of the Pope-Hartford for 1908 are not of a revolutionary character. The modifications adopted tending only to further refine and bring the product thoroughly in line with the best and latest practice.

The 1907 Pope-Hartford was right. It made hill-climbing, touring, track and reliability history.

The 1907 Model L is admittedly and unquestionably the speediest, most powerful, most popular and highly endorsed car in its class of the year.

Model M, its successor, has now been on the road many weeks; has been put to every conceivable road, hill-climbing, speed and reliability test.

SOME NEW FEATURES FOR 1908 ARE AS FOLLOWS:—

Selective change speed gear. Gears of Chrome nickel steel. Road wheels 34x3½ and 34x4, respectively. Wheel base 112 inches.

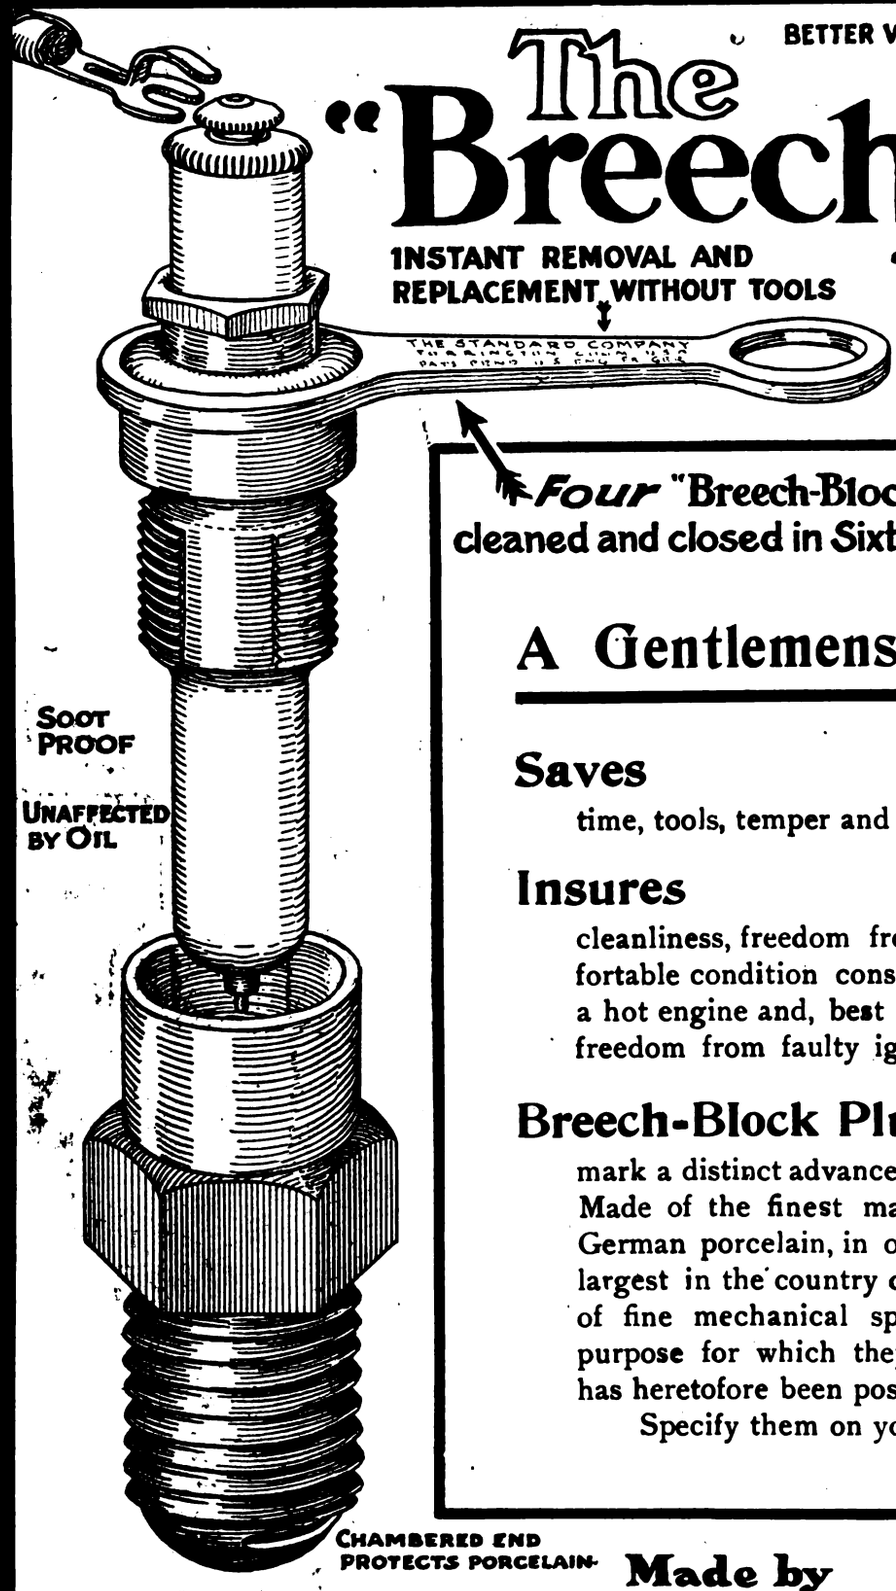
New carburetor giving all the flexibility of the multiple jet vaporizer. Quietness of operation of all gears. Radiator is now located directly over front axle.

The Clutch same as Model L, excepting cork inserts to the number of 34 have been added. Rear axle is now of the clutch drive type, rather than the semi-floating variety as used in the 1907 car.

Clutch type of axle the very latest practice. Chrome nickel steel shafts. This new clutch type of axle reduces all friction so it is now possible to push the Model M car when standing on the level with one hand.

The brakes, both internal and external, have been increased in surface, width and diameter. An important detailed improvement of rear braking construction is the taking of the driving and braking torque by the same member of the hub construction.

The steering column has been given a larger rake, and a much larger hand wheel is supplied.



The 1908 body has convex lines, is decidedly more roomy. Front springs are 2x38 and the rear 2x52. Aluminum guards with patent leather aprons.

Ask us to do any "stunt" you want; ask us to go where any car will go irrespective of make, price, horsepower or number of cylinders.

If you make the others, in and out of our class, do the same things under the same conditions, you'll buy a Pope-Hartford.

The Pope Manufacturing Company, *Members A. L. A. M.* **Hartford, Conn.**

TRUFFAULT-HARTFORD SHOCK ABSORBER

"Renders Real Rough Road Relief"

¶ The spring action of a car affects its smooth running qualities. Proper control of the springs prevents excessive oscillation, which insures LESS WEAR and TEAR, LONGER LIFE OF TIRES, GREATER SPEED AND GENUINE **COMFORT.**

¶ This control of the springs can be secured only by the use of TRUFFAULT-HARTFORD Shock Absorber—the device that has made SAFE, ECONOMICAL AND COMFORTABLE automobiling possible.

¶ In the 1908 model we believe that we have practically obtained perfection.

¶ A distinctly new feature has been added, consisting of a regulating dial with indicator, making it possible for even a novice to obtain a perfect and uniform adjustment to suit the exact requirements of the car as measured in terms of its gross weight, and easily secure the maximum benefit.

¶ The Truffault-Hartford is the only spring retarding device manufactured with a regulating dial. It is automatically lubricated, absolutely dust and water proof, interchangeable, practically indestructible and ***fully guaranteed.***

¶ Twenty prominent automobile manufacturers now use the Truffault-Hartford Shock Absorber exclusively as part of the regular equipment of their cars.

¶ Write for our "Ruff Road" booklet, Dept. I, or a demonstration will convince you—see us at the shows.

Garford

The representative car, "THE TYPE" so to speak may never have existed, but if it could be produced would be more suitable to its environment than any car existing at the same time. Every detail would have been established by evolution rather than by "personal engineering idiosyncrasy." It would be the safest car one could buy.

The design of the Garford car has been developed to come as near "THE TYPE" as possible, and embodies the experience of all cars rather than the limited experience of a few individuals working alone on a restricted line.

The fact that there are so many of you

and only one of me prevents my being able to meet every one of you who read this ad and telling you what a splendid line of cars you'll find at the "Maxwell" exhibit at the Grand Central Palace Show, October 24th to 31st.

First and foremost the new model D, Four-cylinder 26 H. P.

"Maxwell"

at $1750

stands out as the greatest achievement since the automobile was invented. It brings to the motoring public a four-cylinder touring car of the most advanced type, a car at a price extraordinarily low, supplying all the efficiency of the extravagantly priced car.

This car is the triumph of Mr. J. D. Maxwell's career—and those who know the automobile industry know that Mr. Maxwell's name heads the list of American motor car designers.

During the past year Mr. Maxwell devoted his entire time to the perfecting of this model. Though repeatedly urged he has refused until he was perfectly satisfied with the result, to put it on the market the past year.

As promised, specifications of the Model D Maxwell are here given:

SPECIFICATIONS.

Motor—Four-cylinder vertical, cylinders cast separately.
Transmission—Sliding Gear, progressive type.
Clutch—Multiple disc.
Three point suspension.
Drive—Shaft.
Frame—Pressed steel, channel section.
Lubrication—Positive force-feed.
Ignition—Jump-spark; current supplied by dry cells and storage battery.
Springs—Semi-elliptic.
Carburetor—Float-feed, giving perfect mixture at all speeds.
Cooling—The "Maxwell" thermo-siphon system of water cooling.
Bodies—Sheet metal, upholstered in leather and hair.
Wheel-Base—96 inches.
Weight—2,100 pounds.
Equipment—Three Oil Lamps, tools, horn, etc.

You will be a lot more "motor-wise" after comparing it with others—and it costs you $1,750.

Benj. Briscoe

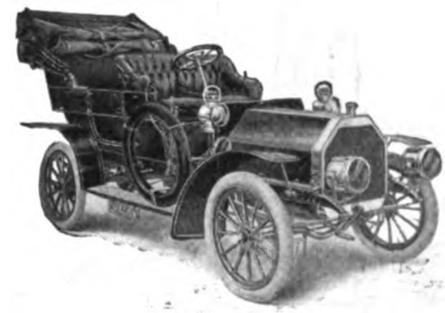
DRAGON

1908 Roadster

35 H. P., $1850

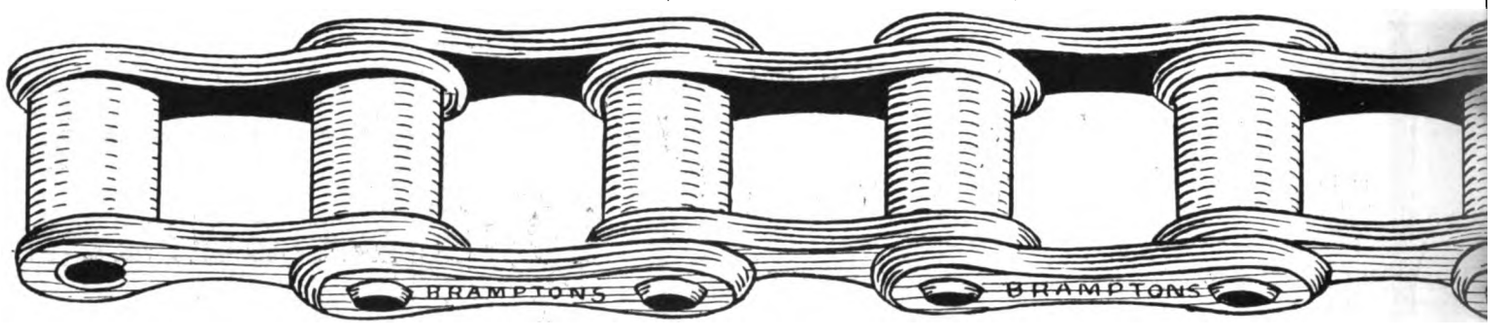


Exhibited at the Independent Show, Grand Central Palace, New York City, October 24 to 31

Four 4½ x 4½ inch cylinders, cast in pairs; valves on one side; progressive type transmission, located on rear axle; I beam drop-forged front axle, roller-bearing rear axle; 96-inch wheel base; drop frame of pressed steel; storage battery ignition; speed up to 55 miles an hour; weight 1,800 lbs.; cone clutch, leather-faced; brakes, 14-inch drums, metal to metal internal and external; ball-bearing front axle and gear box; Diamond tires 32 x 3½ inches. The price includes full equipment of five lamps, horn and tools.

The Dragon Touring Car of 1908

The success of our 1907 touring car has induced us to put a similar model on the market for 1908, embodying all the good features of the 1907 car, together with such improvements and refinements as have been found desirable and necessary. It has all the advantages of correct design, fine workmanship, absolutely best material, handsome appearance and perfect performance on the road. Excessive speed was not the object in designing the Dragon, but it will take you forty miles an hour when you care to travel that fast. Write for information.



24-26 H. P., five passenger, full elliptic springs, wonderfully easy riding, silent shaft drive, double hub brakes—$2,100 f. o. b. Philadelphia.

THE BRAMPTON CHAIN

The **stongest** chain in the world; made of **self-hardening steel** with large spun rivets, chamferred side plates (no sharp edges). All parts of this chain are polished and fit the sprockets (which are properly cut) without friction.

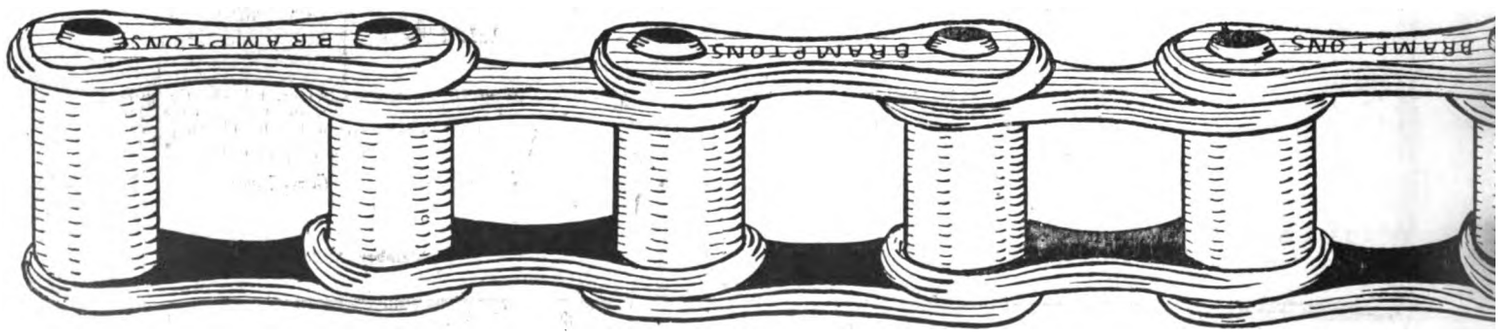
Imitation, What's the Definition?

Some chain manufacturers have copied the Brampton chain as near as they could. Their chain somewhat resembles the Brampton chain in appearance, but they have been unable to copy the material **(self-hardening steel).**

No change has been made in the construction of the Brampton chains in the past ten years. **What does that signify?**

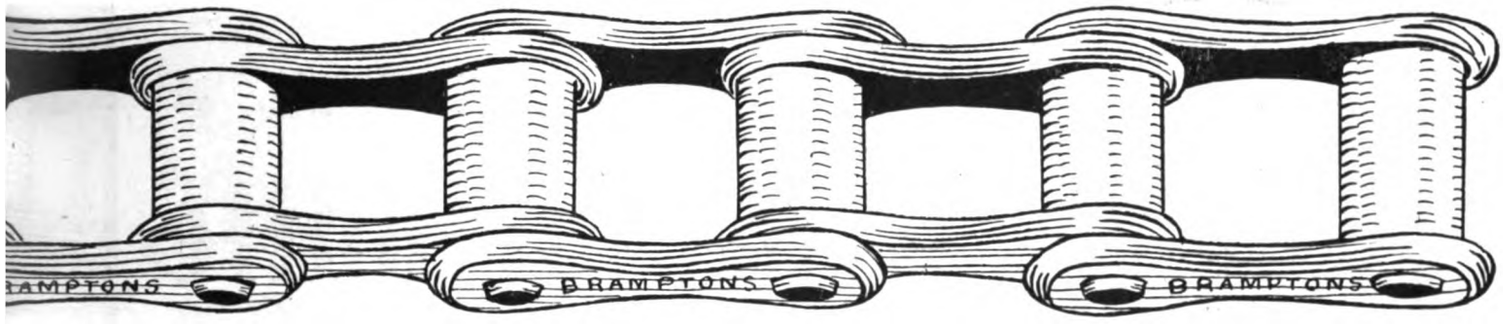
Our price list is not copyrighted and our competitors are welcome to use it. One of them has done so, using our numbers, sizes, prices and descriptive matter.

It is therefore easy to be seen that the Brampton chain is The One Standard of the World.



All Brampton Chains are stamped with the name Brampton on each outside link; Beware of the imitators and get the genuine Brampton.

PRICES THE SAME AS AMERICAN-MADE CHAINS.



We are the Sole American Agents. Catalog on request.

Price! That's The Rub

The price of the CELEBRATED BRAMPTON CHAINS, (the best in the world) is the same as the American made chains.

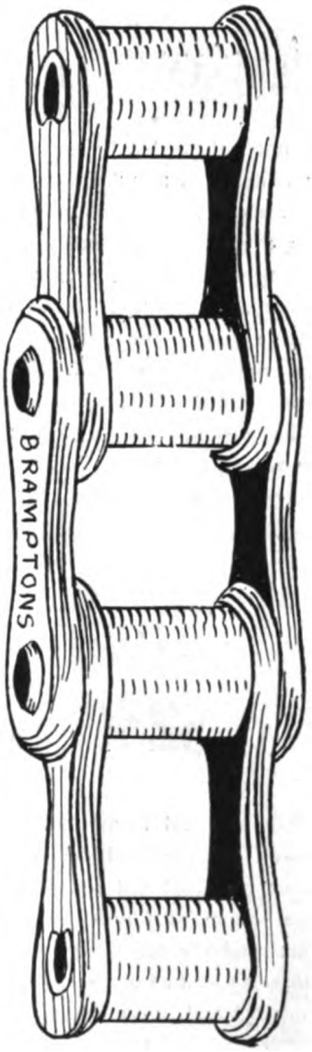
Large Sales

make it possible for us to import the CELEBRATED BRAMPTON CHAIN from England (paying freight and duty) and sell it at the same price at which the several other automobile chains are sold to manufacturers, jobbers, dealers and users.

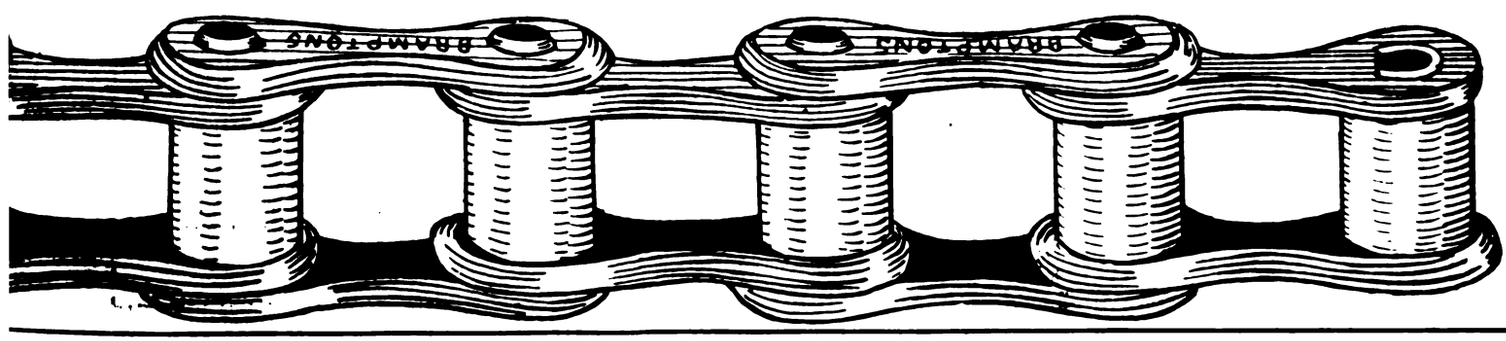
Price Being Equal

What would you do?

The manufacturers of American motor cars will fit the BRAMPTON CHAIN to your car if you order that way—no extra cost to either you or the manufacturer.



We carry in stock all BRAMPTON Standard Sizes to fit American and Foreign cars.



PRICE, the same—QUALITY, that's DIFFERENT.

The Kiblinger

Automobile Buggy

is not only a decided success at the present time, but it is destined to take the place of the horse and buggy in almost every community. So great is the demand for the Kiblinger Auto among Physicians, Rural Mail Carriers and Farmers that Dealers cannot fail to do a large and profitable business selling these machines. Write to-day for complete catalogue illustrating and describing our six different Models. We build a 4, 6 and 10 H. P. Runabout, also a 4 passenger car with folding seat, which makes it very easy for the Dealer to secure orders.

Discounts and terms mailed on request. Get the agency in your territory before it is closed.

The Price Is $250 to $500

Our Model D as above illustrated has Double opposed cylinder and develops 9-10 H. P. This is the most practical and reliable machine on the market for the service of Physicians, Rural Mail Carriers, and in fact anybody requiring an automobile for business purposes as well as pleasure. This machine has two speeds forward and one reverse and will climb any grade not exceeding 30%. Negotiates muddy or sandy roads with perfect ease. It will travel 6 to 25 miles per hour on high speed and consumes 4 gallons of gasoline per 100 miles.

Don't fail to see our exhibit of the original Motor Buggy at the New York Automobile Show in October.

AGAIN TO THE FRONT

Cadillac

Model G

In the races at Harlem track, Chicago, Oct. 12th, the 20 H. P. $2,000 four-cylinder "Model G" Cadillac again covered itself with glory. The car was a stock runabout which had received no special preparation aside from the removal of running boards and fenders.

It won the five mile contest, defeating a 24 H. P., a 30 H. P. and a 40 H. P. six cylinder car and others.

It also carried off the honors in the principal event of the day, a half-hour invitation race, covering 23¾ miles, or a rate of 47½ miles per hour, defeating a 55 H. P., a 30 H. P., a 60 H. P., a 40 H. P. six cylinder and a 55 H. P. six cylinder.

The Cadillac victories were especially significant from the fact that its rated power was the lowest in the entire entry list, viz.: 20 H. P., and its competitors were rated all the way from 50 to 200 per cent. higher and some of them listing at over double its price.

While the higher powered cars showed great spurts of speed for short distances at times, it was the even running, even balance and unfailing constancy of the Cadillac which enabled it to win.

If it is constancy, ample speed, and ample power you are looking for, the features that make automobiling a pleasure, get a demonstration in a "Model G."

WE ARE DELIVERING 1908 MODELS.

Rambler
Automobiles

For the year 1908 the entire facilities of the Rambler factory will be devoted to the production of two Models, 34 and 31.

Model 34, a five-passenger touring car with four-cylinder vertical motor, 32 horse power, has selective type transmission with shaft drive. The wheel base is 112 in., wheels 36 in., with 4-in. tires. Price, fully equipped, $2,250. The same chassis, however, with appropriate changes in detail, will be equipped with a roadster body with rumble seat, at the same price.

Model 31 is a five-passenger touring car with detachable tonneau, equipped with the Rambler unit power plant, comprising double opposed motor, multiple disc clutch and planetary transmission entirely enclosed. Price, fully equipped, $1,400. This model can be furnished with torpedo deck in lieu of the tonneau, at $1,300.

Both models have been brought to the highest possible degree of perfection in every detail that insures

Service, Economy and Comfort

A complete line of 1908 Ramblers will be shown at a private exhibit at the salesrooms of the Homan & Schulz Company, 38-40 West 62d Street, New York City, during both New York Automobile Shows.

You cannot afford to miss making a critical inspection of these 1908 models of

The Car of Steady Service.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, October 24, 1907. No. 4

YULE TO ACT AS CO-RECFIVER

Creditors' Chairman Will Assist in Straightening Pope Affairs—Sale of Pope-Toledo Plant in Abeyance.

With the consent of the creditors and agreeable to the Pope interests, George A. Yule, president of the Badger Brass Mfg. Co., Kenosha, Wis., is to become co-receiver of the Pope Mfg. Co. and the Pope Motor Car Co., to act in conjunction with Receiver Albert L. Pope. The court order for Mr. Yule's appointment now is in preparation.

Mr. Yule, who was active in calling the Pope creditors together at the time the embarrassment of the big companies first occurred and who since has been acting as chairman of the creditors' committee, which grew out of that meeting, is generally reckoned a clear-headed, conservative business man who will be able to render valuable assistance in straightening out the Pope affairs. His appointment as co-receiver will also considerably relieve Receiver Pope, the division of duties saving the latter much time spent in traveling and in attending meetings in the West and dealing with other matters affecting that part of the country to which Mr. Yule will be able to devote himself.

The sale of the Pope-Toledo factory is in statu quo. It transpires that the offer made for purchase was merely an oral proposal and has not been placed in such form as to receive formal cognizance or to permit of its being presented to the courts. It also develops that in making the offer of $1,000,000—$400,000 in cash, the remainder in bonds—A. E. Schaaf, the manager of the Pope-Toledo plant, was acting not for Charles F. Schwab, the steel magnate, but for the latter's brother, Joseph.

To Produce Bearings in Nebraska.

The Bearing Company of America, of Omaha, which has been incorporated under the laws of Nebraska, with capital stock of $150,000, has leased and is installing machinery in a disused street car power house at Nineteenth and Nicholas streets, Omaha, and expects to begin operations within two weeks. The concern will manufacture bearings made under the patents of George J. S. Collins, and which the producers think "will be used by all the automobile manufacturers in the country." The officers of the company are: President, Arnold C. Koenig; vice-president and general manager, George J. S. Collins; treasurer, Lysle I. Abbott; secretary, Will F. Seidentopf.

Warren Becomes Sales Manager.

Frank J. Fanning, sales manager of the Haynes Automobile Co., of Kokomo, Ind., has resigned that office to engage in partnership with James Levy, of Chicago, agent for the Autocar and other cars; his resignation will become effective after the Madison Square Garden show. Mr. Fanning will be succeeded by C. B. Warren, who for several years has been manager of the New York branch of the Haynes company. Mr. Warren, during his term of office in New York has been most active in his position, having disposed of more Haynes cars in New York than ever were disposed of by any previous manager.

Winchester Speedometer Stops.

On Friday last, 18th inst., Irving Washburn was appointed temporary receiver for the Winchester Speedometer Co., New York, the action being taken on the petition of three directors for a voluntary dissolution. The concern made what was formerly styled the McGiehan speedometer but did not sell enough of them to create much of a stir. Its liabilities amount to $4,977 and its assets to $1,712.

Bell Trustee for Deere-Clark.

At the meeting of the creditors of the Deere-Clark Motor Co., Moline, Ill., last week, Benjamin S. Bell was chosen trustee. It is stated that a new company may be formed, although the trustee has applied for permission to sell the property.

TO TURN GOVERNORS INTO MONEY

Lee Ephraim's the Boy Who Can Do It!—He Offers an Unparalleled Opportunity for Automobile Manufacturers.

Lee Ephraim is "the goods," and if during show time he is not surrounded by clamoring manufacturers it will be due to no fault of his own. For it is he who holds the key that will unlock the opportunity of a lifetime.

Lee has been an object of keen interest before. Only a few short years ago, he and his brother were in the supply business in Buffalo, and they made such a picturesque failure and in due course Lee made such a wonderful witness that his fame is secure for all time. After his doting creditors had let up on him he came to New York and set up in the sale of second hand and third hand cars, while his brother journeyed to San Francisco where he earned so much of the love of others in the supply business that they look back on the earthquake as a deliverance from some evils at least. Meanwhile Lee has drifted out of old cars and into the sale of new gas tanks. The tanks are empty ones, but there are those who maintain that Ephraim can supply all the gas that may be necessary.

Perhaps it is due to this likelihood that he is enabled now to offer to automobile manufacturers an unparalleled opportunity. His proposal smacks somewhat of publicity promotion, but even if Lee has not organized himself into an association, he is training for entry into that class of press agents that can, to order, "pull off" a hill climbing contest or even a road race for Charity'$ sake. After a fashion Ephraim's scheme makes a "charity" road race look like 29 cents, for while benevolent press agents bait their hooks with sheriffs and the like, Lee is not angling with such small bait. Nothing less than a governor, or rather a string of governors for him!

When he unfolded his magnificent project to an awe-struck manufacturer during

Digitized by Google

the past week, he said he had already written to and "landed" eight or ten governors, and that the fishing still was good—that they had expressed the great pleasure it would afford them to drop the cares of State and to ride with such distinguished gentlemen when he called. A camera forms a part of the plot. It will be concealed about the Ephraim person and be "snapped" at the proper moment.

It appears to be Eph's idea that a photographic collection composed of pictures of governors, all seated in the same car and flanked by Mr. Lee Ephraim, will simply set the world afire and cause such a rush for the car in question that the manufacturers of it will have to turn the flood of money in his assembling room.

Lee appears to have secured the camera. All he now requires is a manufacturer able to realize the full merit of his enterprise sufficiently to let him have a car and a chauffeur. The name of the car or of the driver makes no difference to Lee. Oh, yes—and he wants also a mere trifle of $5,000 and expenses for the prodigious task of turning governors into money; he evidently figures that the sale of gas tanks—empty—"on the side" will prevent him from starving.

The enterprise is so stupendous, the opportunity so unparalleled, and the Ephraim reputation so high, that it does not seem possible that less than 57 varieties of manufacturers will be willing to toss $5,000—and expenses into his lap. Therefore apply early and avoid the rush!

Captures Cadillac Tire Order Again.

All 1908 Cadillac cars are to be fitted with the Midgley universal rim, which in almost natural sequence means that they will be fitted with either Hartford, Morgan & Wright or G & J tires. Those tires will be used exclusively and, of course, their makers consider that having again booked the big order in the face of keen competition, it conveys a wholesome moral.

Motor Buggies with Friction Drive.

The Commercial Automobile Co. have set up a plant at 1408 West Fifty-sixth street, Chicago, which already is at work on a line of cars of the motor buggy type, which shortly will be styled and placed on the market. The vehicles, one of which is a truck, will be styled the Hennegin, and will employ a double-opposed motor, a friction drive and 40-inch wheels.

Drake Resigns as Fisk Manager.

F. A. Drake, who succeeded J. W. Bowman as manager of the Fisk Rubber Co.'s New York branch, has resigned that office. His successor has not been appointed.

Pittsfield Spark Coil Increases Capital.

The Pittsfield Spark Coil Co., Dalton, Mass., has increased its capital stock from $20,000 to $100,000. The added $80,000 already has been paid in.

The Week's Incorporations.

Canton, Ohio.—Havana Auto Cab & Garage Co., The, under Ohio laws, with $10,000 capital. Corporators—L. S. McIrwin and others.

Denver, Col.—Felker Automobile Co., under Colorado laws, with $40,000 capital; to deal in automobiles. Corporators—Delia W. Felker, W. L. Dayton and G. A. Maxwell, all of Denver.

Lincoln, Neb.—Standard Automobile Supply Co., under Nebraska laws, with $10,000 capital; to deal in automobiles and accessories. Corporators—Ole Hibner, H. D. Boodwin, and Martin J. Wolf.

Bayonne, N. J.—William Sandford Co., under New Jersey laws, with $10,000 capital; to deal in automobiles and accessories. Corporators—William Sandford, Charles R. Goldman and John L. Woolson.

Chicago, Ill.—Forty-third Street Automobile Co., under Illinois laws, with $40,000 capital; to deal in, store and repair automobiles. Corporators—Arthur B. McCord, H. J. Osdick and George C. King.

Springfield, Mass.—H. C. Medcroft Automobile Co., under Massachusetts laws, with $35,000 capital; to deal in automobiles, etc. Corporators—D. E. Leary, president, and H. C. Medcroft, treasurer, both of Springfield.

Seattle, Wash.—Queen City Motor Car Co., under Washington laws, with $10,000 capital; to deal in automobiles, etc. Corporators—W. E. McKenzie, Edward Ferris, Frederick Haggist, A. F. George and C. E. Hagyard.

New York City, N. Y.—Motor Car Maintenance Co., under New York laws, with $10,000 capital. Corporators—Nicholas Betajmin, 25 Broad street, New York City; William H. Webster, Pelham, and Thomas J. Toner, Tarrytown.

New York City, N. Y.—Fiat Automobile Co., under New York laws, with $100,000 capital; to deal in automobiles. Corporators—William F. Ashley, Jr., 40 Exchange place; Henry M. Wise, and Robert W. Ashley, 141 Broadway, New York City.

Wilmington, Del.—McCarthy Steel Car Tire Co., under Delaware laws, with $10,000 capital; to manufacture automobiles and kindred products. Corporators—Thomas J. McCarthy, Los Angeles, Cal.; Benjamin Mann, Philadelphia, Pa., and William H. Wallace, Wilmington.

Epidemic of Fires in Garages.

There has been an epidemic of fires recently. Thomas Gehringer's garage at Allentown was damaged on October 13th, together with a touring car. The damage was estimated at $3,000. The garage of C. J. Bousfield at Bay City, Mich., was burned on the 15th. Two cars were destroyed. Loss, $7,000. Several automobiles and buggies were destroyed in a fire which burned Juseph King's garage at Menominee, Mich., 12th inst. Damage, $8,000. Spark from a match fell into a gasolene tank of a car in William S. McKinney's garage at 310 Aiken avenue, Pittsbury, 14th inst. The loss was $5,000. The same amount was the extent of damage caused by fire at the warehouse of the Jonas Automobile Company, Eleventh and National streets, Milwaukee, 19th inst. The origin is unknown. A loss of $10,000 at the building owned by the Quaker City Motor Co., at 50 North Twenty-third street, Philadelphia, 16th inst., completes the list.

Freeport Clung to Shoemaker.

Freeport, Ill., did not speed its parting resident, the Shoemaker Automobile Co., which so recently accepted an invitation from Elkhart, Ind., to locate there. Instead, while eight carloads of the concern's machinery and merchandise were on the railroad tracks awaiting shipment to Elkhart, they were attached by the State Bank of Freeport for a debt of $10,000. The affair gave rise to unpleasant talk, some of which scored the sheriff's office "for suppressing matters of public record." The trouble, however, appears to have been straightened out. It was attributed to "the absence of certain bank officials and misunderstanding of details by others."

Post Once More in Harness.

Wallace B. Post, for so many years "envoy extraordinary" for the Billings & Spencer Co., Hartford, Conn., and one of the most wholesouled men that ever booked an order, is again able to attend to business. For the past six months Post has been practically blind, but care and attention have restored his sight and he is himself once more.

Ford to Use Firestone Tires.

The Ford Motor Co.'s order for tires to meet their entire requirements for 1908, has been captured by the Firestone Tire & Rubber Co. It probably is the largest order ever placed for pneumatic tires, and is in the nature of a tribute to the quality of the Firestone tires, of which the Ford people used several thousands during the current year.

New York Branch for Babcock.

On November 1st, the Babcock Electric Carriage Co., of Buffalo, will open a branch house in New York at 1591 Broadway. It will be in charge of H. E. Wagner, who will have the title and duties of general eastern sales manager.

Cordner Goes to Studebaker.

E. Q. Cordner, manager of the Chicago branch of the Rainier Motor Car Co., has resigned that office to become manager of the automobile department of the Studebaker Bros.' Chicago house.

ROAST PIG, FACTS AND FIGURES

They Form the Features of Licensed Association's Reception to Newspaper Men —Figures Prove Big Business.

Nearly all the writers and other newspaper workers who will paint word-pictures of the two New York automobile shows during the next two weeks now are well fortified for their tasks. On Monday last, 21st inst., the Association of Licensed Automobile Manufacturers, the sponsors of the Madison Square Garden show, made them its guests and stuffed the whole lot "full up to the neck," with roast pig. The stuffing was done at the Chateau des Beaux Arts, at Huntington, L. I., whither the entire party was conveyed in nineteen 1908 cars, all of which, needless to add, were of the licensed brand, the demonstration of which was an incidental feature of the occasion. The repast was styled a "roast pig luncheon," but, of course, there was more than pig that tickled the palate and more than water that washed it down.

The always-cordial George Pope acted as master of the few ceremonies, and after bidding the guests welcome, made a short address pregnant with hopeful facts and impressive figures. Among other things, he said:

"These 1908 models, which we have had the good fortune to see practically tried out this early, are undoubtedly the finest products in the line of motor cars yet seen and they are destined to sell readily.

"I want to say that in spite of the depression of the stock market, the talk of hard times and the doubts cast upon the wisdom of holding early shows, that the automobile industry is right now flourishing and its prospects are fine. You may take is from me as a manufacturer and one who knows what is going on, that fall orders for immediate delivery of 1908 models are being received by all makers of standard cars.

"The automobile business of 1907 far surpassed that of 1908, and there is good reason to believe that the business of 1908 will show quite as great an advance.

"A long period of weather prejudicial to automobile business was experienced during the early months of this year and there was good reason to fear that the year would show a declination in sales of cars. The facts are interesting. There was no frantic rush of purchasing at any time, but sales were made steadily from about May 1st till October 1st. There has been a longer selling season this year than at any time since 1903 and 1903. The returns upon the sales of cars made by members of the Asciation of Licensed Automobile Manufacturers, who pay royalty upon their output, enable me to speak from exact figures.

"The business done by the licensed makers during the first six months of 1907 was nearly as great as during the whole of 1906. The sales of the 1907 half year amounted to $40,000,000, while for the whole of 1906 they were only $45,000,000. The sales of the first nine months of 1907 have surpassed the total of 1906 by more than $5,000,000, and the total business of this year will exceed that of last year by at least $15,000,000. This is to say that the total business done this year by the licensed makers will show a gain of at least 33⅓ per cent. over 1906.

"The figures justify an optimistic outlook for 1908, as does also the quality of the cars themselves. The American car has rapidly attained the excellence of the foreign product; and it has even demonstrated itself superior for the roads of this country. The industry has withstood the trials of unfavorable weather and the blows of a panicky stock market and is still in good condition as a whole. Every circumstance warrants confidence in a prosperous future for the conservative maker and dealer."

Besnard System for Solar Lamps.

The blinding glare of the acetylene lamp, which, from the standpoint of other road users and of the public generally, has constituted one of the evils of automobiling, is in a fair way of being subdued, or at least controlled. Alive betimes, the Badger Brass Mfg. Co., makers of Solar lamps, have secured the American rights of the famous Besnard system which attains that end. In substance the system affords what may be styles a double light; it both projects and diffuses the rays and includes a shutter operated from the seat by a small lever and a flexible shaft and which, when desired, shuts off the projected and blinding rays, leaving only the diffused illumination; both headlights are connected so that the one lever operates the shutters of both. The Solar people adopted the Besnard system only after many months of experimentation and considering the far-reaching benefits which it affords they very rightly esteem it as a giant stride in lamp manufacture and one that will meet with quick recognition.

Matlack Made Michelin Manager.

J. C. Matlack has been elected vice-president and general manager of the Michelin Tire Co. of America. Matlock was general manager of the International A. & V. Tire Co., at Milltown, N. J., when its plant was taken over by the Michelin interests and was named as the Michelin agent at the time the American company was incorporated. C. C. Harbridge, who is well known in the trade, is to have the management of the Michelin Chicago branch.

Atwood Moves up Aldrich.

R. D. Aldrich, sales manager of the Atwood Mfg. Co., Amesbury, Mass., has been elected secretary of the company. The promotion comes as a well earned reward, as Mr. Aldrich "made good" on the road, winning many friends for himself and the Atwood line of lamps.

AUTOMOBILE ART AT CHICAGO SHOW

One Hundred and Fifty-two—Count 'Em— Oil Paintings Included in Decorations —More Space Obtained, too.

In addition to being an automobile exhibition, it seems probable that the Chicago show, which opens November 30th, will be something of an automobile art gallery, also. For included in the plan of decoration there are 142 oil paintings, all of automobile subjects, and which will cover 8,704 square feet of canvas. Of these pictures 112 will form a part of the background of the booths. They are being made by Haratta, one of the foremost of Chicago's artists. The remainder, covering a space of 8 by 668 feet, will encircle the building, around the gallery front.

The first samples of the arches which are to form the setting for the Maratta pictures have arrived in Chicago and are pronounced superior to last year's work.

As there are fifteen makers of automobiles and forty makers of accessories on the waiting list, some additional space has been pressed into service in the Coliseum basement, making room for three of the automobile manufacturers who had been left out. The west end of the First Regiment Armory gallery will also be used, making room for about ten additional exhibits of accessories. Some of those on the waiting list probably will be located in the commercial vehicle section, in which 26 makers of such vehicles have engaged space, with four more in prospect.

Warner Makes Aggressive Moves.

Having decided to stand by their price on the Autometer and to "cut loose" from jobbers, the Warner Instrument Co. is pursuing its agressive policy with renewed vigor. Further evidence of the fact is contained in the appointment of Clarence A. Shaffle, an experienced territorial typewriter manager to a permanent station in San Francisco, from which he will regularly "cover" California, Oregon and Washington, and in the establishment of a "department of promotion," in charge of Edgar W. Jordan, former advertising manager of the Shaw-Walker Co.

Turns from Incubators to Motor Cars.

Having made a success of incubator manufacture, M. M. Johnson, of Clay Center, Neb., now is preparing to hatch automobiles. To that end he has purchased the plant and machinery of a one-time grain drill concern, and will turn it to use in the production of motor cars. According to a Clay Center correspondent, "Mr. Johnson has some new and original ideas which he proposes to develop in the form of a machine at a price within the reach of a large class of people."

NEW YORK, OCTOBER 24, 1907

The Promise of the Show.

Now that the automobile, generally speaking, is a pretty well developed piece of man's ingenuity and handiwork, even the half-informed visitor no longer looks for "startlers" at the annual exhibitions. The casual dropper-in probably will linger longer and find more to whet his curiosity in the motor buggies than in the big touring cars and limousines.

But for all of that, the foreshadows of the Palace show, as depicted elsewhere in the Motor World, indicate quite plainly that designers have not been content to rest on their laurels. Apart from new cars made by new manufacturers which are but just making their first bid for public favor, the older and established manufacturers will demonstrate that they have still further profited by ripe experience. While they have not been able to perform any wonder-working, their 1908 models constitute evidence that the refining hand found more room for work than there was reason to expect would prove the case.

Nor have the producers of parts and accessories stood still. The volume of newness which the show will disclose is of surprising extent. Even in respect to tires, which it was supposed had settled into pretty well defined channels, there is newness, not of the freakish sort, but coming from makers of the proudest repute.

The man who merely skims the surface of the show probably will find little to satisfy curiosity, but the one who really seeks for it, will discover very much that is not only interesting but instructive and "primed" with a reading of the Motor World's forecast his task will be rendered very much easier.

The Passing of "The Game."

Indications make it appear that the 1908 shows, which paradoxically will occur during 1907, will mark the flood tide of the industry.

The shows, the first of which will be inaugurated in New York City this evening, will mark also the beginning of the transition of the industry from a game to a business.

Of late years it has been the popular habit to style practically every pursuit of life a "game"; and never was the term better applied than to the methods employed by not a few of those engaged in automobile manufacture. To them it has been, in truth a game. The stake has appeared a rich one and the temptation to "sit in" and play high with limited capital, or insufficient skill or both, has been great. It has attracted many moths to the flame. It is not strange that the wings of some have been singed and that many more have been wholly devoured by the fire.

Of 66 American automobile manufacturers who exhibited their product at last year's show in the Grand Central Palace, one-fifth will be missing from the function which begins this evening. Twelve of the 66 who "sat in the game," drew poor cards or found the gaming so swift and so strenuous that they were forced to quit, receivers appointed by the courts taking charge of their wreckage; four others at least were singed and crippled by contact with the flame. And this is without reference to those manufacturers who exhibited at other shows or no shows, who also played their cards and lost.

The industry is not yet free of those to whom it is but a game. Some of them are "squeezing" their cards hard and to them the shows themselves are the green tables at which they are seated, and which will bring good luck or ill.

Probably this sort of thing occurs in the early life of every industry. It has been aggravated in the case of automobile manmanufacturers by mirrors, which have seemed to reflect only mountains of gold that have lured on those fortune seekers who not unnaturally prefer the shortest cut to wealth.

With the fading of the reflections the industry rapidly will cease to be a game. It will become a business in which the fittest will survive and they who will survive are those who are well entrenched and with flags flying that bespeak proud reputations and the staffs of which rest not so much on the foundations of to-day as on those of to-morrow. In other words, the time has arrived when reputation counts and will bring its full reward to those who possess it.

For the Ladies' Sake.

Although a few of the big runabouts still are distinguished by rumble seats, the very sight of which is suggestive of discomfort, the vast majority have been greatly improved in that respect; their rather precarious rear perches also have been made safer by the quite general adoption of hand rails, thus at last reducing the hazards to which "the man behind" is subjected.

There is one other detail in which such vehicles may be made at least more convenient, not for the occupants of the rumble, but for the woman passenger. Few self-respecting women ever will be content to use the rear seat; it was never designed for woman's use, and few men with any regard for propriety, ever will permit her to occupy it. Her place is in the seat beside the driver, and it is in this fact that the room for improvement lies.

In New York and in some other cities the traffic regulations require that when stopped all vehicles shall have their right sides to the curb. As the big, nominally two-passenger runabouts are all steered from the right hand side, such regulations mean that to either enter or leave the car the passenger must step from the sidewalk onto the street, very much as was the case with the old rear entrance tonneau.

That such a procedure is not either desirable, convenient or in "good form," par-

Digitized by Google

ticularly where a woman is concerned, is self-evident. It suggests the advisability of removing the steering wheel from the right to the left hand side of the car. It is certain at any rate, that whoever uses a runabout of the sort in New York's downtown district will discover that a change of the sort is very much to be desired.

New Order of Salesmanship.

Altering conditions in the automobile business have brought about a great change in the kind of salesmen required for the retailing of motor cars. Instances of "black sheep" of wealthy families, who, having failed at everything to which they have previously been put, drift into the selling of automobiles to their social acquaintances and soon make "barrels of money" for themselves, grow constantly less frequent and will soon become almost impossible. In competition with the trained salesmen of the present and future, these aristocratic dabblers will have little chance, particularly in view of the growing familiarity and keen interest in the mechanical features of the automobile which the public at large is evincing.

When the motor car was new and could only be regarded as something representing a luxury of extravagance, the function of the sociable cap with a host of wealthy friends was valuable in introducing it. He had no need of impressive patter about differentials, transmissions, ignition systems and mechanical refinements, to sell cars. Had he talked of such things he would have been voted a bore, because his hearers would have been unable to comprehend him. It was sufficient that he should let choice spirits of his own rollicking disposition, but with more money, taste the joys of motoring, feel the thrill of handling a steering wheel and realize that possession was theirs if they had the price. And with good effect he could "cut in" where susceptible members of the fair sex were not averse to participating in the new sport, creating an envy that suggested the acquirement of a car to the minds of the young bloods who were left behind. In fact the very exclusiveness of motoring lent a peculiar advantage to him who was deepest in the convivialities and foibles of the idle rich. In a degree the sale of motor cars was along wine-agent methods, where either studied or spontaneous recklessness and irresponsibility, with the proper touch of sang-froid, were commercial assets.

But champagne methods are fast disappearing. People buy cars in the same cold, calculating spirit that they would buy hard coal for the winter, or a new lawn mower. Any prospective purchaser can get a host of advisers who will tell him to look out for this point and that until the importance of the mechanical side of the question assumes the utmost importance to him. The salesman who lands his order is the one who has the convincing argument in competition with a dozen others whose arguments almost convince. There is an advantage to an automobile salesman in having a wide acquaintanceship and in knowing how to use it without impairing it, but in a match between trained salesmanship alone and wide acquaintance without training or great natural ability, the former will from now on be constantly the victor. One of the most successful sales managers in the country has found that men who have undergone the schooling of the great cash register and adding machine concerns, where the salesmen are taught in a most thorough manner, make records in selling automobiles that completely eclipse the less aggressive methods of the motor car salesmen who have been able to sell cars principally through wide social relations.

The changed conditions and the growing competition in the trade make it harder and harder for the class of salesmen who have in the past found in the automobile business a means of "easy money." Conversely they make the rewards bigger and more certain for the salesmen who can apply real salesmanship and enterprise to the retailing problem, without regard to social pull or wealthy relatives. The keener the competition the greater will be the premium on ability, in battles where wit and stamina count.

Subduing the Blinding Glare.

The fact that there finally is to become available a means of controlling and subduing the blinding glare attendant on the use of the gas headlights employed on motor cars is in the nature of tardy but welcome news. For if the whole truth be told, the glare of the big lamps has constituted a real evil and a dangerous one.

However advantageous to the man behind the wheel, the projected brilliancy is a menace to the safety of every person approaching from the opposite direction, whether afoot or awheel. The light is not only blinding but bewildering and the number of persons it has caused to "take to the woods" or to the roadside ditches or the number of accidents for which it has been responsible never will be done. But that the number is not small is reasonably certain.

As the Motor World long ago remarked, it always has seemed possible that a hood of some sort could be applied to the lamps that would at least reduce the evil, and now that it has been made possible to fully control the glare and to employ and suppress it at will, every real friend of automobiling will earnestly hope that the means speedily may find its way into universal use. It is needed and needed badly and it will remove one more of the objection which so many of its enemies have so readily brought to bear.

COMING EVENTS

October 26, Allentown, Pa.—Race meet at fair grounds track.

October 24-31, New York City—Automobile Club of America's eighth annual show in Grand Central Palace.

November 2-9, New York City—Association Licensed Automobile Manufacturers' eighth annual show in Madison Square Garden.

November 9-16, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show at First Regiment Armory.

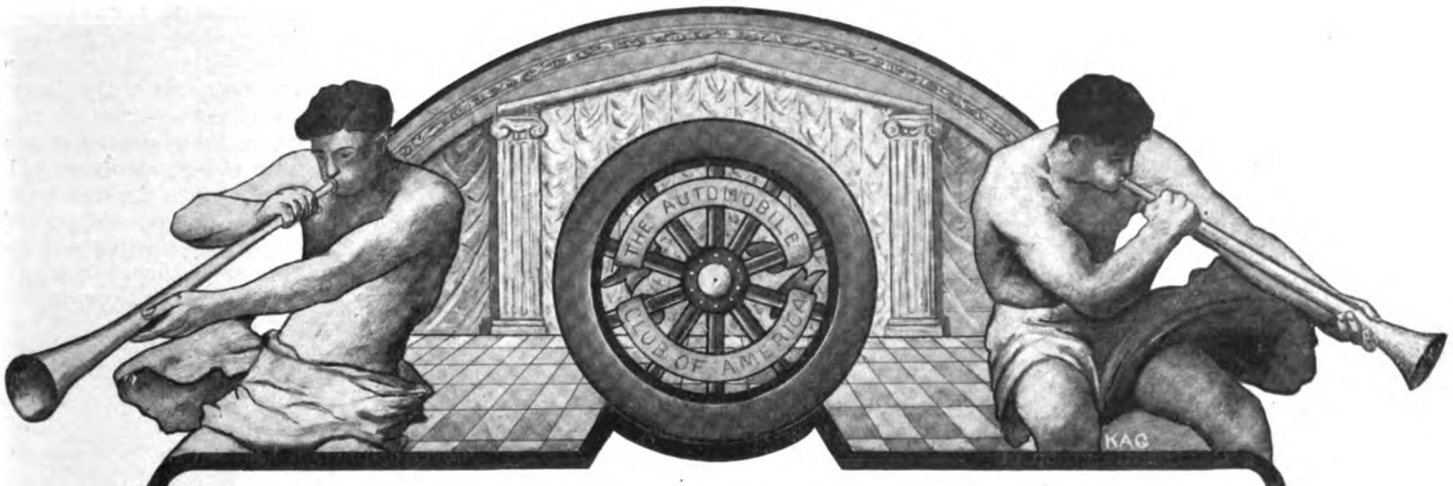
November 15-16, Newark, N. J.—New Jersey Automobile and Motor Club's 24-hour endurance contest.

November 26, 27, 28, Chicago, Ill.—Chicago Motor Club's three days' 600-mile reliability run.

November 30-December 7, Chicago—National Association Automobile Manufacturers' first annual exhibition of commercial motor vehicles in 7th Regiment Armory.

November 30-December 7, Chicago—National Association Automobile Manufacturers' Annual show in Coliseum and First Regiment Armory.

December 9-14, Detroit, Mich.—Detroit Automobile Dealers' Association's show at Wolff's pavilion.



January 14-18, Hartford, Conn.—Hartford Automobile Dealer's Association's annual show in Foot Guard Hall.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sportsmen's Association's show in Light Guard Armory.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's show.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association show in Duquesne Garden.

Palace Show and What It Promises

Since the time of the late Mr. Shakespeare the assurance has been handed down, "The show's the thing."

Since automobile shows became the vogue and particularly during the last three years it has become necessary to ask, "Which one?"

It is a rather natural question for during this latter period, the automobile situation has been a changing and a strenuous situation.

The division of the trade into two camps, those who are for and those who are against the Selden patent, has put an edge on the razor of competition so keen that it has "forced" the show season, until the spectacle now is presented of two 1908 exhibitions being held while the embers of 1907 still glow bright and red and both of which are open to the whole public.

The first of them will be inaugurated this evening at 8 o'clock, when the doors of Grand Central Palace, New York, will swing wide open and disclose the eighth show in the promotion of which the Automobile Club of America has been engaged, and the third in which it has had the co-operation of the American Motor Car Manufacturers' Association, which represents that part of the industry which is against the Selden patent. It is a numerous part as the show will testify.

Whether it is the show that will prove "the thing" remains to be seen.

If the "Which one?" question was put to Benjamin Briscoe, the head of the American Manufacturers Association, or to William Mitchell Lewis, the chairman of its show committee, or to Alfred Reeves, the galvanic manager of the association—if the question were asked of Gen. George Moore Smith, the A. C. A. chairman, or S. M. Butler, the hardworked secretary of the A. C. A., there is no doubt what their answers would be, if, indeed, they did not answer the one question with another—"What constitutes 'the thing'?" which is even more difficult of reply.

Calendar for the Week.

Thursday, October 24.
Private view of exhibition for A. C. A. members, 4 to 6 p. m.
Formal opening of the Show, 8 p. m.

Friday, October 25.
Merchants' night.

Saturday, October 26.
Smoker, Automobile Club of America, 10.30 p. m.

Sunday, October 27.
Open house at Automobile Club of America.

Monday, October 28.
Engineers' night.
Meeting Committee of Management, American Motor Car Manufacturers' Association, 10 a. m.

Tuesday, October 29.
(Society night.)
Admission $1.00 instead of 50 cents.
Second annual show luncheon of the American Motor Car Manufacturers' Association at Hotel Manhattan at 1 p. m.
Meeting American Motor League, Grand Union Hotel, 8 p. m.

Wednesday, October 30.
Military night.
Conference of Committee of Automobile Manufacturers on track racing.
Meeting directors Motor and Accessory Manufacturers' Association, 10 a. m., Hotel Belmont.
Conference, automobile trade associations with American Automobile Association, 437 Fifth avenue, N. Y., 4 p. m.

Thursday, October 31.
American Automobile Association annual meeting.

They are the men who have borne of the the brunt of this Palace show and that they have borne it well, the show itself will demonstrate.

That it will prove the most eye pleasing exhibition with which the A. C. A. and the A. M. C. M. A. have had to do is certain Grand Central Palace is so constructed interiorally that it does not readily lend itself to decoration, but simple though it may be, the dressing of autumn foliage, harmonizing with a soft green background and dark red carpeting should afford the out-of-doors atmosphere that has been sought and prove both uncommonly agreeable and effective.

The fact that a number of the partitions which divide the Palace into so very many rooms, galleries and passageways, have been removed for this occasion, should also render the show more agreeable and more satisfying from the visitor's standpoint and assist in the effectiveness of the exhibition as a whole.

The roster of the show includes the names of 64 manufacturers of cars of one sort or another. Mainly their product is of the pleasure type but five of them devoting themselves to the commercial field. One of the latter, The Lansden Co., the sole representative of the electric vehicle industry showing at the Palace, also produces a line of pleasure cars. Seven of the makers included among the three-score builders of pleasure cars, however, also construct utility vehicles, and several of them will show commercial applications of their product in one form or another. The gasolene engine will be the dominent feature in the way of the prime movers, the Lans-

Digitized by Google

den electric, and the Lane steam cars being notable exceptions to the rule.

The tourist of the show will find 13 cars which are entirely new, which never have been shown at any exhibition of this sort, and which will be of absorbing interest on this account. Moreover there will be no less than 6 cars which, though not strictly new, never have been shown in New York—cars from which the bloom of newness was not rubbed off at the late shows of winter and spring this year. The new models which a large number of makers have added to their line, as well as the various improvements which have been made in those previously introduced, will add to the novelty thus created.

Within the year, considerable attention has been drawn to a sturdy little group of makers who are devoting themselves to the production of automobiles of the buggy type. No less than 6 cars answering to this

BENJAMIN BRISCOE
Chairman A. M. C. M. Association

description will be on view, only one of which has been seen in New York before. One or two will be exhibited for the first time at any show, and all will display points of interest and novelty. Naturally they fall into the same general group as the low priced and universally handy runabout of which there will be another half dozen. A round dozen of light vehicles built by as many makers, all listing at $1,000 or under, thus will furnish ample opportunity for investigation of the type.

Continuing the convenient and expressive price classification, there will be a dozen and two or three exhibits in which will be found cars costing upwards of $1,000, but not more than $2,000. A score of makers will stage cars in the $2,001-$3,000 group, and about an equal number, machines ranging in price from $3,001 to $4,000. At least a dozen types of the more impressive sort of car will be staged also, for which, owing either to elaborate body designs, or unusually complete and expensive mechanisms, prices will be asked exceeding the last named figure. The contingent of utility vehicles will display a like variety of cost, the prices ranging from $800 to $6,500, for the types staged.

Plenty of interest centers in the growth of the six-cylinder movement. Fourteen makers will be on hand with sextuple engined machines, two of whom have espoused the six-cylinder cause to the exclusion of all others. Four-cylinder machines will predominate, as heretofore, but twin motors will be strongly in evidence among cars of the lighter and lower priced class, while there will be two or three single cylinder machines, and one three-cylinder—the latter staged by one of the three makers showing two-cycle engines.

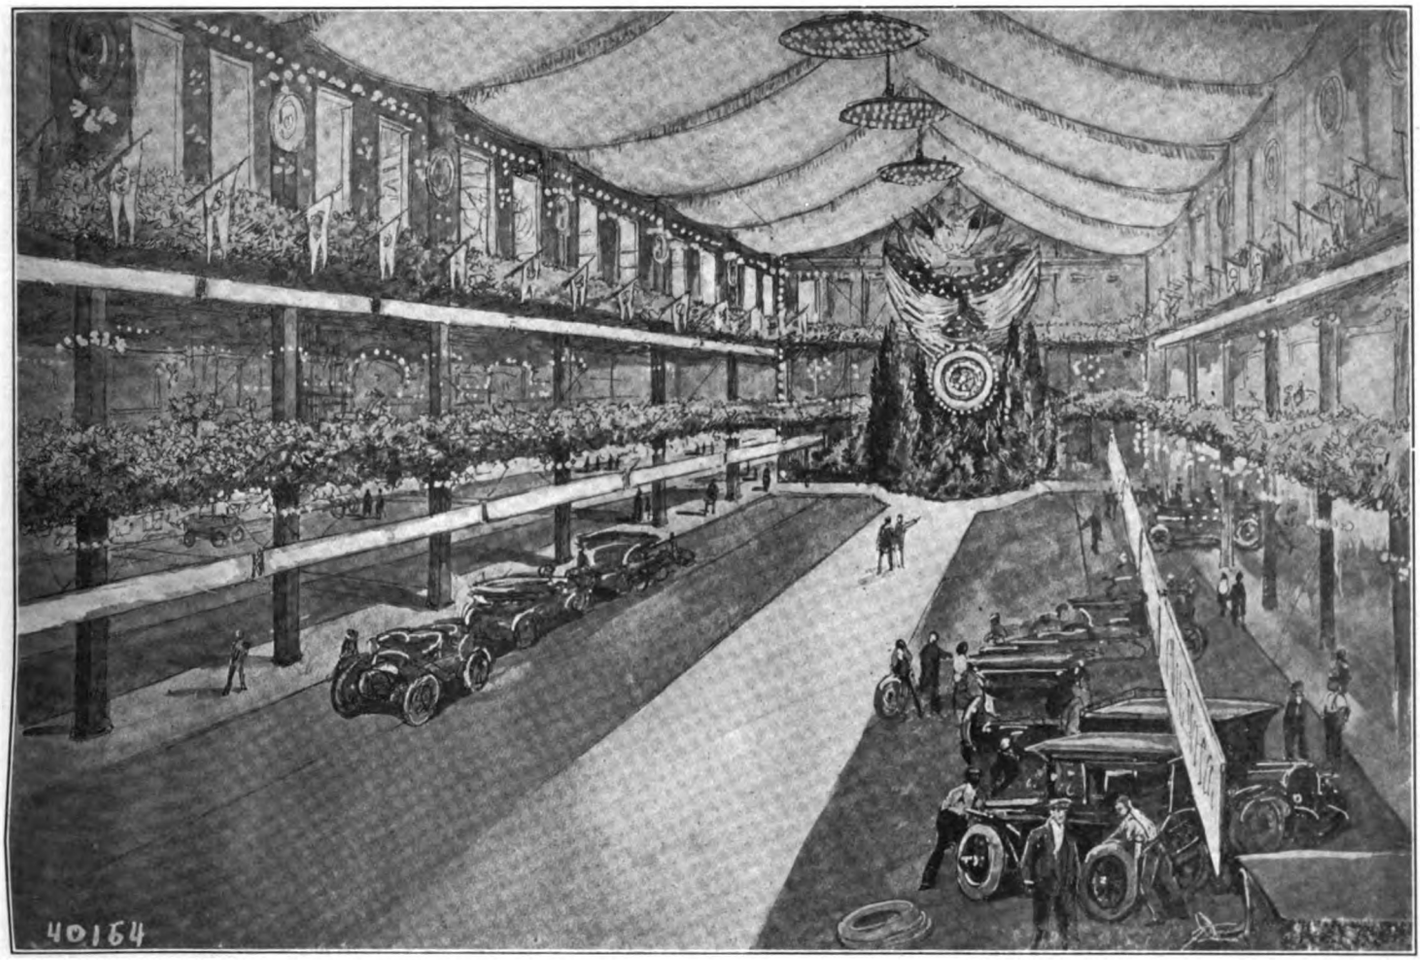
Reading Standard	Ovington F. N.

It is practically certain that the Ford line for 1908, including the $1,000 taxicab, as described in last week's Motor World, will prove as much of a sensation as was furnished a year ago by the appearance of the four-cylinder runabout which since has become so distinguished. Another striking vehicle in the category of the sensational, will be the Brush runabout, seen for the first time at any New York show. Similarly the brand new Maxwell touring car of 26 horsepower, selling at $1,750, will be sure of attracting attention, while the Colt, Marion and York-Pullman runabouts of the six-cylinder sort, each selling at something less than $2,800, are not likely to be ignored by the interested visitor.

Features of noteworthy importance in the cars which are new to the show may be characterized very briefly, as follows: In the Continental is a quadruple braking system which may be actuated individually or collectively, and which acts at once upon the driving shaft at both ends of the change gear, and upon double drums on the rear wheels, large surfaces being utilized in each case; a special form of large diameter multiple disc clutch, having five working members fitted with cork inserts; and special interlocking joints in the steering connection. The Garford, which though absolutely new, is the product of long experience in car building, has a form of rear axle construction which is worth investigating; employs both progressive and selective change gears on its two chassis models, according to duty classification, thus bringing out a novel distinction between the requirements of the operating mechanism in this respect. The double heating of the carburetter, by jacketing and by preheating the air, also is

ALFRED REEVES
Manager A. M. C. M. Association



of interest. Similarly, the "Second Imperial," which is the first of its name to be shown publicly, embodies a special double drop frame construction, which serves to lower the chassis very materially, bringing down the center of gravity, and at the same time permitting the use of a perfectly aligned transmission gear.

The Ellsworth, also a brand new product, is a "special steel" car throughout. Among other things, its ball bearing crank shaft, which is of built-up construction, as well as its conoidal coil master clutch, are both novel and exclusive. The Colt Runabout already has been mentioned. Its light weight construction is an achievement worthy of notice. The Allen-Kingston, while not radical in any way, is yet an all-new car, and in the runabout form, mounts a convertible body seating two, three, or four passengers according to circumstances.

Although not new, the Gearless line, which has not been shown in New York before, possesses a number of special feat-

Digitized by Google

ures, among them a planetary friction change speed gearing, which is best characterized as a toothless planetary system; the four and six cylinder four-cycle types of motor, and the four cylinder two-cycle type, each of which is fitted to one of the three principle cars of the series. The low tension make and break ignition system employed on the Gaeth touring car, as well as its original type of constricting band master clutch, are points which serve to differ-

THE AUTUMNAL SETTING FOR THE SHOW

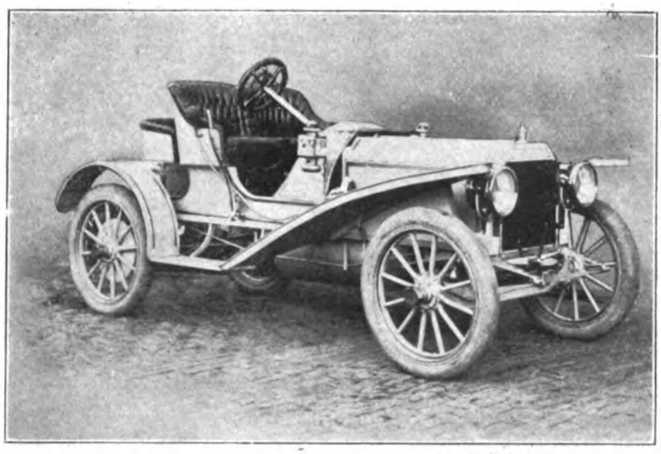
entiate it from many of the other cars on view. The Kisselkar, and the Richmond, both new comers at the Palace, are of the class of light touring cars, each of which presents several points of distinction.

Among the builders of motor buggies, the Holsman Automobile Co., alone has exhibited in the East before. The Holsman cars are driven by a newly designed motor this year, which is of improved form in the matter of suspension in the frame. They also have a new transmission in the form of a protected chain system instead of the simple cable formerly used. The Anderson, Hatfield, Kiblinger, Schacht and Reliable-Dayton lines, all show considerable originality, especially the latter, which has been entirely redesigned, and incorporates a novel form of change gear and counter shaft construction. Under this name also will be shown for the first time a light delivery wagon.

New models added to lines already familiar to the show goer, will be found in many instances, and of these, several will mount six-cylinder engines. This is true of the Mora; both the "Racytype" and "Tourer" answer to this description and are entirely new. They present among other features, a high ratio of power to weight, dust and mud proof mechanisms, double ignition, and annular ball bearings in the engines. The latter are of the same cylinder dimensions as the four cylinder motors of last year and this. A noteworthy feature of Mora, 1908 construction is the use of full platform springs in the rear of the chassis. This is found on the Tourer only, the Racytype model having three-quarter elliptic springs in the rear. The Marion Flyer, also will be shown in six as well as four cylinder form. The makers of the Chadwick Great Six, on the other hand, have permanently abandoned efforts at other types of construction and present the sextuple machine only, but in touring and runabout forms. The chassis is of massive, chain-driven construction, the driving chains being fully enclosed in an aluminum housing, which is exclusive, and unique in several ways.

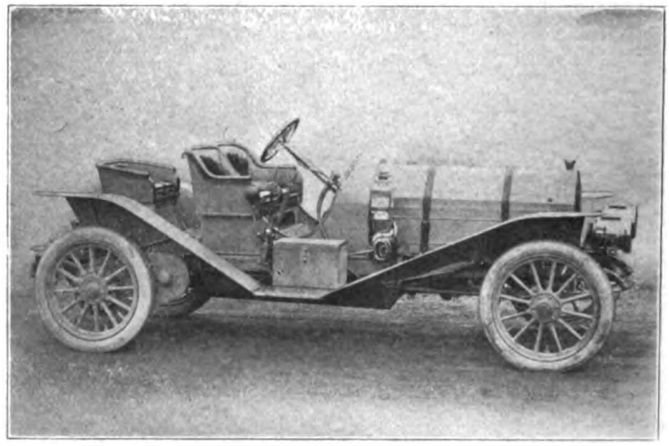
The National line will include two six-cylinder models instead of one, as formerly, Model T, being supplemented by the addition of Model R. The latter has a very compact engine in which, for the sake of space economy among other reasons, but four annular bearings are employed on the crank shaft, instead of seven, as in the larger model. A number of special refinements added to this new motor combine to make it especially free from vibration. A second newcomer in the National group—which incidentally comprises four separate chassis to which various types of body may be applied—is known as Model K, and is a four-cylinder car intended to satisfy the demand for a lower price than is asked for either of the other types. Another machine, which takes on new strength by the addition of both six and four cylinder models, is the York-Pullman. The "4-40" and "6-30" are entirely new, while the Model H car, a 20 horsepower light touring car, replaces a model of somewhat similar characteristics made last year.

New four cylinder models will be still more in evidence than the sixes, however, and among the more noteworthy will be found the new Marmon water-cooled car, which in addition to its motor, is newly designed, and which also is a new departure for its makers, who thus are reaching out



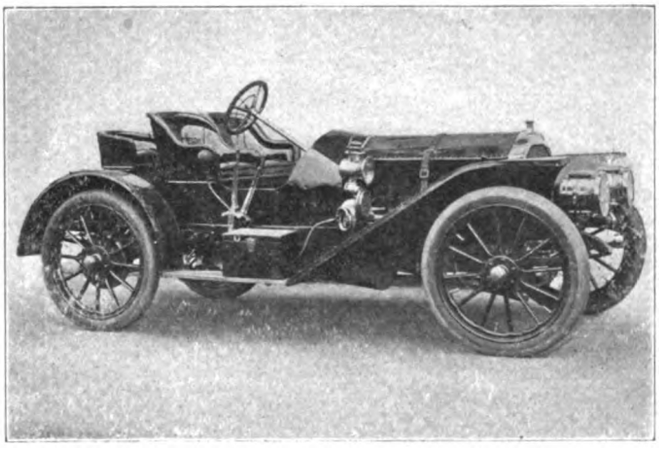
Digitized by Google

from a stable position in the air-cooled realm to increase their hold on the public. The Ford and Maxwell innovations already have been mentioned. The latter comprises a machine possessing all the characterictics of a high priced car, but made to sell at a moderate price. Its features may be summed up thus: Motor, with 4¼ by 4½ inch cylinders, 19 disc clutch; three speed progressive sliding change gear; double-chine also, has its change gear group mounted on the rear axle.

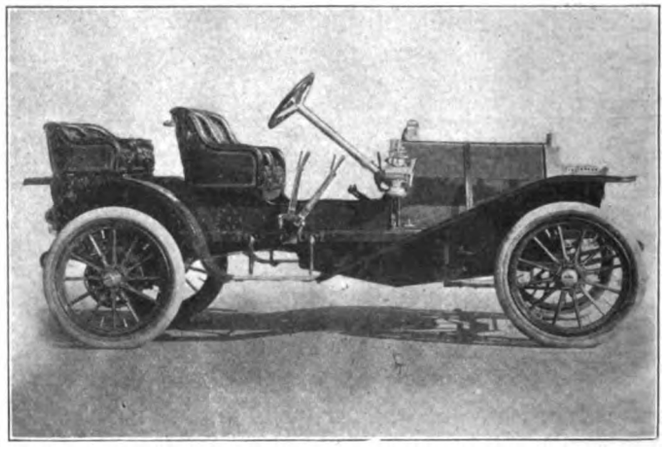


Almost as a matter of course, where makers have not produced runabouts in addition to their touring cars hitherto, they are doing so now. Several new comers are thus to be found which mechanically are close counterparts of well-tried types. The new Reo Model C is a good example of this class. Another is the Great Smith.

their own plant, and has been altered considerably as an incident to the new method of production. The Rainier, which is similarly situated this year, for the first time, has a new motor among other changes in its makeup. The new power plants in these machines do not embody such radical departures from precedent, however, as are found in the case of the Stoddard-Dayton, which now appears with valves mounted in



Four New Models from Old Makers.



GREAT SMITH

CHADWICK

YORK-PULLMAN

MARION

jointed cardan drive; pressed steel frame; semi-elliptical springs; sheet metal body. The thermosyphon cooling system, which is a Maxwell feature, as well as the Maxwell carburetter, of course are in evidence.

The Pennsylvania Model C, which is entirely new at this time, has been described in these columns recently. Its most striking feature perhaps, is the rear axle construction. The moving parts are housed in manganese bronze, the single casting also enclosing the change-gear group, being entirely self-contained and very compact. Another newly designed model is the Wayne Thirty, which supersedes Model N, of last year, and with its runabout equivalent is the only model produced under that standard at the present time. This ma-

Success in the development of the two-cycle line, has encouraged the makers of the Atlas, which up to this time, has been known only as a light runabout, to enlarge upon their product. Accordingly a new three cylinder type has been added, which is in runabout form with rumble seats for two passengers in the rear, in addition to which is a natty light touring car seating five passengers and having a four-cylinder motor. In both of the new cars, the motors possess the same general characteristics as that of the lighter machine, except for the difference in the number of cylinders.

New motors have been adopted by several makers, as for instance, the builders of the Cleveland car, which is now produced at

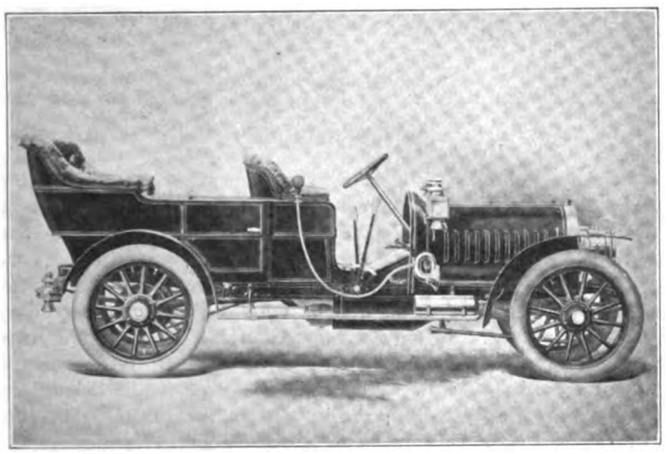
the head, instead of oppositely at the sides of the cylinders, and with a new type of continuous feed lubricating system adapted to very nice regulation. In the case of the Marmon air cooled motor, described recently in the Motor World, the adoption of two-piece cylinders, with the valves seating directly in the removeable heads, whereby a number of gains are made, constitutes one of the most noteworthy motor improvements discoverable.

Generally speaking, however, the changes in motor construction will prove hard to find, though none the less important in so far as the running of the motor is concerned. Thus the Mitchell motors have slightly larger cam shafts than last year, while the width of the cam face also has

Digitized by Google

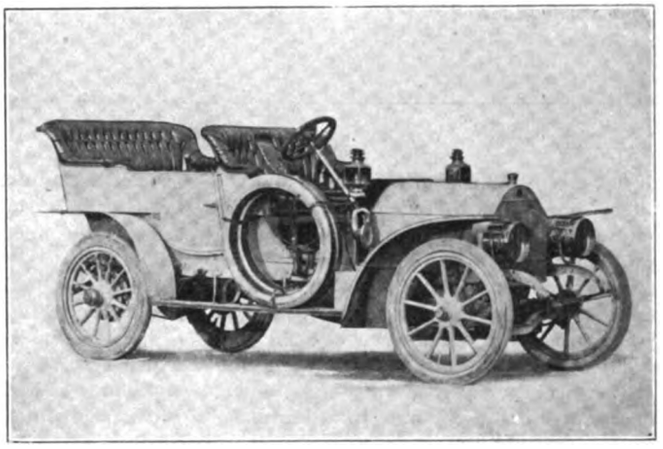
been increased. By enlarging the diameter of the two-to-one gears, it has been found possible to do away with the idle gear formerly employed, incidentally reducing the amount of noise made by the machine to a very considerable extent.

Clutches, generally speaking, reveal small alteration, except, as in the case of the Cleveland and one or two other cars, where the use of the multiple disc has come to supplant the plane cone type. Change gear systems also prove ameanable to less and less alteration as time goes on, it would seem. The Atlas runabout is now equipped with a planetary gear having hardened bearings, and produced entirely in the home shop. In the case of the Great Smith car, roller bearings have been supplied, instead of plain bushings, for the lay shaft. In the Cleveland, a selective gear has been substituted for the former progressive type, its special feature being the use of a fourth speed which is "stepped up" higher than the engine speed.



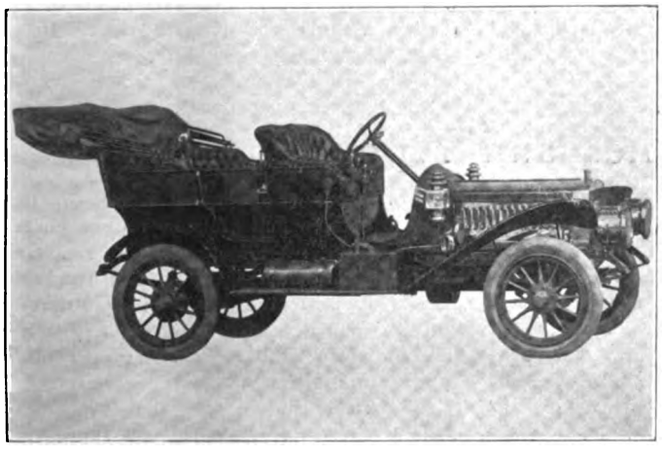
Driving shaft and axle construction is modified in a few instances, as in the case of the Mitchell line, in which the universal joints on the cardan shafts are now completely housed, while the I-beam front axles have been dropped more than formerly in order to permit the lowering of the frame a couple of inches. Occasionally it will be found that the type of the front axle has been changed, as in the case of the Stoddard-Dayton cars, in which the I-beam type is now used exclusively.

A curious example of the tendency to increase wheel sizes is to be found in the case of the Great Smith car. Thirty-four inch wheels are mounted on the touring car which is an improved form of last year's car, while the new runabout has 36-inch wheels. Increases in wheel base are found on numerous cars, frequently including the entire line, or what amounts to the same thing, as in the case of the 1908 Stoddard-Daytons, the Mitchells, which now have 92 and 112-inch bases instead of 90 and 108, as during the present season. The Reo cars are mounted on 32-inch wheels, carrying 3½-inch tires this season, instead of 30 by 3-inch equipments, as heretofore, the result being among other things, a gain of 2 inches in road clearance. A number of cars of the high-grade type, such as the Cleveland and Rainier, already mentioned, are shod with 36-inch tires, instead of the smaller sizes formerly employed.

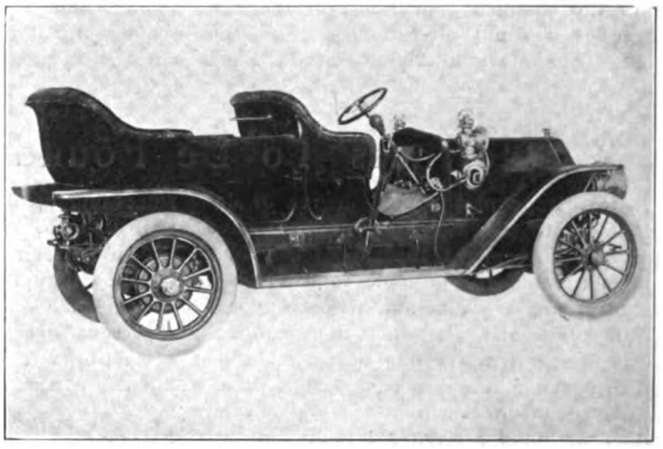


The tendency to increase the braking area of all cars is well illustrated in the case of several of the cars under discussion. The Mitchell touring car, for example, now has 14-inch drums instead of 10½-inch, as hitherto. Also the fact that all the brakes are now mounted on the rear wheels is expressive of a tendency that will be found to be pretty general. In the case of the Reo touring car, added braking strength has been gained by installing an emergency brake on the rear wheels in addition to the equipment previously used. On the Rainier, also, all brakes are now mounted on the rear wheels, working on pressed steel drums instead of castings.

Frequently it will be observed that the motor controlling levers have been removed from their former positions and now appear on the steering wheel, working over sectors of the ratchet type. This is true of the Great Smith, Wayne and Reo cars. Another way in which considerable alteration in the appearance as well as the construction of the machines has been brought about, will be found to lie in the use of im-

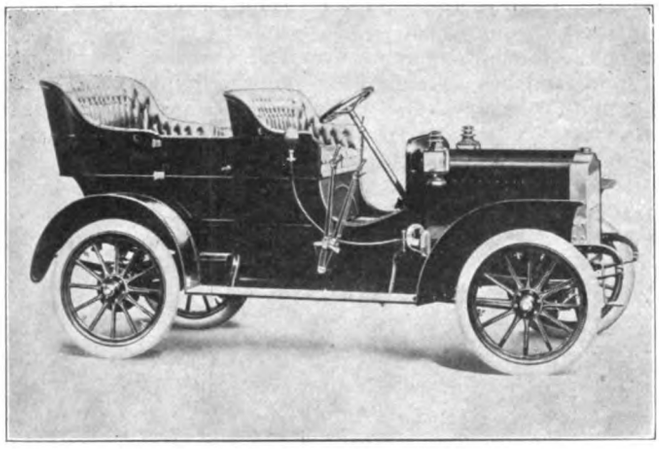


Four of the Big Runabouts that Will Make Their Debuts.

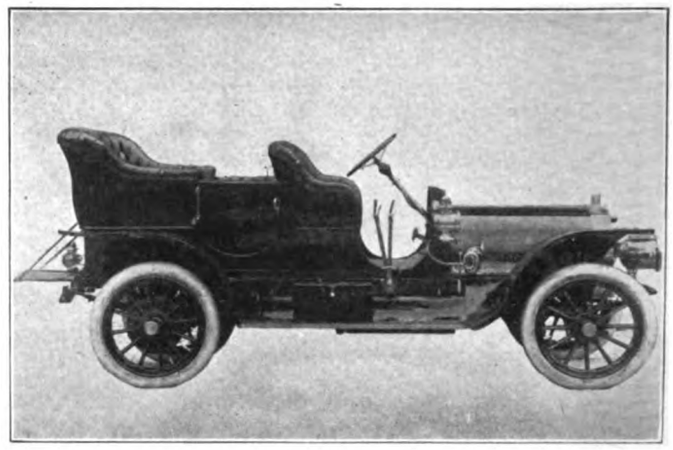


RAINIER

CLEVELAND



MITCHELL



WATER COOLED MARMON

Digitized by Google

THE $1750 MAXWELL

THE $3500 NATIONAL

proved types of mud guards. These and the running boards now receive considerable attention from the designer, and with profit, Changes which will be remarked in this respect, apply to the Maxwell, Wayne, Reo, and Moline lines. Further improvement in the appearance of the Moline two-cylinder car having been secured by the adoption of an entirely new type of hood, which, with the new body, combine to alter its aspect very materially.

Changes in body design are difficult to describe, but nevertheless, contribute greatly to the changed appearance of the car, where even slight alterations have been made. The Marmon, Great Smith, and Stoddard-Dayton, bodies, for instance, have been made more comfortable by the lowering of the tonneau seats. Others have been similarly altered. A new departure in the way of electives offered to the prospective purchaser, is that presented by the makers of the National car, the various types of which may be had with either cast or sheet aluminum bodies. The variety of this comprehensive line is still further extended by the option of two types of radiator and hood, namely the familiar "round radiator" which has become so well known to the public, and a new rectangular pattern, which, with its hood, presents a very novel as well as pleasing appearance.

For the first time, the names Rambler and American Berliet will be missing from the Palace show. In both cases the inadequacy of the show space allotments received by the respective makers, accounts for the hiatus which cannot fail to be remarked. The American Locomotive Automobile Co., and Thomas B. Jeffery & Co., however, have no lack of "show spirit," and consequently will hold exhibitions of their own during show week. The Berliet cars will be on view at the Waldorf-Astoria hotel, and the new Rambler line in its entirety will be displayed in the warerooms of Homan & Schulz, the New York agents, at 38-40 West Sixty-second street.

Newness To Be Found In Tires and Appurtenances

Notwithstanding the high degree of development to which automobile tires have already been brought, thus apparently limiting the room for possible improvement, the surprising array of new tires to appear at the Show indicates that the manufacturers are far from resting on their laurels and are giving every encouragement to inventive genius. Special tires for special service are also receiving a degree of attention heretofore unthought of, but bearing evidence of the diligent co-operation of the tire manufacturers in making the automobile a perfect vehicle. While considerable daring of design is shown in the new offerings, the experience and reputation of the firm whose names they bear is an assurance that the new products do not belong to the freak classes of earlier days, but represent true advance in the art. They also make it evident that the industry has not reached a stage of smug self-satisfaction which would be calculated to discourage progress toward perfection.

The Firestone Tire & Rubber Co., of Akron, O., will disclose the 1908 Firestone dual, non-skid tread for pneumatic tires, which by its ingenious construction is calculated to afford protection against skidding. The 1908 Firestone dismountable rim will likewise be shown; the company also has something up its sleeve, which may be revealed during the week. A new "cellular" tire and a self-healing pneumatic tire will be shown by the Swinehart Clincher Tire & Rubber Co., of Akron. Both of these represent decided departures from usual tire design. The new Motz non-skid cushion tire of the Motz Clincher Tire & Rubber Co., Akron, will make its first show appearance.

By reason of the fact that an American plant for the manufacture of Michelin tires has been started at Milltown, N. J., considerable interest attaches to the 1908 product offered by the Michelin Tire Co., of which, first and foremost will be the new "compressed tread" clincher type tire, exhibited for the first time in America. The design of this tire is such as to compress the tread from the two sides, so that if the tread be scarred or cut the action of the air pressure will be to close the wound rather than to open it with pressure from behind. Sections of the new tire are shown and the action of the air pressure in compressing instead of expanding the tread, is explained.

The exhibit of the Diamond Rubber Co., of Akron, in addition to showing the "stand pat" wrapped tread products and the Marsh quick acting clincher rim, will also contain the new Diamond "Electric" tire, a special tire of great resiliency for use on light electric cars, which aims to reduce current consumption by absorbing the resistance offered by obstacles or uneven road surfaces. A perfected form of demountable rim also will be shown together with a new line of white rubber solid tires for buggy type automobiles.

Ajax tires, shown by the Ajax-Grieb Rubber Co., of New York, will represent a different method of building from last year, wrapped tread construction being used, while Morgan & Wright, of Detroit, will have a new quick detachable clincher tire, as has the Hartford Rubber Works Co., of Hartford. Both these concerns exhibit the new Midgley rim, which has been so thoroughly exploited by advertising as already to seem old, although it is but making its first appearance at a show. The rim is also demonstrated at the booth of the Midgley Mfg. Co., Columbus, O., its makers. Another new rim to make its bow is the Parker rim, invented by Orrel A. Parker, president of the Newmastic Tire Co., of New York, in whose space it will be shown. The outer half is removable and the distance between the clinchers may be varied. It was originally designed to expedite the application of tires filled with Newmastic compound instead of air, but will be offered for

Digitized by Google

regular clincher tires as well. Complete Newmastic-filled single tube tires also will be presented for sale. Leather tubes and metal armored casings of new design will be exhibited for the first time by the Leather Tire Goods Co., of Newton Upper Falls, Mass. The J. H. Sager Co., of Rochester, N. Y., branches out from the equalizing spring field to include the manufacture of something new in tire grips. The electric vulcanizers of the C. A. Shaler Co., of Waupun, Wis., will have several additions to the line, including a new large model and a special valve stem vulcanizer, designed for use on tires having rubber valve stems.

Developments in Accessories and Parts

New things have a special claim for attention because they constitute one of the chief grounds for holding a show and are what the average person wants to know about. It follows that in the 190 exhibits of parts and accessories much that is new and interesting will be found. For not only is that field still fertile with ingenuity and invention, but it more readily lends itself to show demonstrations, of which full advantage will be taken by not a few exhibitors. In addition to well informed salesmen and demonstrators, the performance given for the entertainment and edification of the visitor includes the appearance of a knight in full armor, a hive of bees, the pleasant smiles of Hebe White—a young lady who is in rivalry with Phoebe Snow for keeping clean on long tours, several Teddy bears, workmen making batteries, miniature automobiles on a rolling roadway, flashing electrical displays, a school day blackboard, and demonstration devices that convey a lesson to the most uninitiated in matters mechanical.

Speed indicators with new names are not so numerous as at former shows, the majority of those shown being devices already known to the public, but with such detail improvements as the past season has shown to be possible. An entirely new instrument of this class, however, will be shown by the Jones Speedometer Co., of New York, in what is termed an automatic speed control governor. It makes it possible for the man in the tonneau or limousine of a car to prevent the chauffeur or driver from exceeding any predetermined maximum rate of speed, by simply setting the lever, after which the instruments works automatically. If the chauffeur is driving alone, he may set the instrument himself and be sure that he will not go over whatever maximum the device is arranged to permit. A new Jones speedometer at the low price of $25, complete with season mileage odometer, and known as Model 22, is a mild sensation offered by the same company to supplement the several more expensive models. Another speed instrument which makes its first appearance at the Show is the Phelps vehicle recorder, which will be exhibited by Wm. S. Jones, of Philadelphia. The recorder keeps a graphic record of speed, mileage and duration of stops and may be applied to almost any sort of vehicle.

An optical demonstration of the efficacy of shock absorbers will be given by the Hartford Suspension Co., of New York, by means of two small motor cars on a moving roadway, one without shock absorbers and the other equipped with them. The road is very rough and the workings of the demonstration will give a very convincing idea of the effect of shock absorbers in smoothing out ordinary road shocks. The Hartford-Truffault shock absorbers have a new feature for 1908 in a dial arrangement which enables the user to determine the proper friction tension for whatever car to which they may be applied, and to make the tension correct for all four devices in a set. The Hotchkin Mfg. Co., of Chicago, will offer a new model of the Hotchkin anti-jolt device and will enlist the services of a Teddy bear in showing its virtues, little Bruin being subjected to many severe bumps when the device is taken off ,but having a comfortable time when it is on. The new model of the Diezemann shock absorber will be displayed by the Diezemann Shock Absorber Co., of Hoboken, N. J. While the same in principle as previous models, it is quite different in form, its various new features being explained with the assistance of unassembled parts.

Ignition has received a great deal of attention and a variety of new and improved devices will be in evidence. The Splitdorf Laboratory, of New York, will feature a synchronized distributing coil, which while using an individual coil unit for each cylinder, is designed to give perfect and uniform timing throughout a multi-cylinder motor. What is described by the K-W Ignition Co., of Cleveland, as an "entirely new ignition system" is shown by that concern, together with the new, improved K-W plug and a new line of engine speed magnetos. Importations from Europe in the magneto line that are radically new, constitute the exhibit of Lavalette & Co., of New York.

Simplicity is the feature of a new high tension magneto which will be presented by the Remy Electric Co., of Anderson, Ind., in which no coil is used and only one shaft. New types of timers, distributors and magneto switches will be staged by the Connecticut Telephone & Electric Co., of Meriden, Conn., together with a new dial adjusting screw on coils, by which the coils may be adjusted without the use of an indicator, while the Witherbee Igniter Co., of New York will blossom out with a full line of ignition specialties bearing the name "Wico" and including a departure in the roller type of timers, which by the employment of a loose ring gives large contact surfaces. Plug switches and spark plugs also will be shown, together with the new coils equipped with porcelain tops and having special accessibility features. A "human interest" exhibit in the booth will be a bee hive in the form of a Witherbee battery and filled with live honey bees, to impress the "with-a-bee" name. Those who like to see how dry cells are made will have only to watch the workmen in the exhibit of the Crown Battery Co., of New York, where Crown batteries are shown to the automobile trade for the first time. Geiszler Brothers, of New York, claim high non-sulphation qualities for the new accumulators which they show.

For the first time the much discussed feature of variable shading of the light from acetylene lamps takes concrete form in an exhibit at an American show. The Badger Brass Mfg. Co., of Kenosha, Wis., and New York City, will exploit the Solar lamps equipped with the Besnard shutter system, by means of which the blinding glare from the headlights may be toned down as much as desired in an instant, from the seat. Several new lamps also will be shown by other exhibitors, but the majority of these are detail alterations in style.

The parts makers will have new things to show, too. In exhibiting at this time they will hope to make converts before the actual rush of manufacturing commences and to have their products impressed upon the minds of the designers in case new models are later brought out. The Timken Roller Bearing Axle Co., of Canton, O., will present a front axle with Timken roller bearings in the knuckle head, for which many virtues are claimed. The axle is of the I beam type and is for use on pleasure cars up to 3,400 pounds. The same company will also show a rear axle embodying the new Hedgeland equalizer in its newest form of application, thus doing away with the usual differential gearing. New forms of Timken hubs for heavy trucking will also be shown. The American & British Mfg. Co., Bridgeport, Conn., plans to exhibit the famous Herreshoff 40 horsepower "1908" motor designed like the power plant of the record breaking racing boat "Den" but which is suitable for motor cars. In chains there are to be obvious improvements shown. The Diamond Chain & Mfg. Co., of Indianapolis, Ind., will present two new styles of chain. The first will be distinguished by the use of chrome nickel steel for the side bars, which will make it possible to use side bars scarcely half as heavy as those ordinarily used and thus lightening the whole chain considerably. The second of the new styles that will make their initial bow will be a "built-up" block chain, similar in ap-

Digitized by Google

pearance to a roller chain, but with hardened steel bushings on the rivets to take the place of the rollers. The Whitney Mfg. Co., Hartford, Conn., will also show driving chains for 1908 made by improved processes, now possible because of an immense new factory. To make plain to everybody the advantages of a new bearing containing two rows of balls, the New Departure Mfg. Co., of Bristol, Conn., intends to install a testing machine which will subject the bearing in question to severe radial load and end thrust tests. Both the practical and theoretical advantages of the new type of bearing will be given complete exposition. Inexpensive tank gages and a line of brass specialties will be among the new things to be exhibited by the Hancock Mfg. Co., of Charlotte, Mich. The Gemmer Manufacturing Co., of Detroit, Mich., will offer a new ball bearing gear system, in addition to improved forms of previous types. The Worcester Pressed Steel Co., will have no demonstrators or salesmen in charge of its exhibits but will depend upon specimens of "autogenous welding," displayed in cabinets, to call attention to its work. Oxygen and acetylene are used in a blow pipe flame for this new process, and interesting results will be shown.

The latest model of Columbia lock nuts will interest the mechanically inclined visitor at the exhibit of the Columbia Nut & Bolt Co., of Bridgeport, Conn. Manufacturers and garage repairmen will be appealed to at the exhibit of the Clover Mfg. Co., of New York, The concern will demonstrate the rapidity with which cylinders and bearings may be ground by the use of Clover compound, a new preparation for automobile use. A novelty in the way of a tubular steel automobile steering wheel will be shown by the Standard Welding Co., of Cleveland, in addition to its regular exhibits. The wheel will be copper plated, galvanized, nickel plated and buffed. The Hill Mfg. Co., Buffalo, N. Y., is making plans to exhibit a new, revolving auxiliary chair seat which will have fold-up qualities and compactness to recommend it. The company also intends to show an entirely new wind shield, which while folding over and having the glass in two pieces, will have no frame in the middle of the glass which might obstruct the view. The edges will match so closely as to make the shield like one piece.

The knight in full armor will preside at the booth of the Travelers Insurance Co., of Hartford, Conn., his habiliment standing as a symbol of the protection afforded by an insurance policy Miss Hebe White, the keep-clean girl, is subsidized by a non-fluid oil concern, and will hand out a booklet of her experiences on a long automobile tour.

Free education in automobile matters will be offered in tabloid doses to visitors at the exhibit of the New York School of Automobile Engineers. If any one be confused as to the difference between a planetary and a sliding gear transmission, a torsion and a strut rod, high tension or low tension ignition, or between a cardan and a universal joint, all he has to do is to go to the School space and have it explained to him. In fact the school proposes to maintain a free information bureau for the public, to go into the mysteries of two-cycle and four-cycle motors, or progressive and selective change gears and to make clear anything that may puzzle the non-technical. To assist in this worthy cause a vast array of apparatus will be installed. The exhibit will contain among other things a four cylinder, four cycle motor thoroughly sectionalized and equipped with a sectionalized carburetter and muffler and arranged for the attachment of high tension ignition by four coils and a timer, by one coil and a distributor, and by high tension magneto. With this engine demonstrations will be given in valve setting, ignition wiring, carburetter adjustment and engine faults. The exhibit will also include transmissions, a sectionalized rear axle showing shaft drive arrangement, apparatus illustrating steering principles, sectionalized spur and bevel gears, a dismounted differential, secondary coils, make and break ignition outfits and a library of charts, together with a blackboard. The exhibit will be in charge of men who agree to answer any technical questions, a promise so rash as to be startling in its nature.

The Village Blacksmith.

Under the spreading chestnut tree
The village smithy stands,
The smith, a mighty man is he . . .

——Now prepared to meet demands
For prompt repairs to auto cranks,
Magnetos, sparkers, chains, hoods, tanks;
New parts for every known machine;
Full stock oil, graphite, carbide, gasoline—

. . . . And the muscles on his brawny arms
Are strong as iron bands.

His hair is crisp, and black, and long,
His face is like the tan;
His brow is wet with honest sweat,
He earns whate'er he can . . .

—Vulcanizing, riveting, brazing, repairing
Of radiator, clutch, cylinder, bearing;
Inner tubes for sale, cement, patches, tires,
Battery cells, spark-plugs, coils, wires—

. . . And looks the whole world in the face,
For he owes not any man.

Toiling—rejoicing—sorrowing,
Onward through life he goes;
Each morning sees some task begun,
Each evening sees it close . . .

—Tires recovered, relined, retreaded; sectional and tube patching; aluminum brazing; repairs to radiators, mud-guards, sprocket-cones; overhauling and adjustment of every description; on hand day, night and Sundays (residence, third house to right, behind school house); prices reasonable; all work guaranteed; patronage of automobile resp. invited—

. . . Something attempted, something done,
Has earned a night's repose.

—Life.

CLOSE RUN FOR KNIGHT TROPHY

Hoffman Again First in Chicago Economy Contest—Much Arithmetic Required to Determine Results.

For the third consecutive time Harry Paulman's Pierce Arrow car has been returned a winner in a Chicago economy test. Its latest laurel wreath was won in the 200 miles economy test for the Knight trophy which was decided in the Windy City last Friday, 18th inst. The contest was one in which, as the results abundantly demonstrated, practically every drop counted.

Paul Hoffman drove the Pierce but his victory was not by such a large margin as to leave a chance for much hurrahing. Not that the victory was not deserved or anything like that. Far from it, for G. H. Bird's Corbin car disputed the victory brilliantly, losing first place by only .075 percentage. If the battle for first was close, so was the fight for third, fourth and fifth places, in which the Apperson, Berliet and Silent Knight figured, and the technical committee was forced to run its summary into three decimals before it could arrive at the result.

This economy contest was for the Knight trophy and was open to the first ten cars that finished in the Chicago Motor Club's Chicago-Valparaiso economy contest in September, which Hoffman won. The course was from Chicago to New Carlisle, Ind., and return via Michigan City, a distance of 200 miles, and although the old formula of dividing the weight of the car by the weight of the gasolene consumed was employed, the committee had evolved a weight allotment, that was designed to make it more of a motor efficiency contest than an economy test. Each car had to carry 13½ pounds of weight for each cubic inch of piston displacement.

Thursday afternoon special tanks containing 15 gallons of gasolene were attached to the front seats of the contending cars, the tanks were filled and the cars put under lock and key in a garage and also under the surveillance of two Pinkerton detectives, to guard against tampering during the night.

Despite the early hour of 6 o'clock, all the contestants were ready for the start a few minutes after that time. Hoffman was the lucky drawer and started first after the Ford pilot car. The order of start of the other contestants was: C. W. Birchwood, Haynes; C. A. Tilt, Diamond T.; W. W. Shaw, Berliet; A. J. Banta, Locomobile; C. Y. Knight, Silent Knight; G. H. Bird, Corbin; J. Buchanon, Berliet, and Edgar Apperson, Apperson.

The run to New Carlisle was uneventful, the pilot car reaching there first, followed by A. J. Banta in the Locomobile. There was a long wait for the others who ran well within the legal speed limits. On the way back there was one accident that threatened to prove serious. Two women were driving along the road in a buggy and when they saw the press car bearing down upon them one of them jumped out directly in front of the car. To avoid running over the woman Donald Kilbourne, who was driving, had to turn quickly and in so doing bumped against the carriage, which was overturned. The other woman was thrown out and bruised some, but both were driven to their homes in the automobile, as their horse had taken fright and made tracks for home.

The first car to finish at Chicago back of the pilot car was the Locomobile, manned by Banta, and after all had checked in the technical committee got out their arithmetics and two or three reams of paper and set in to work. After several hours they announced that the Corbin had won, and on the strength of that announcement, the Corbin adherents treated the crowd. Then the committee located some more figures to prove how it happened and discovered that it didn't. Somebody had mislaid five-sixth of an eon of gas, and this added to the floating decimal divided by the vibration of the general opinion subtracted the Corbin from the headlines. There was not any dispute, as the victory was so close that a second's evaporation of gasolene on either side would have changed the result. The Pierce Arrow, which weighed 5,832 pounds, consumed 12 gallons 15.6 ounces, and its percentage was 1.875. The Corbin, weighing 3,649 pounds, used 7 gallons 3 quarts 17 ounces; its percentage was 1.8.

So close was the fight for third place that the numerical jugglers had to move the decimal point several places before they could swear to the answer. The Apperson had 1.647 and the Berliet, driven by Shaw, 1.637. The Silent Knight was next with a score of 1.54. The complete summary of this unusual and hard fought contest follows:

Pos.	Driver.	Car.	Weight.	Fuel Consumption. Gal.	Qts.	Oz.	Percentage.
1	Paul Hoffman,	Pierce Arrow	5,832	12	0	15.6	1.875
2	G. H. Bird,	Corbin	3,649	7	3	17	1.8
3	Edgar Apperson,	Apperson	6,412	15	0	26.5	1.647
4	Waldon W. Shaw,	Berliet	3,123	7	1	25.5	1.637
5	C. Y. Knight,	Silent Knight	4,723	11	3	23.5	1.54
6	C. A. Tilt,	Diamond T	4,784	13	0	15.25	1.425
7	C. Birchwood,	Haynes	3,830	10	2	4.5	1.42
8	James Buchanan,	Berliet	3,123	9	0	15	1.33
9	A. J. Banta,	Locomobile	2,683	12	1	17	0.848

FARMERS FOUGHT HILL CLIMBERS

Rochester's Twice Postponed Contest Attended by Rustic Violence—Talbot Makes Best Time of the Day.

Twice postponed on account of unfavorable weather the annual hill climb of the Rochester Automobile Club, held on the Penfield dugway, near that city last Saturday afternoon, 19th inst., was a success despite the hostile manifestation of neighboring farmers. Several thousand spectators were attracted to the hill, but the meet was not appreciated by the farmers, and because of agrarian anger, there were several lively scrimmages and exasperating delays.

The fastest time of the day was made in the free-for-all gasolene touring cars, which was won by Charles Talbot, driving a Franklin, who climbed the hill in 48 seconds. The summary:

Gasolene Runabouts Costing $1,000 or Less.

Fred E. Mason, Ford	1:22⅗
Blank, Cadillac	1:47⅖
J. W. Cook, Ford	1:57

Gasolene Runabouts Costing $1,000 to $2,000.

Blank, Stoddard-Dayton	1:08

MICHELIN

FRANCE
ITALY
ENGLAND
AMERICA

No more Duty—no more trans-Atlantic Transportation Charges on MICHELIN Tires. Manufacturers can now afford to equip their cars with MICHELINS. What kind of an excuse can be given by the agents of the manufacturer who can, but does not?

The car-buying public KNOWS that MICHELIN Tires are the world's standard—are by far the most durable, serviceable, most economical that money can buy. The car buyers want the BEST—manufacturers can now afford to give it to them.

The manufacturer who DOES equip his 1908 cars with MICHELIN Tires thereby gives to the public an unmistakable demonstration, a convincing proof, that he is determined to make his product the best in its class in EVERY particular. He gives his agents the strongest possible selling argument for the new year.

A large number of America's highest-priced cars will use MICHELIN Tires. They will be the standard catalogued equipment of leading cars in other classes. Agents who sell these cars will find that MICHELIN Tires are a tremendously powerful selling aid. Customers who buy these cars will find MICHELINS a great saving in tire cost in the course of a year.

The high import duty and heavy transportation charges on MICHELIN Tires have been eliminated through the erection of our great American MICHELIN factory. The tires made here are identical with the output of our other factories in France, England and Italy—the world-famous MICHELINS that have been used on the winning cars in all the world's greatest races for the last six years and which made their victories possible.

Exhibiting at Grand Central Palace, Gallery Space 129.
Exhibiting at Madison Square Garden, Basement Space 209.
Exhibiting at Chicago Coliseum, Annex Spaces 102 and 103.

CLINCHER TYPE.
Round, Flat and Anti-Skid.
American and Millimeter Sizes.

QUICK DETACHABLE TYPE.
Round and Anti-Skid.
American Sizes only.

All the above can be used on any of the well-known Quick Detachable Rims.

GOOD RACING AT KANSAS CITY

Derby Day Crowd at the Sixth Annual Meet—Chandler Captures Four of the Chief Events.

A record breaking crowd of 6,500 persons attended the sixth annual race meet of the Automobile Club, Kansas City, at the Elm Ridge track, near that city, on Saturday afternoon last, 19th inst. Although no records were broken, fast time was the order of the day. Joseph Chandler made a "killing," winning four firsts. Not since the memorable jockey club meetings had Elm Ridge presented such an animated appearance. It was like Derby day. Before the first event was called every seat in the grandstand was occupied, the porches of the club house were crowded, the center field was crowded with automobiles and their occupants, while the fences were lined with spectators.

Chandler, driving a six-cylinder Stevens-Duryea, started his winning streak in the first event—a fifty miles endurance derby for stock cars. Nine cars started in the event and after the weeding out process began Chandler assumed a position in front, which he relinquished but once, then on account of a punctured tire. He finished first in 1 hour 10 minutes, a Mitchell being second with 47 miles.

Chandler brought his car to the front in the five miles for fully equipped touring cars costing $3,000 and over, in 5:59; the ten miles free-for-all for the Board of Trade's cup, in 11:35½, and the five miles match for fully equipped touring cars.

Honors in the other events were fairly well distributed, drivers of Stoddard Dayton cars winning both five mile runabout races; the Ford won two events and the Buick one. An exhibition mile by "Whistling Billy" White was covered in 1:05, and John Vogel finished first in the five miles for motorcycles. The summaries:

Fifty miles endurance derby, for fully equipped touring cars—Won by Joseph Chandler, Stevens-Duryea; second, Mitchell, 47 miles; third, Stevens-Duryea, 46 miles. Time, 1:20.

Three miles for fully equipped runabouts, costing $1,000 and under—Won by Ford; second, Mitchell; third, Maxwell. Time, 4:33.

Five miles for fully equipped runabouts costing between $1,000 and $2,000—Won by Stoddard-Dayton; second, Stoddard-Dayton; third, Jackson. Time, 7:42.

Five miles for fully equipped runabouts costing between $2,000 and $4,000—Won by Stoddard-Dayton; second, Moon; third, Oldsmobile. Time, 6:21½.

Five miles for fully equipped touring cars costing $2,000 and under—Won by Buick; second, Cadillac; third, Jackson. Time, 7:22.

Five miles for fully equipped touring cars costing between $2,000 and $4,000—Won by Ford; second, Stoddard-Dayton; third, Stevens-Duryea. Time, 6:28.

Five miles for fully equipped touring cars costing over $3,000—Won by J. Chandler; Stevens-Duryea; second, White. Time, 5:59.

One mile exhibition—By White racer. Time, 1:05.

Ten miles free-for-all, for Board of Trade cup—Won by J. Chandler, Stevens-Duryea; second, Oldsmobile; third, Ford. Time, 11:35½.

One mile high gear race—Stevens-Duryea made fastest time and Ford slowest time. Award withheld pending protest.

Five mile match for fully equipped touring cars—Won by J. Chandler, Stevens Duryea; second, Stoddard-Dayton. Time, 6:32.

Atlantans See a Strang Fast Mile.

As the meet was unsanctioned, and further than that was promoted by William H. Pickens, who has been suspended for his connection with the lamented Brighton Beach meet, it is likely that those who competed at Atlanta, Ga., Monday of last week, 14th inst., will receive a dose of American Automobile Association medicine in the form of suspension, that is, if the controlling body acts in accordance with its rules. Those who competed at the Atlanta meet are Louis C. Strang, New York City; John H. Bryant, Ernest Jones and W. L. Gilbert, of Atlanta.

That there are some 5,000 people in Atlanta and its environs who do not care how recklessly they squander their money was brought out by the "meet." The word "meet" is used grudgingly, for besides Strang's exhibition and a challenge match race between two local cars, there was nothing else to it.

Notwithstanding, there were about 5,000 people who readily thought they had their money's worth. This would be surprising but for the fact that the meet(?) was held in connection with the annual State fair, where every one who goes expects to get buncoed.

Piedmont track is a half mile affair and it was in very bad shape when Strang pushed his uncle's racing car on it for a mile record trial. Numerous horse races had the effect of making the surface unusually dusty, and after Strang circled it once preparatory to a flying start it was worse. Christie's young understudy made two laps in 1:16, and as this was three seconds faster than Barney Oldfield had done last year, the crowd proclaimed Strang a hero.

The only other race was a five mile challenge between the owners of a Ford and a Pope-Hartford. John H. Bryant drove the Ford and Ernest Jones and W. L. Gilbert sat in the other car. Bryant got the better of the start and lead until the finish, covering the distance in 8 minutes 6¼ seconds.

OLDFIELD AND SAVIN AT MEMPHIS

Barney Wins "Two Miles Sweepstakes for Purse of $1,000"—Local Riders in Well Contested Races.

For competing in Barney Oldfield's and Ollie Savin's race meet at Memphis, Tenn., on Saturday last, 19th. inst., a number of Memphis drivers made themselves liable to suspension by the American Automobile Association, for competing at an unsanctioned race meet. Oldfield and Savin already are under investigation for having promoted and competed in unsanctioned meets.

A crowd numbering 3,000 gathered at the Montgomery park track to witness the meet, which it might be added, was not so much on the hippodrome order as some other meets that Oldfield has had the promoting of. Several races for local drivers were provided and they all were spirited and well contested.

Tragedy came near lingering in the wake of the meet. Tim Green, a negro helper, employed by Roy Willener, was hanging on the steps of a White in the last lap of the two mile race. Jack Carey, in a Buick car was leading at the half mile. He ran a little wide and Willener attempted to go through on the pole. The Buick then swerved toward the inside rail, and Willener had to take his choice of running into the car or the fence. He chose the latter and a piece of scantling pierced the fleshy part of the negro's leg as the car ploughed through the fence. The boy was brushed off. Suffering great agony he was taken to a hospital ,where it was said there is a chance to save his leg if blood poison does not set in.

Oldfield drove several exhibitions, his best being a mile in 1:07. The summary of events follows:

Three miles for cars costing less than $2,000—Won by Jack Carey, Buick; second, Williams, Buick; third, Roy Willener, White. Time, 4:35.

Two miles for cars costing $3,000 or less—Won by Butler, Ford; second, McDonald, Rambler. Time, 3:55.

Two miles free-for-all stock cars—Won by J. W. Myers, Pope-Toledo; second, Butler Ford. Time, 3:35.

Five miles novelty—Won by J. W. Myers, Pope-Toledo; second, Barney Oldfield.

Two mile exhibition—By Ollie Savin. Time by miles, 1:08⅘, 2:18.

Two mile exhibition—By Barney Oldfield. Time by miles, 1:07, 2:15.

Three miles free-for-all handicap—Won by Ollie Savin (scratch); second, J. W. Myers, Pope-Toledo (0:20); third, Williams, Buick (1:30). Time, 4:14⅘.

Two miles sweepstakes for "purse of $1,000"—Won by Barney Oldfield; second, Ollie Savin. Time, 2:39⅘.

In the Retail World.

W. B. Bennett is erecting a garage at 651 Clarkson street, Denver, Col. The structure,of brick, will cost $8,000.

Robert Smith, Rockford, Ill., moved into his new garage in Eighteenth street this week.

The Clifton Garage & Livery Co. will erect a commodious garage on Howell avenue, Clifton, Ohio. The estimated cost will be $50,000.

The Utica Motor Car Co., which has the agency for the Pierce Arrow in Utica, has opened a branch in Syracuse. A. A. Lederman will be in charge.

Judge Holt has granted a discharge in banqruptcy to Albert H. Funke, who dealt in automobile supplies and sporting goods at 83 Chambers street, New York City. His liabilities were $102,338.

A. E. Morrison has joined partnership with A. J. Price, and the firm will handle the Rainier in Boston vicinity. Morrison & Price, as the firm will be styled, will be located at 169 Huntingdon avenue.

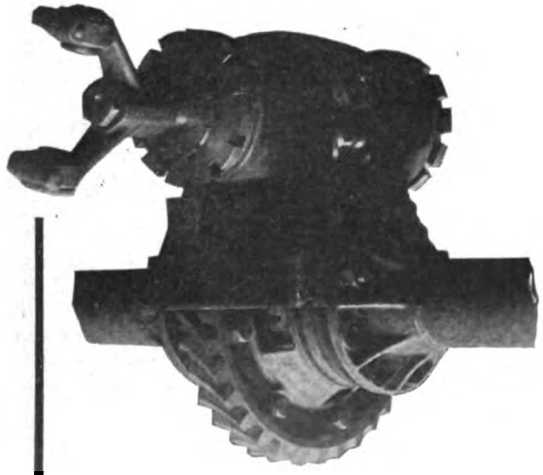
The building on South Madison avenue, Peoria, Ill., now occupied by William Turnbull as a garage will be torn down to make room for a new garage. It will measure 52 x165 feet and have entrances on two streets.

The Borderwisch & Glancy Automobile Co., which maintains a garage on North Jefferson street, Dayton, Ohio, has been changed to the Bordenwisch Automobile Co. Since the death of E. M. Glancy, Edward Borderwisch has bought the entire niterest of the firm.

The Star Motor Co., has opened a garage at 222 Halsey street, Newark, N. J. Lester B. Harris is president of the new concern; Leon B. Harris is treasurer, and P. F. Gillette, formerly with the Plainfield Motor Car Co., will act in the capacity of secretary and general manager.

W. M. Peale, of Philadelphia, has purchased the Varn Automobile Co., St. Louis and Campbell streets, El Paso, Texas. The name will be changed to Peale Automobile Co., and it will have the agency in El Paso and territory for Ford and Reo cars.

An involuntary petition in bankruptcy was filed last week in the United States District Court against the Plaza Automobile Co., 918-920 Union street, Brooklyn, on petition of Abraham Adelbey. The company, through its president, Howard B. Sands, admitted its inability to pay its obligations and Oscar A. Lewis was appointed receiver.



Los Angeles, Cal., real estate men are erecting a modern cement garage at Nineteenth and Arapahoe streets, that city, for which it is expected there will be many bidders. The walls will contain air chambers, insuring an even temperature at all times, and it will be equipped with turntables and all up-to-date appliances. The cost will be $15,000.

Duties of Trade Associations.

That the holding of automobile shows should not be the chief and only reason for local automobile trade associations is the opinion of Max L. Rosenfeld, the newly elected president of the Automobile Dealers' Association of California. He believes their work is much broader.

"Commercially," said Rosenfeld, in duscussing come of the larger questions of association duties, "the dealers at the present time do not hold the position in the business world that the trade demands. When we consider the large amount of money that automobile transactions represent, there are few commercial enterprises in any city that should command more attention. Up to the present time the members of an automobile trade association have been satisfied with merely keeping together for what looks like the sole purpose of holding annual automobile shows. A trade association should do more. It should look into the character of its membership. It should watch the names submitted for admission. Lax methods of doing business, and the breaking of contracts, written or verbal, on the part of either members or their customers, or on the part of the manufacturers with whom they deal should be investigated. It is only through close attention to matters of this nature that we will be able to command the respect of the business world."

Assembling: Its Relation to Success and to Failure

American cars have rapidly advanced during the last few years to a position much envied by the makers of other lands at the present time, and one of deserved repute. Their design is complete, in that it is not confined to the mere delineation of parts, but is extended to embrace the very intimate processes by which they are produced; their construction is unstinted in the matter of costly and rare materials, which are applied even in cars of the cheaper grade; the extensive use of standardized and interchangeable parts advances them still further in the path of absolute utility. But too many makers manifest a tendency to skimp in the assembling process, both the labor and pains which are due it, thereby stultifying their product and threatening at once their own position in the industry, and that of their fellow makers.

However unwelcome the fact may be, it is undeniable that just where the advantages of specialized construction of components, and the benefits of multiple production methods might best be utilized in securing a product the imperfections of which would be reduced to their lowest terms, "American haste," and a pardonable desire to reduce working costs are allowed to interfere.

Haste That Makes Waste.

Cars which are well designed, well constructed, and built of excellent materials, frequently suffer a hard life and a disconsolate end, through being put together hastily or roughly. Thousands of dollars expended in the preliminaries of manufacture, are literally wasted because the car upon which they are outlayed is dumped upon the market, with the final inspection and testing processes, either restricted by an overbearing sales department, or strangled by inconsiderate or incompetent management. The fault is not inclusive, but it is sufficiently general to attract attention. Furthermore the causes which lead up to it are so dominant and so evident as to demand immediate removal.

The work of assembling and testing cars is work of a thoroughly routine nature. It presents few of the exigencies developed by other divisions of the productive effort. Accuracy in the elementary processes is constantly improving, which tends to simplify still more these final branches of the work. Hence there is a well defined tendency to pass over them more and more lightly. But the nominal economy of hasty assemblage and inspection, develops an unsatisfactory quality in the product which though often traced to other apparent sources, frequently springs from no more remote cause. So the "turning out" of large numbers of cars at high speed, often may be counted against the maker who boasts of the fact, while every hour of labor saved in final adjustment, is taken directly from the user, who must give for it not one, but often many hours of time or its monetary equivalent.

Carelessness Spreads.

Hasty assembling means that that desire to make a showing which animates the management, is likely to be injected into the mechanics who perform the work, leading them to produce results with little regard for method. In this way small attention is likely to be paid to the alignment of bearings, for instance, and even where self-aligning systems are employed, such neglect results in the development of excessive resistance, even while the parts are in their normal relation. Similarly adjustments are apt to be hastily made, or even overlooked entirely; nuts are turned down "hand tight," and left for the wrench which is perpetually busy elsewhere; piping and wiring are strung up with an eye to convenience in the beginning rather than convenience in service; bolt holes are "drifted" into line; bearings left slack or shimmed out instead of being scraped to a seat; and generally interest in doing the work is sacrificed to interest in completing it.

Much of the result of such haste might be overcome by careful testing and running in, or "breaking in," as it more properly becomes under such circumstances. But where such conditions prevail in one department, they are almost certain to exist in the same degree throughout the plant. The tester who is given so many cars to pass up in a day, devotes himself to the simple purpose of making them pass the stated trials to which he is confined. Usually he does not bother himself with parts which are not so badly awry as to cry for a remedy. His sensibilities are not easily punctured, and much that might appeal to the owner as being decidedly wrong, escapes his attention as being trivial, or of so common occurrence as to merit no notice.

Cars so produced, when sent about their work, soon go wrong. It may be the duty of the agent to set them right; perhaps the company is so placed as to be able to rectify some of the evils which thus have been produced. Eventually, however, they rack themselves to pieces, and so the high maintenance costs of many low priced cars, becomes chargeable less to their cheap construction, than to their hasty production. Bearings which are permitted to remain out of line while the car is new, soon become loose and develop a pound. Loose nuts never tighten themselves. Poor adjustments, do not improve under the tutelage of owners who are novices. Careless handling on the road is bad enough, but added to careless handling on the assembling and testing floors, it invariably sows the seeds from which spring the junk man's harvest.

Durability of Good Work

Conversely, cars of wretched design frequently perform remarkably well, all things considered, because they have received close attention in the final stages of production. This is noteably true of some of the earlier foreign cars, which, according to present standards embody much that is radically wrong in structure and material. Yet such cars, even though produced by makers little known, in their day, and perhaps forgotten now, still amble about with no more racket than attended their progress the day they left the shop.

The contrast in this respect between old

Digitized by Google

and new cars, is frequently remarked, but seldom attributed as largely as it should be, to the fact that the early machines were put together by mechanics, and that no time was spared in making them work as well as they could work. Thus many of the old French cars, began by being old, as it were—were hundreds of hard miles old before they ever were new at all—yet their age never seems to weigh them down, and the signs of decrepitude are manifest first in their scabby paint and shaky bodies.

Considered very broadly, the relation of assemblage to the other branches of production is thus a peculiar as well as an important one. In fact, as a process, it may be considered the first real point of differentiation between motor car manufacture and machine manufacture along any one of a dozen other lines. It is the process under which the car first assumes its individuality, and as such requires a degree of specific method not found in any of the more elementary branches of its creation. Failure to regard assembling in this light may possibly account for the easy and even slipshod way in which it is passed over in many shops. Its apparent function is merely that of bringing together a number of finished parts, each of which is fitted exactly to fall into its appointed place with others to which it is co-related. Actually, it is the point at which all processes common to other manufacturing lines cease, and motor car building commences. In this way it comes to have a totally different significance.

An Aid to Specialization.

Thus all mechanical parts, for whatever use they are intended must be cast or forged, dressed, milled, drilled, jigged and fitted, according to certain methods common to every machine shop. Every part which goes into the car is produced under the well-tried rules of one or another well known trade. The purpose they are to fulfill has little effect on the detail methods of doing the work. Whatever differences exist in this way, are taken care of by the engineer in laying down the sequence of operations. But the co-ordination of the parts in the finished machine, requires a different method from that employed in the assemblage of mowing machines, for instance, or printing presses, or machine tools. Whatever advantage the automobile maker may have taken of past experience in other lines in the production of the parts, is thus lost sight of when the parts are put together, and though the process has the appearance of simplicity, its difficulties are in reality very great. In order that the parts shall go together in the way they are intended, each maker must work out his own assembling method, and the deceptive aspect of the work constitutes its greatest handicap on this account.

Incidentally, the independence of the elementary processes from the final and cumulative one, lends itself most admirably to the requirements of specialization. The mechanical processes incident to production are closely related, as already observed. Design and the sequence of operations differ more particularly with different classes of work. So the maker finds himself enabled to avail himself more and more of the specialists' efforts in parts which he buys already completed and ready for installation in the chassis. This is broad economy except where a great number of cars are to be made. But it breeds trouble unless extreme caution is employed in the assembling process.

Where all the parts of the car are made in one factory, the departments producing them may be as independent as though they were independently owned and operated, but the standards are the same, and both the accurracy and quality of the work is found to harmonize. This is not the case where parts are bought of special makers, or are jobbed in the open market. Hence the more the maker depends on outside sources of production for the components of his car, the greater the need of accurate and close work in assembling them.

Two Methods of Assembling.

Two possible methods face the maker in his consideration of the assembling problem, and their applicability depends in great measure upon the nature of the car, in regard to the relation of its parts. One may be termed the complete assembling method, and the other the partial or group system. One follows the lines of building construction, where the materials are brought onto the ground and put into place one by one as their places are made for them; while the other resembles more nearly the equipment of a factory into which are put a number of machines, each complete in itself. In the one case, the various parts are brought to the assembling floor as fast as they are required—or more often, as fast as they are made—and are used as needed. In the other, such groups of parts as are capable of independent assemblage are put together, adjusted and tested in the departments where they are produced, afterward being set up on the assembling floor. Evidently, the first method throws the onus of assembling, with all its difficulties on the assembling crew, while the second directs responsibility for a large proportion of it upon the departments directly responsible for any difficulties which may arise.

The Group Method.

Commonly, motors, change speed gears, live axles, and such of the auxiliaries as timers, magnetos, pumps and lubricators, are set up independently. Yet with proper system, the method is capable of further extension, in the assemblage of other parts, as well as in detailed operation. Complete assembling is practically obsolete at the present time, but its trail is found in the method by which the assembling crew is made to do much of the work of fitting which belongs in other departments. The more the parts are required to be complete in themselves, the more the groups are mounted and tested independently, the greater the advantage in reducing the number of operations incident to the final process, and in simplifying the work.

Furthermore, with the simplifying of the work in this way, it becomes possible to assign the operations to the same men repeatedly as the work comes up in rotation, thus developing specialization among the assembling workmen as well as in the elementary processes. The old method of giving to a single crew the entire work of assembling was wasteful, in that it prevented close time accounting on each operation. With the better segregation of the work, each man's task is laid out for him, and his time on each job is closely checked, thus making cost keeping nearly as simple in assemblage as in ordinary productive labor at the bench or machine tool.

Close Inspection Assured.

Another feature of the group method, which is of great utility, is that it compels close inspection and furnishes an automatic check on the rate of production, which is not always possible otherwise. The requirement for close accounting of manufactured parts, both as to rate of production and quantity on hand, is essential because the time required for the production of certain of the components is much greater than that required for others, while some are required in duplicate for each machine, and others singly. Hence, since all must be ready for installation at practically the same time, the rates of production of different departments must vary. Unless closely checked, any variation in this rate must put a stop on the rate of assemblage and either delay the output, or involve that greatest of all factory wastes—overtime work. Where parts are assembled group by group and the groups are tested independently, the testing or inspecting processes furnish a simple and automatic check on production, which is useful in a double sense on that account and adds but little to the expense of the bookkeeping department of the shop.

Inspection, which becomes more and more requisite as automatic production and duplicating machinery and methods are used, should not be permitted to relax as the assembling floor is reached. Yet in many cases, the fact that all parts are according to guage, and all groups have passed muster leads to the conclusion that the final gathering together of the components must of necessity proceed smoothly and without danger of error. That such is apt to be the case, however, is apparent in many cars which are assembled under this mistaken notion. The fault in any case, where difficulty arises, however, is due

Digitized by Google

rather to lack of proper oversight during the assembling process, than to any flaw in the basic method.

Where assembling is simplified in this way by the finishing and fitting of all parts, the tendency is for the mounting to be done in the most offhand and perfunctory manner. Even very considerable errors in construction of parts, may thus be passed over without correction, and great harm done in consequence. With constant oversight, however, and the use of standard methods of test, by gauge and otherwise, the checking being done by the inspection department, such errors must be discovered and recorded, not simply in season to prevent injury to one or two cars, but also in time to prevent a constant repetition of the bungle through the entire line. Similarly such a method of constant inspection demands the use of proper parts in every case, and prevents the transposition of similar parts, or the transfer of parts from one model to another.

Work of Testing by Groups.

Similarly, testing by groups before the final test of the complete machine, is at once a more exacting and accurate process than that which is possible after the chassis has been completed. The two chief points by which a running test may be judged are the heating of bearings, and the development of undue resistances. These criterions, if applied to the complete machine, while serving to indicate the presence of trouble, seldom give more than a feeble clue to its real cause. Whereas if each group of parts is known to have been in perfect running order before being assembled, any such symptoms developing on final test, at once indicate a fault either in alignment or adjustment, and show faulty work on the assembling floor, or improper laying out of the chassis.

More than that, the work of running-in and testing when performed group by group, is certain to be done with greater attention to detail than when left to the final and general test, because each department is held to certain specifications in its product and any failure other than of the most insignificant sort, involves the throwing back of the group. This lends certain prominence to the failure which otherwise might escape it. Furthermore, it places the cost of rectifying the mistake under its proper head, namely that of the producing department. Cost keeping again is simplified in this way and all cross charging between departments is eliminated.

Dangers at the Finish.

Again, however thoroughly the work of chassis assembling and testing may be carried out, there is yet room for the injury of the machine to an almost incalculable degree if it is not properly handled in the final process of finishing and reassembling. Commonly, production is accounted as being at an end when the chassis is sent up on the "paint line." Far from it, however, the dismounting of wheels, brakes, driving gear and control mechanism which is generally involved in the finishing process, together with the uniformly unmechanical tendencies of painters as a class, tends to undo much of the good work that already has been done, in the way of adjusting and smoothing the working of such parts as are subject to treatment during the final stages of completion.

Careful makers see to it that the final assemblage is placed in the hands of competent mechanics who will thoroughly clean bearings which have been exposed, and look to the final adjustments after the body has been put in place and the turnbuckles of brake and distance rods smeared with paint. Hasty production, on the other hand, implies a desire to overlook such small details and to take it for granted that the work of the road tester will be left undisturbed. How seldom it is, and how frequently cars require thorough retuning in many ways after being put into commission, only the heads of carefully conducted finishing departments know. That a great amount of such work is generally required, is beyond question. That it is too frequently overlooked, unfortunately, is true, especially in factories where records are being broken in the matter of voluminous output.

Sales Department Enters.

Here, too, the work of the inspection department should never be allowed to relax. Inspectors as a class, are unlimited by the regard for big results, which ferments in the superintendent's office. Their simple occupation of making sure that things go according to specifications, forbids any such disconcerting spirit to work. Hence it is only under the direct impetus of orders to "let them through anyhow," that their eyes can be closed to improper conditions in the product as it leaves the factory. Yet even with the best of systems, there is always a chance of lax observation and hasty or careless work, regardless of whatever pains may be taken to put a stop to it. Even at the best, all departments of the factory come under the general head of "production," and all co-operate to the one end of building cars. Every department is more or less embarrassed by conditions existing in every other.

The sales department, on the other hand, is hampered by no such intimate considerations. It is concerned only with matters relating to the salability of the product—whether it will do what it is advertised to do, and whether there is sufficient uniformity in the output to make each car actually worth as much as every other of its type. On this account the system employed by one or two American makers of the more careful sort, whereby the final test after finishing is made jointly by representatives of both factory and selling forces, appears to furnish the best cross check possible. Under this system, one inspector is actuated solely by the motives of the mechanic and the factory behind him; the other regards the car in the light of a piece of merchandise, and looks upon its performance with a view to its possible selling value.

This co-operation between the production and selling departments is a direct recognition of a true relationship which it is well to bear in mind. Nominally, close standards of design and manufacture are directed solely for the benefit of the selling end of the business. Yet too often the selling department is called upon to perform an unnatural duty in getting rid of a faulty product, and too often its relation with the active business of production is strained and inharmonious.

Value of First Perfomances.

Whatever may be the ultimate worth of a car, its performance during the first few weeks of its active service measures largely the esteem of its owner. Good running qualities early in the life of the car are more dependent upon careful assemblage and the check upon it which is obtained through careful testing and inspection, than upon quality of material or upon details of design as affecting actual performance. Therefore the maker who looks upon his product from the broad viewpoint of the merchant as well as the producer, must consider the final stages of manufacture as of supreme importance. An apparent lack of appreciation of this point has already done much harm to the typical American, product, as expressed in a comparatively limited number of machines which have been carelessly put together. So great is the need of more care in this respect, and so far have matters of design and construction progressed in other respects, that this one matter of care in applying the finishing touches to the machine well may be regarded as the crux of the situation at the present time. It is not the cars so much as the standards of the makers, which require mending, and though the requirement may be limited to but a small number, numerically speaking, its meaning to the industry at last is very great indeed.

May Build Railway Inspection Cars.

As the result of good work on the part of an experimental car which they built and which has been in use on the C., M. & St. P. Railway, it is probable that the Faribault (Minn.) Gasolene Engine Co., will engage in the manufacture of motor driven railway inspection cars. A friction drive is one of its chief features. In fact, it is stated that the motor and transmission may be applied to an ordinary handcar and thus dispense with the manual labor.

"The A B C of Electricity." Price 50c. The Motor World Co., 154 Nassau St. New York City.

EUROPEAN AND ASIATIC ROADS

French Government Dealing with the Dust Problem—Turkey Lax in Construction and Repair.

Roadways, their process of construction, maintenance and repair and the dust problem, are being given more attention and study by American consuls abroad now than formerly, before the introduction of the automobile, and it is not unusual for the daily consular report issued by the Bureau of Manufactures, at Washington, to contain one or more accounts of road building abroad. In a recent report roads of no less than three countries were discussed —France, England and Turkey.

In stating that the question of the suppression of road dust has been, within the last few years, a subject of constant attention on the part of the French government, through the department of public works, Consul W. H. Hunt, of St. Etienne, sums up the results of the experiments as follows:

"Hitherto water alone was employed for the purpose, but its effect was only transitory and the treatment had to be renewed every morning. This half measure nevertheless gave satisfaction until automobiles and road tramways began to circulate, creating, by their speed, an amount of dust as annoying as it was previously unknown. A report has just been presented to the minister of public works, reviewing the advantages and disadvantages of four methods, considered as more or less effective in laying dust—a coating of crude tar mixture, heated petroleum, a solution of water and salts, and construction of a beton and tar surface.

"To the mixture of crude tar, tar oil in the proportion of 10 per cent. is added to render it more fluid, and before sprinkling it on the road certain conditions are necessary—the road should be more or less cylindric in shape, recently macadamized, dry, and swept of all dust. The tarring should be done in dry and warm weather, while no circulation of vehicles should be allowed until the coating is sufficiently dry.

"The durability of the coating varies as to the time of the operation, whether in summer, autumn, or winter. If done in the last two seasons, the tarring seldom resists until the following spring. Very frequently it disappears at the end of two or three months leaving in its place an abundant supply of disagreeable mud. As long as the coating of tar endures, the road bed is guaranteed against wear and tear, but once it gets diluted the road becomes deteriorated all the more rapidly, as the mud retains the water with greater facility. Although the quantity of the tar mixture employed varies with the absorbent nature of the road, a proportion of two pounds to the square yard is considered sufficient Frost does not seem to have any evil effect on tarring, but heat may soften it and render it slippery. The cost of tarring is estimated at 3 cents per square yard.

"The second method, or that of petroleum heated to boiling point, is used in the north of France and around Paris. The variety of oil employed is that known under the name of "mazout." The oil is placed in reservoirs similar to ordinary watering carts and sprinkled over the roads, previously swept. It is allowed to cool, after which the dust is swept back over it again; the dust is effectively laid and will not adhere to the car wheels. Unfortunately, autumn rains rapidly destroy this coating. In dry climates, however, the above two methods are very effective against dust.

"The saline mixture consists in either plain sea water or a solution of certain salts (chloride of calcium or chloride of magnesium, which from their hygrometric properties maintain on the road the humidity of the atmosphere, thus prolonging the effect of ordinary watering. Information, however, is wanting as to the results of the experiments.

"Westrumite is tar rendered soluble in water by the addition of ammonia and other cheap products. It is particularly useful in preparing a race track, as its effects are limited as to duration.

"The fourth and last method is costly and has not yet been put into operation to any extent in France. It consists in constructing the road with beton or concrete, into which tar is incorporated. Further experiments are about to be made by the government, not only for the purpose of adopting the best dust-laying substances, but also for determining the effect of the operation itself on the roads."

Turkey presents difficulties for automobiling because of its inferior roads, which are especially bad in Asiatic Turkey, according to Consul E. L. Harris of Smyrna. "Generally speaking, road building in this part of Turkey is not in an advanced state, and but little attention is paid to it," states the American consul. "Large appropriations are made from time to time by the government for the purpose of building highways in certain parts of the country. Good roads are often built with this money, but no appropriations are made to keep them in repair after they have once been laid out. Some twenty years ago a splendid road was built from Magnesia-on-the-Meander to Sokia. About the time this road was completed a branch of the Aidin Railroad was extended to the same point, running almost parallel with the highway. From the time the railroad was completed the public highway was permitted to fall into disuse, and now it is extremely difficult for even a camel caravan to use it. The recent floods in the Meander Valley have destroyed a good roadway which led from Aidin, a town in the center of the fig district of Asia Minor, across the plain to some of the finest orchards known in that region. It is feared by those interested in figs that the road will not be repaired in time, if at all, in order that this season's figs from that particular district may be moved as rapidly to market as has hitherto been the case.

"The roads in the immediate vicinity of Smyrna are kept in a fairly good state of repair. This is more or less due to the iniative and energy of the British residents of Smyrna and the two suburban towns of Bournabat and Boudja. One enterprising Englishman practically built the road between Smyrna and Bournabat, a distance of five miles, and he gets the interest on the money invested and keeps up repairs by charging a toll on all vehicles which traverse the road. He is also the owner of the only automobile in Smyrna, a machine which he imported from Switzerland two years ago, but about the only place he can use it with any degree of enjoyment at least is on his own road between Smyrna and Bournabat. I am also informed that a second road is being built by him, in the same way, to connect the two suburban towns of Cordelio and Bournabat. It is therefore self-evident that the condition of the public roads in this part of Asia Minor will always militate against the use of the automobile in these parts, and it is extremely unlikely that this country will ever offer a market for these machines.

"The general make-up of Turkish cities and towns also acts as an obstacle against the introduction of automobiles. The streets, apart from being narrow and winding, are paved with cobblestones and are extremely rough. This primitive pavement is gradually being replaced by flagstones, with which all principal streets are now laid. Unfortunately the preparation of the roadbed prior to laying the flags is so insufficient that within six months a newly paved street is practically in need of repair. It is hardly to be hoped that conditions in the road and street line will soon change in Turkey."

Club's Work for Good Roads.

At its annual meeting at Lansdowne, Pa., last week the Delaware County Automobile Club announced that it had done much for the betterment of roads in the county during the past year, and would work with the supervisors for a continuation of the good work next year. Although organized only a year ago the club now has 150 members and is in a flourishing condition financially. The officers elected at the annual meeting are: President, J. H. Weeks, Rutledge; vice-president, W. P. Anthony, Eddystone; treasurer, J. E. Mitchell, Glenolden; secretary, Dr. E. M. Harvey, Media; auditors, A. H. Tomlinson, Dr. Miller and J. D. Wood.

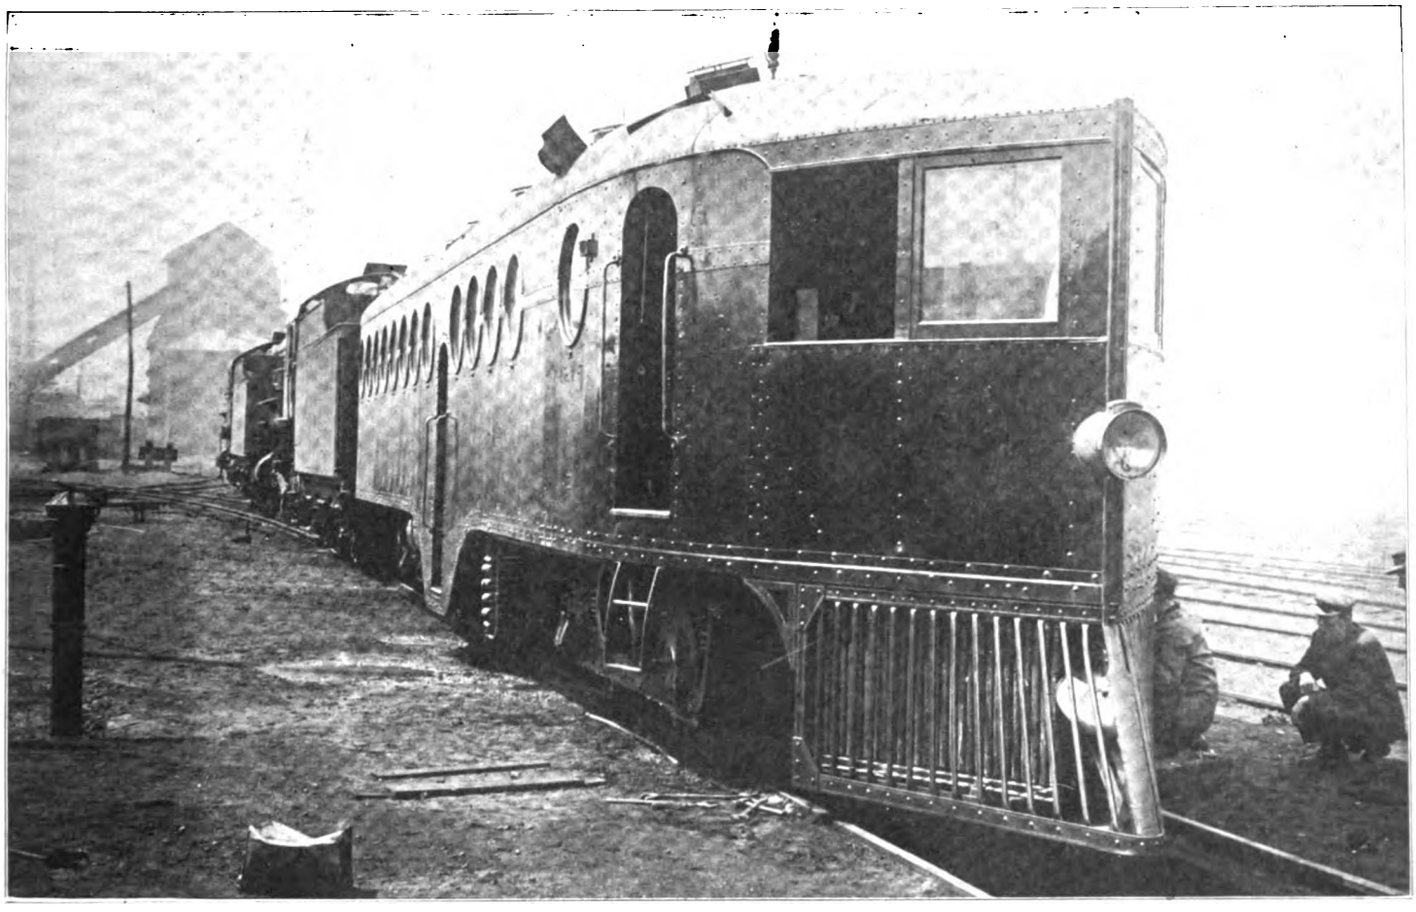
Development of the Railway Motor Coach



Probably no factor has offered a greater chance for railroad service, in such a short length of time, than has the gasolene engine. The modern locomotive, with high steam pressure and the attendant flue and fire box troubles, the troubles due to formation of scale, broken staybolts, leaky front ends, defective draft, poor coal and kindred necessary evils incidental to the use of a separate power generating unit, such as a boiler entails, is a much more complicated and vulnerable piece of machinery than the gasolene motor car. The complicated generator with its attendant multitudinous parts that are like to get out of order is absent in the gasolene engine, so that it follows, that a gasolene motor car, properly constructed and built with the same care and skill as a locomotive, is much less vulnerable a machine than a locomotive and should give more continuous service without breakdowns.

To the theorist, at least, it always has appeared that while the advantage of the gasolene railway car for short hauls or on branch lines is self-evident and that it may permit two trains where one exists to-day, its possibilities even for long travel, particularly in the nature of "specials," or "limited fliers" or for private service, scarcely have been scratched. ,

It was due to the fact that although on many of its branch or interurban lines steam passenger lines are operated at a financial loss, the passenger service must be maintained notwithstanding, the Union Pacific Railway was led to experiment with the gasolene railway coach, and the man responsible for the experiment is W. R. McKeen, Jr., superintendent of motive power and machinery, at the Union Pacific's shops in Omaha, Neb., through whom the gasolene motor car has reached what may be termed a state of accomplishment.

Since Superintendent McKeen constructed the first experimental car in March, 1905, the Union Pacific Railroad has built thirteen gasolene motor cars, each of which has been an improvement on its predecessor and has pointed the way to greater things. This railroad has thoroughly demonstrated the practicability of the gasolene coach for railway purposes to such an extent that twenty-two additional cars are in course of construction.

From time to time since the first one was built spasmodic reports of its performance have found their way into print, but it was not until this week when the Union Pacific itself issued a beautifully printed

ONE OF THE UNION PACIFIC'S GASOLENE MOTOR CARS

Digitized by Google

and illustrated brochure on the subject, that a full and sufficient story of the development of the cars and of the "gasolene service" became available.

First Car an Experiment.

The first car built, No. 1, was an experimental car, thirty-five feet in length, mounted on a single four-wheel truck, the wheels of which are 42 inches in diameter. The weight of No. 1 is a trifle over twenty tons. That car was turned out of the shops during the last week in March, 1905. Before being tested in actual road service it was thoroughly operated and broken in around Omaha shops and vicinity, and during these tests the motor car was coupled to two passenger cars, a standard mail car weighing 52,100 pounds and a standard coach weighing 60,000 pounds. These cars were successfully started and accelerated, both on a descending grade and on a one-third per cent. ascending grade, the motor thus starting a total load of 152,100 pounds.

Pulling the mail car alone, a trip was made to South Omaha and return. This is up a 1.6 per cent. grade, which was ascended at the rate of 11 miles per hour, the total load pulled being 94,000 pounds. In another test the motor car successfully ascended a sharp grade of 7.8 per cent., or about 400 feet to the mile, the car being stopped and started repeatedly on the grade.

Its first long distance run, however, was inaugurated on April 2, 1905. Leaving Omaha at 10 a. m., the run was made west to Valley on the main line of the Union Pacific, a distance of 34.8 miles, and the performance was successful, especially on the return trip, when the schedule for ordinary passenger trains was maintained without effort. Leaving Omaha April 16th, the car made the trip entirely under its own power from Omaha, via Denver, to Portland, Ore., and return. Its most notable achievement on that trip was in climbing Sherman hill, the summit of the Rocky Mountains, after leaving Cheyenne; the steep grade is 27 miles long. Motor Car No. 1 went into regular service on August 21, 1905, making one round trip daily between Kearney and Callaway, Neb., a distance of 65 miles.

Standard Design Adopted.

Motor car No. 2 was then built. It is an all steel car of standard design for these cars, six similar to it already being in service. This car has two four-wheel all steel trucks; the driving wheels are 42 inches in diameter, the other wheels 33 inches. It is 55 feet long, and has a seating capacity of 57. The inside finish of the car is antique mahogany, the ceiling being cream white with decorations in gold and sepia, making a striking but harmonious contrast. The seats are finished in leather, with a semi-circular tufted seat, as in small launches, at the rear. Maroon, striped in gold is the exterior finish of the car, while the trucks are painted olive green.

With its steel sills and bracing, the steel car lines and ribs and the angle bracing and outside steel shell, the new car is one of remarkable strength, affording great safety to passengers in case of accident or wreck, as the structural design and strength of the car almost entirely precludes the possibility of telescoping. In line of design, the car body is similar to that of a racing yacht inverted, the front of the car being tapered off into a sharp point, and the roof being rounded off at the top, presents no flat surface for wind resistance. As the rear of the car is rounded off as well, the usual vacuum produced by flat end cars is avoided.

Ventilating and Heating.

The upper deck and the old-style sash ventilators have been entirely done away with, adequate and sanitary ventilation being secured by means of roof ventilators, which exhaust the air from the inside by suction, fresh air being taken from the front of the car, through the roof. By this method a complete change of air can be secured every four minutes, if desired, and the unsanitary atmosphere condition so often encountered in old style cars is entirely avoided. To further augment sanitation the floor of the car was made entirely water tight and can easily be cleansed by flushing with hot water, destroying all germs and disease.

Two ingenious systems of coils afford a perfect system of regulating the temperature inside the car. In cold weather heat is radiated to the interior of the car by running the water from the cylinder jackets of the engine around the sides of the car, and in warm weather this water is piped to coils immediately below the car. The acetylene gas lighting system is used, giving a powerful light for the headlight, and the lamps on the interior are provided with opalescent panels, producing a soft and at the same time a powerful light.

The car is equipped with air brakes of the direct system, with braking power on all wheels. Attached to the crank shaft is an air pump which supplies and maintains 100 pounds air pressure in two reservoirs of 41 cubic inches each. Numerous tests at a speed of twenty miles an hour have shown that the car stops in 112 to 115 feet, without inconvenience to passengers. To provide additional and auxiliary safety the car also is equipped with a ratchet lever hand brake.

Details of the Engine.

A six cylinder gasolene engine, built after special railroad patterns, designed to meet regular car service, and rated at 100 horsepower, is the power plant of this car. It has make and break ignition with a primary battery to start on and a magneto for regular running service. The cylinders are 8x10 inches, of the upright type, placed at right angles to center line of car. The six cylinders are arranged and connected up in opposed sets of three cylinders, resulting in three power giving pulsations at each revolution of the crank shaft. Air is used for starting the engine and a synchronizer facilitates and simplifies the changing of speeds. Immediately in front of the operator is the air brake valve lever and the emergency spark cut-out which enables him to stop the engine and apply full brake power in less than half a second. The clutches and controlling devices are all mechanical and of the simplest design. By means of a special chain the engine crank shaft drives direct onto the driving axle. The metal clutch operated by hand levers, which proved so successful on Motor Car No. 1, has been applied to No. 2, but is operated by air pressure, controlled by a specially designed operating valve, by means of which the car is started at slow speed, engine disconnected, or thrown into high speed at will.

The Capacity for Speed.

The cars are capable of a speed of from 40 to 60 miles an hour, the acceleration from a standstill to 300 feet is claimed to be superior to any electric car of the same horsepower, it being slower than any electric car for the first fifty feet, thus eliminating jerking in starting while the acceleration from 100 feet on is very rapid. On a level or one-half per cent. grade the car starts readily on high speed, directly connected without the use of gears; although on anything over one-half per cent grade, or with a heavy trailer, it is necessary to use the gear speeds. One operator is all that is necessary to operate the car, and it can be stopped and reversed at will, although designed to run in one direction.

Tested in Hill Climbing.

Motor Car No. 2 was tested as thoroughly as its forerunner and its initial official trip was made September 14, 1905, when the car ran from Omaha to Valley, Neb., a distance of 34.8 miles. On the westbound trip no effort was made to make a fast run. However, the distance was made in 1 hour 11 minutes, actual running time. Especially noteworthy was the performance of the car ascending Elkhorn hill, where the grade is 42 feet per mile. The hill was ascended at the rate of 32½ miles per hour. On the return from Valley the trip was made in 57 minutes actual running time, an average of 37 miles an hour, which was at one time increased to 52 miles. A week later the car made its second trip to Valley, and this time it averaged 39½ miles an hour on the west bound trip, which it increased to 30 minutes for a 25-mile run on the eastern trip, of an average of 50 miles an hour. Several miles of this run were made in 57 seconds, or 63.2 miles per hour, and mile after mile was accomplished at better than a mile a minute. Since October 6, 1905, No. 2 has been in regular service on

Digitized by Google

the branch line between Kearney and Callaway, Neb., making one round trip or 130 miles daily, and on the branch St. Paul to Loup City.

Motor cars Nos. 3 and 4 are of the same general design and description as No. 2, except the former have baggage compartments. Cars 5 and 6 are the same as No. 2. No. 3 left Omaha November 10, and made the trip under its own power to Houston, Tex., and now is in regular service on the Southern Pacific, making the trip between Houston and Galveston. No. 4, after being turned out of the shop, made a trip to the Chicago and Alton road and was in service on that line out of Bloomington, Ill. This car also made the trip to Portland, and was in service there from April 16 to August 4, when it returned to Omaha, and since has been in regular service on the Kearney and Callaway branch, in conjunction with No. 2. Car No. 5 left Omaha January 5, en route to Los Angeles, reaching that place January 23. The distance from Salt Lake City to Los Angeles, 778 miles, was covered in less than four days, running eight hours a day. The car was tested on various lines and since its return to Omaha, was put on regular service on the Loup City-St. Paul line. No. 6 is in service between Leavenworth and Lawrence, Kan., making the round trip of 68.6 miles daily. The train consists of the motor car and trailer and is operated on the regular schedule of a steam train. These trailers are combination, baggage, mail and express cars, 31 feet long, mounted on a 4-wheel rigid truck, and weigh 18,000 pounds. The exterior finish is the same as that of the motor cars.

Improving the Design.

While Motor Car No. 7 is of the same general design as previous cars, it embraces some new features. The square design of the window has been done away with and the air, water and dust proof round window sash substituted. The sash is similar to the port hole of a steamer, and keeps out all the elements, which the double sash in the finest Pullman is unable to do. Car No. 7 has side entrance, doors being located near the center of the car. The passenger compartment is 41 feet long, with a total seating capacity of 75. The seats are built-up veneered wood seats, with seating capacity of three people each, while the semi-circular seat in the rear holds 11 people. The roof of motor car No. 7 is nine inches lower than in the other motor cars, and as the others are 15 inches lower than an ordinary passenger car, this makes No. 7 two feet lower than the ordinary coach. The interior of the car is finished in English oak. Its weight complete is 58,000.

On April 4, No. 7 made its initial trip to Valley and attained a maximum speed of 45 miles. It first long distance trip was made a week later, when it was run as second section of No. 1. The car gained on No. 1 to such an extent that at Fremont, 46 miles from Omaha, it had to be held on the block six minutes. The actual running time of No. 7 to Grand Island, 153.6 miles was 4 hours 32 minutes, an average of 34 miles per hour. Although a hot bearing was met with on the return trip the distance was made in 4 hours 10 minutes, averaging 36.3 miles per hour. A maximum speed of 53 miles an hour was attained on this trip. This car is now in service on the Erie Railroad.

Developments in the Engine.

The car body and trucks of No. 8 are similar in design to those of No. 7, and few changes have been made in the mechanical transmission on the front trucks from that used on previous cars, except to substitute steel gears instead of bronze. The engine proper was built in the Omaha shops. Its cylinder dimensions are 10x12, and is rated at 200 horsepower. The engine was particularly designed for motor car service with a view of overcoming the ordinary troubles experienced with gasolene motive power, the reliability of performance being an absolutely essential feature of the motor car service, where cars are operated in conjunction with and on the same track as steam locomotives. The engine is designed to develop a high percentage of horse power at the lower speeds with the express object of facilitating the acceleration of the car. It generally is claimed that a gasolene engine is a constant speed machine; the engine on No. 8 was especially developed with the idea of controlling the speed of the car by regulating the speed of the engine; the engine's speed being increased or decreased simply by opening or closing the throttle and regulating the spark. The speed of this car can be regulated by means of the engine alone, from two to 65 miles per hour. Although rated as 200 horsepower, the engine actually develops 230 horsepower.

Features of the Transmission.

The engine is directly connected to the axle, although it is preferable to use the gear in putting the car in motion, but after once in motion the gears are thrown out and the speed of the car entirely controlled by the speed of the engine. One special feature of this engine is that all parts have been given good liberal bearing surface, and the design, the patterns, the castings, the workmanship, all have been simplified to admit of material for repairs being obtainable at any ordinary repair shop. Another feature of this engine design is that the exhaust and inlet valves, the air valve, spark plug, valve stems, valve seats, and in fact, practically all the engine mechanism, is a part of the cylinder head, so in case of trouble, with any one part, or breakage, repairs are greatly facilitated by applying a new cylinder head complete, while the old one can be sent to the shop for detail repairs. Thus the life of the engine is indefinitely extended. The car weighs 61,000 pounds, and is finished in Cuban mahogany. Ventilation is obtained from the use of the air intake and the Cottier exhaust ventilators. Motor Car No. 8 went into service between Lincoln and Beatrice, Neb., in September, 1906, making round trips daily, and since that time has failed but once. So successful has its work been that 22 additional cars of the same design now are being constructed by the company at the Omaha shops.

Numbers 9, 10, 11, 12 and 13 have been placed in service out of Denver, Col. The engine of No. 12 was tested out with a hydraulic brake test and developed 250 horsepower at 500 revolutions per minute. No. 9 has a special engine developing 100 horsepower. These cars all run 60 miles an hour and some of them at a speed of from 65 to 70 miles.

Severe Endurance Test.

The endurance test of No. 12 was one of the severest ever accorded gasolene motor cars. Previous to starting on the trip to Denver, August 22, it had made only two trial trips, and there was some question about sending it on such a long trip without a more thorough tryout. But the designer was sanguine and the car proved its worth, making the trip of 586 miles in 16 hours 34 minutes; the running time of the Colorado Special is 17 hours 15 minutes. On July 29, 1907, the car was tested out more thoroughly, hauling successfully back and forth over the same track ten empty freight cars. Two days before that Car No. 10, under the same conditions that a locomotive would operate, placed a 40-ton carload of coal up the incline of coal chutes at the Omaha shops.

Adjusting Shock Absorbers.

In adjusting shock absorbers it is absolutely essential that those applied to opposite sides of the frame upon either end be given the same tension. The sets applied at the front and rear ends of the car may be differently adjusted without injuring the chassis, and frequently, where the load is unevenly distributed or the springs are not properly proportioned, this may be done to considerable advantage. Where opposite absorbers are differently tensioned, however, the tendency is for the chassis to be racked and strained under usage, exactly as would be the case were springs of different strengths to be applied in the same way.

Motor Mail Wagons a Success.

Use of automobile mail wagons for collection purposes has proved a great success in Milwaukee, where the expreiment was first tried. Since their installation the cars have traveled more than the distance around the globe. During the eight months they have been in service Milwaukee's motor mail wagons have covered 28,000 miles in congested streets, and the mail service in that city has been greatly facilitated by their use.

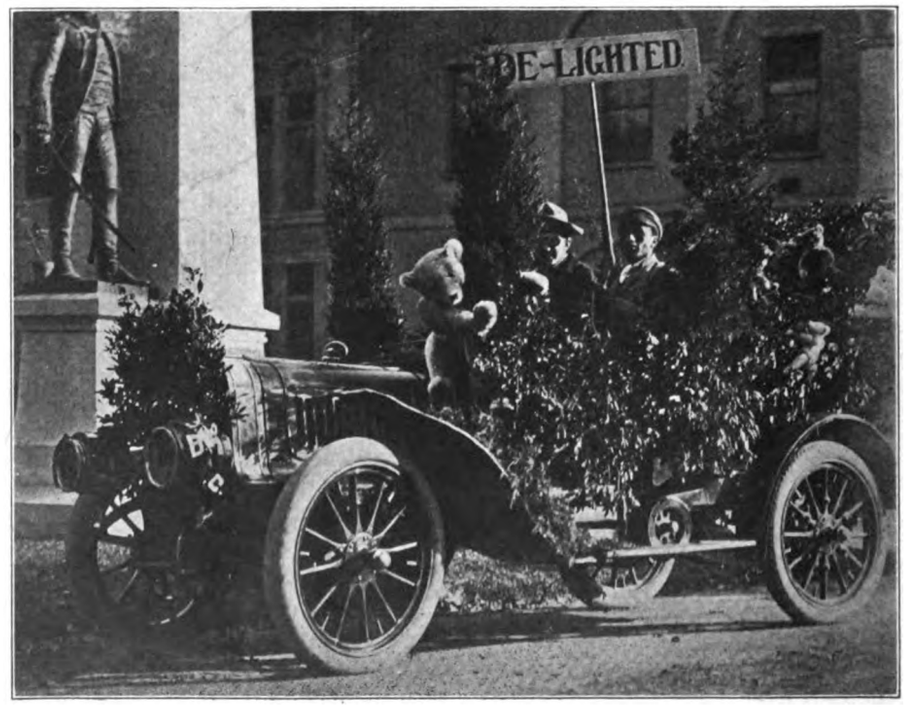
HACKENSACK'S FLORAL DARADE

Many Beautifully Decorated Cars in Line—President Roosevelt in the Louisiana Jungle One of the Features.

Historical Hackensack, N. J., mentioned in all entomological works on account of its mosquito producing meadows and in Jersey guide books as the home of great commutors, to say nothing of the fact that George Washington once visited "in its midst," had reason to be real proud and harbor a welcome-to-our-city-and-peace-be-with-you feeling last Saturday, 19th inst. Automobiles gave the old town a new experience to talk about. More than forty gayly decorated machines, all displaying evidences of originality of design and artistic taste, paraded through the main thoroughfares of the town and competed for prizes. The parade, crystalized into an actuality by the Bergen County Automobile Club was, beyond peradventure, one of the most successful and pleasing of the year.

The club offered three prizes—for the first and second best decorated cars and for the most unique creation—and as two-thirds of the judges were local ministers, there could be no question over the result. The procession formed in front of the green at the historic Mansion House, where there is a tablet marking the spot where George Washington had his camp during the Revolution. As the two ministerial judges, not to cast any reflections on the other judge who was not a reverend divine, stood directly in front of tablet-reminder of the veracity of the Father of Our Country and Hackensack, N. J., every one could see that the decisions must be just. But all thoughts of georgemcohan—beg pardon, Washington, were relegated to the archaic past. President Roosevelt and his bear-slaying propensities were in the ascendency, depicted most forcfully by the decorations in H. M. Bogert's Pope-Toledo, which was a minuature Louisiana jungle, with the president himself, represented by the driver, attired in regulation hunting togs and a rough rider hat, at the wheel, and beside him a negro guide holding aloft the standard "which bore this strange device"—"Delighted!" A big teddybear, one that the president didn't bag, played hide-and-seek behind a small tree.



WINNER OF PRIZE FOR BEST DECORATED CAR

Mayor Courtland Linkroun headed the parade. Just behind came Frank Ackerson's car that won first prize. A canopy richly adorned with white lilies was erected over the car, its sides enclosed with green lace. A large white teddybear was seated on the bonnet and the wheels were green rosettes. Totally different was Joseph M. Diaz's ackard, which was accorded second prize. Against a solid background of black were wreaths of yellow chrysanthemums, while Mr. Diaz's little daughter sat in the middle of the car holding long yellow driving reins. It was no easy task to pick the most uniquely decorated car. The judges picked Mrs. W. A. Atwood's Maxwell, though some thought the prize should have gone to the Louisiana "jungle" and "President Roosevelt." Mrs. Atwood's car bore a huge sign, "Country Pumpkins," and on every available space was attached big Bergen county pie fruit. Where there wasn't room for a pumpkin yellow hollyhocks concealed the bare spots.

Wilson Heads Houston Club.

The Houston (Texas) Automobile Club has elected the following officers for the ensuing year: President, Harvey T. D. Wilson; vice-president, C. H. Dunbar; secretary, S. E. Bering; treasurer, J. W. Thiel; governors, C. G. Pilot, Colonel Thomas J. Anderson, Douglas Burnett and O. J. Lorehn.

STRANG CUT OLDFIELD'S FIGURES

Did a Mile in 51¾ Seconds at Birmingham—Meet Unsanctioned and Record May Not Stand.

Walter Christie will doubtless realize that it is better to travel alone than in bad company. On Wednesday last, 16th inst., at Birmingham, Ala., Christie's racing car broke the world's mile track record in 51¾ seconds, but as the time was made at an unsanctioned meet, and one that was promoted by William H. Pickens, a suspended promoter, who acts also as Christie's business manager, it is not likely that the time will be accepted, although application has been made for a post-sanction from the American Automobile Association. The amusing part of the affair is that sanction was not applied for until after the time was made in order to make it an official record, a dodge of a publicity promoter that undoubtedly will fail in its purpose. In addition, Strang will probably be shelved for some time from future sanctioned competition as this is his third offense, the first being at Nashville, and the second at Atlanta.

The meet was arranged by William H. Pickens, under suspension by the American Automobile Association; and Homer George, a New York publicity man, who once lived in Birmingham, and it was carded as the feature of the Alabama State Fair. So far as the Motor World can learn the other drivers, besides Strang, who made themselves open to suspension by competing at the meet, are John Fahey, a 12-year-old Birmingham boy; W. T. Harrison, Charles Denegree, and another local driver named Wood.

According to Birmingham reports more than 5,000 people were in the grandstands when Strang came out for his record trial. The circular mile track is one of the best in the country and was in excellent condition, except perhaps a trifle dusty. Strang has nerve and plenty of it, for he steered the front drive racing car around the circular track in 51¾ seconds; the record for a mile track is 52 seconds, held by Barney Oldfield, who now also is under investigation by the racing board for having promoted and competed in unsanctioned track races.

After this Strang drove three miles in an attempt to lower the local record of 3:45 set up by Oldfield on the Birmingham track last year. Strang was successful as the timers clocked him at 3:03.

Charles Denegree won the "amateur championship of the State," his time for three miles being 4:33. The three and a half mile pursuit for Franklin cars was won by Wood in 6:29. John Fahey, a 12-year-old youngster, finished second. W. T. Harrison finished first in the four mile Cadillac handicap, covering the distance in 6:41.

Prize Winners in Malden Parade.

With 65 cars participating, and most of them decorated, the first parade of the Malden (Mass.) Automobile Club last Saturday, 19th inst., was a pronounced success. The route of the parade covered 15 miles, and of the 65 starters, 59 completed the run and drew up in front of the judges' stand for the award of prizes. For the best decorated touring car Charles W. Small of Malden took the prize. His car represented the battleship Illinois, with members of the party in full dress naval uniform. Second prize was awarded to James W. Wilmot. First prize for undecorated cars went to J. W. Maguire, and second to Willard E. Robinson. Miss Guptill won first prize for decorated runabouts, and second was accorded Dr. C. C. Burpee. In the undecorated division of this class, first and second were awarded respectively to Willard E. Robinson and Miss Chamberlain. Malden and Melrose Gaslight Company's truck won first prize for commercial vehicles, second going to Gerald A. Sullivan.

New Boston-New York Record.

Ray McNamara and George Preston of Boston took chances with the police last Thursday, 17th inst., and succeeded in seting up a new record from Boston to New York and return. Allowing 36 minutes for luncheon in New York the round trip was made in 22 hours 59 minutes actual running time. McNamara and Preston started from Boston in a 4-cylinder 24 horsepower Premier car at 3:58 a. m., and arrived at Columbus Circle, New York City, at 1:51 p. m. Before leaving Boston both bonnet and high speed gears were sealed and these seals were intact when the car arrived in New York City, and also when it got back to Boston. On the return trip to the Hub McNamara and Preston left New York at 2:28 p. m. and were checked at Boston the following morning at 3:34 o'clock, making the elapsed time fo rthe round trip 22 hours 59 minutes.

Electric Car Makes 100-Mile Run.

A road run of 101⅛ miles in a stock Columbus-Stanhope electric car was the stunt performed by Charles S. Henshaw of Boston, Thursday last, 17th inst. Henshaw started the trip from in front of the State house in Boston at 9.30 a. m., Thursday, followed by a car containing observers. The route was through Charlestown, Chelsea, Revere, Lynn, Swampscott, Phillips Beach, Salem, Beverly, Pride's Crossing, Manchester, Magnolia, and Gloucester. The run to Gloucester, 35 miles, was made in three hours. A slight detour was made on the return trip which made the total mileage back to Boston 74.7 miles. Continuing, Henshaw rolled his mileage up to 101⅛ miles before the current was exhausted.

KULICK DEFEATED BY DISASTER

Badly Hurt at Detroit in Attempt to Make New Mile Record—His Car Turned Three Somersaults.

Frank Kulick, of Detroit, who has gained prominence through his connection wtih Ford interests by driving its cars in races, was seriously but not fatally injured while attempting to break the world's mile record at the State fair grounds track, Detroit, Friday afternoon last, 18th inst.

For some time Kulick had been privately testing the new 120 horsepower six-cylinder Ford racer and when it was unofficially timed at 49 seconds for the mile, Henry Ford decided to obtain sanction from the American Automobile Association for an official trial.

Kulick had been burning up the track for fifteen or twenty minutes at 52 and 53 seconds to the mile, when he made ready for the mile trial. The timers got their watches ready as Kulick let the big car out and came thundering down the stretch for the start. A second later the car skidded on the lower turn and plunged through the wire fence, turning over twice before it landed bottom up. Kulick was hurled some distance away and was conscious when the spectators reached him, although he was hysterical.

There was some delay in securing a hospital ambulance to come out of the city limits so Mr. Ford directed that the rear tonneau of his touring car be cut out to make room for a stretcher with Kulick upon it to be placed within. Then he was taken to a hospital where it was discovered that his right knee cap is split and the right femur broken in two places, near the middle and near the knee joint. He also sustained contusions along the spine, shoulders and back of the head, but the doctors promise recovery, although it will be some weeks before the injured man can leave the bed. The car was partially wrecked. According to local newspapers Mr. Ford declared that he will never build another racing car.

Delevan Owners Form a Club.

The Delevan Automobile Club, of Delevan, Ohio, was organized last week with the following officers: President, E. M. Wayne; vice-president, C. B. Wood; secretary, Dr. G. W. Fockler; treasurer, Daniel Crabb. The club starts with a membership of nineteen, and plans to hold a race meet soon.

The Automobile Club of Buffalo, N. Y., claims to be the largest local organization in the world. At its meeting last week it admitted 96 new members, which brings the total membership up to 1,023.

BLOWS HER HORN WELL, AT LEAST

Chicago's Professional "Chauffeuse" Lists Her Qualifications—She Claims Superiority for Women as Drivers.

Are women professional chauffeurs discriminated against because of their sex? Offhand, this question seems easy to answen because the feminine chauffeur is as yet a rarity in this country, but when Marys and Roses and Angelines become as common in the chauffeur's seat as mere Johns, Jameses and Henrys, they no doubt will be discriminated against by the opposite sex to the same extent that women have always been discriminated against when entering upon the vocations generally followed by species of the genus homo. But that is not the question.

There is a feminine chauffeur, or perhaps, chauffeuse would sound better, in Chicago against because she wears her hair long and skirts, and not because she hair long and skirts, and not because she lacks any of the essential qualities that go to make a good knight of the steering wheel. She is Kathryn Lockwood, who worked for some time in Los Angeles as a china painter, and went to Chicago, announcing that her sobriety should qualify and land her a job as a professional chauffeur. Miss Lockwood found that her chosen professional career was not a palm-girt boulevard in Chicago, at any rate, so she has written to a good friend on her home paper, pleading the advantages of her sex so well that she should get a position as Lady of the Steering Wheel very quickly. In part, this chauffeuse is quoted as setting forth her position thus:

"I am only waiting an opportunity to demonstrate to the public in general that women will be as great a success in the automobile trade as we have proven to be in other lines of business. The advantages in having a woman driver are:

"Cautiousness—A natural quality of a woman, and the first requisite of a good chauffeur.

"Cleanliness—A clean machine will last twice as long as one which is allowed to go with only the sides and tires washed. In cleaning a machine thoroughly every day, bolts and nuts just working loose are found and tightened, saving the chance of breakdown. Cleanliness is a prime natural quality of women.

"Frugality—A natural quality of women, very helpful to the owner of the automobile.

"Good Habits—Many more reasons could be named, but none which would be better recommendation than this. Men drink and smoke, and both are against a chauffeur.

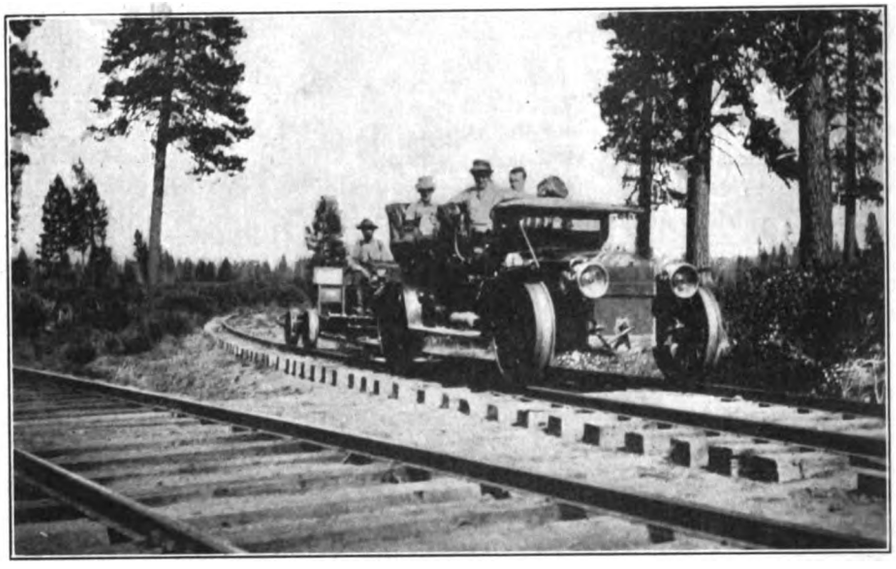
"Why is it that I am discriminated against, simply because I am a woman? If I can do the same work and give more satisfaction than a man, why not give me a trial?

"I am willing to go on any tour, or ride in any race—I will, in fact, go any place on the globe than an automobile will go. I am a good talker, a good saleswoman, and I can repair and run both automobiles and motor boats. I would prefer a position as a demonstrator with some firm, but I will take work in a public garage, in a private family, or I will drive a commercial truck, I will take entire charge of my car, keep it clean, and do all my own repairing. I am not afraid of hard work.

"All I want is an opportunity to prove my ability in my chosen profession. I am ready to furnish references. Is there any one in California who will give an energetic, ambitious woman a chance to make good?"

Incidentally, Miss Lockwood emphatically states that she will not discard her skirts for masculine raiment.

Made Angry by Red Ink.



Another Philadelphian has made a tilt against the New Jersey department of motor vehicles, and after December next may have to find an automobile route between the Quaker City and New York which will keep him outside of the intervening State. The "blood on the face of the moon" consists of red ink used in endorsing a letter returned to Dr. Lewis H. Adler, of Philadelphia, for correction of a clerical error in the application for a renewal of his driver's license.

Dr. Adler was angered by the ruby endorsement, regarding the use of red ink as an insult. Accordingly he wrote a letter to that effect, requesting the return of his $3, sent in the previous letter, unless an apology were made. Commissioner Smith returned the money. In place of an apology Dr. Adler received notice to appear before the department to show cause why his license should not be revoked.

AUTOMOBILE FOR ROAD OR RAIL

How an Ingenious Californian Avoids Poor Highways—His Car Can be Adapted Quickly to Railway Travel.

Without suitable roads on which to run an automobile, most men would give up the idea of operating a machine, but S. O. Johnson, of McCloud, Cal., refuses to be deterred by any such difficulty. His business requires him to make extended tours through the timber country, many parts of which are impassable for a motor car. When he encounters a stretch of the latter sort,

TOURING CAR FITTED FOR RAILWAY TRAVEL

he fits a special set of railroad wheels to his Thomas Flyer, as shown in the picture, and takes to the railway tracks. The work of fitting the special wheels seldom takes more than half an hour, and the car so equipped is capable of the speed of the fastest "limited" that travels in that part of the country.

"Joy" Ride Led to Sorrow.

Harold Crawford, a 17 year old Buffalo lad went "joy riding" one night last week; now he wishes he had not. For a long time Harold's "lady friend" has been beseeching her youthful lover to take her automobile riding, and although Harold did not possess a car or the requisite hire of one the appeals became so strong that he cast discretion to the four winds and made off with Police Commissioner Zeller's car. He had taken his "lady friend" for a ride and was returning when the police nabbed him.

Automobiles have been barred from the parks, boulevards and lawn extensions of Ann Arbor, Mich. The city council met last week and passed an ordinance which has that effect.

The Week's Patents.

863,403. Speed Indicator. Carl Knopf, New York, N. Y. Filed Jan. 10, 1907. Serial No. 351,645.

1. A speed indicator, comprising a casing having an inclined front wall, a vertical shaft within the casing, an inclined shaft within the casing and mounted substantially parallel to the front wall, bevel gearing connecting said shafts, centrfugal means carried by the inclined shaft, a longitudinally movable rod connected to said centrifugal means, an indicator adjacent to the inclined front wall, and means whereby movement of the rod causes a corresponding movement of the indicator.

863,406. Motor Vehicle Actuated by Friction Gear. Josef E. Labus and Gustav J. Schreiber, Vienna, Austria-Hungary. Filed March 13, 1906. Serial No. 305,791.

1. In a motor road vehicle actuated by friction gear, the combination of a vertically arranged motor provided with cooling ribs and seated in the fore part of the vehicle with its shaft parallel to the wheel axles, fiywheels on the ends of said shaft, fans operatively connected with the flywheels, one of said flywheels being disc-shaped, and a friction wheel adjustably arranged across the face of said disc-shaper flywheel, substantially as described.

863,449. Valve. Charles G. Richardson and Frederick N. Connet, Providence, R. I. Filed March 6, 1905. Serial No. 248,439.

1. In a device of the character described, the combination of a valve seat, a valve, a stem, a spring, and a locking device upon the stem including a collar to form an abutment for the spring, means engaging said stem to prevent the accidental removal of said collar therefrom, said engaging means being itself normally held from removal from said stem by engagement with said collar, and means whereby said collar may be withdrawn from said engaging means and locked to the stem against an endwise movement to permit the removal of said engaging means from said stem.

863,488. Vehicle Tire. Joseph Allend, Philadelphia, Pa. Filed March 19, 1906. Serial No. 306,707.

1. The combination of a wheel rim having a peripheral channel therein, a resilient tire within said channel and having an interior diameter greater than the diameter of the base of the channel, a retaining ring extending through the tire radially arranged bolts engaged with said ring and extending through said rim to retain the tire within the channel, a pair of spring rings laterally of said bolts and of greater diameter than the diameter of the base of the channel and engaging said tire, and means arranged at intervals around the tire to prevent movement of said rings toward the base of the channel.

863,516. Carburetter. William E. Downing, Des Plaines, Ill. Filed Nov. 16, 1905. Serial No. 287,705.

1. In a carburetter, the combination of a casing having a valve controlled inlet disposed centrally of its bottom and having an annular groove in the upper side of said bottom and provided with radial openings in the outer edge portion of said bottom in communication at their inner ends with said annular groove, and a valve of approximately frusto-conical form having an inwardly extended flange to rest upon the bottom of the casing and normally close the upper sides of said annular groove.

863,539. Wheel Tire. Adoniram J. James, Houston, Tex.. Filed Dec. 26, 1905. Serial No. 293,303.

1. A device of the character described, comprising a bridge-piece forming a tire-splicing member and having a longitudinal groove in its underside; inward extending lugs projecting from the tire and having ribs entering said groove, series of removable "riders" adapted for insertion between said bridge piece and tire ends, tightening means between said lugs, and securing means between said bridge piece and said tightening means.

863,565. Vehicle Spring. Joseph H. Athons, Los Angeles, Cal., assignor to Joseph Lawrence Pike, Los Angeles, Cal. Filed Feb. 20, 1907. Serial No. 358,516.

The combination with an axle, of a spring seat thereon provided with a hole, a plate provided with a stud exgaging in the hole, and also provided with countersunk bolt holes, the countersink being on the same side of the plate with said stud, said plate being also provided opposite the stud with an indentation, superposed spring leaves on said plate provided respectively with interlocking indentations and bosses, the lower leaf being provided with a boss to engage the indentation of said plate, a plate on top of said leaves, the same being provided with bolt holes, bolts in said countersunk bolt holes and in the holes of the upper plate, nuts on said bolts, said bolts engaging the edges of the spring leaves, bolts through the top plate and spring seat, and nuts on said bolts.

863,604. Power Driven Vehicle. John A. Herzog, Toledo, Ohio, assignor to The De-Luxe Motor Car Company, Detroit, Mich. Filed Dec. 7, 1906. Serial No. 346,723.

1. In a driving axle of floating shaft type, the combination, substantially as set forth, with the depressed beam and the axle arms thereof and the equalizer casing supported by the beam, of guard tubes having their outer ends in abutting connection with the inner ends of the axle arms and having their inner ends clamped to the outer ends of the equalizer casing, whereby the equalizer casing and tubes form a strut in the axial line of the general construction.

863,639. Friction Clutch. Nicholas M. Powell, New York, N. Y., assignor of one-half to Lewis G. Young, New York, N. Y. Filed Dec. 22, 1906. Serial No. 349,203.

1. A clutch comprising a casing, a drum in said casing provided with a shaft which extends beyond one end thereof, a friction member constructed to fit the outer periphery of said drum, a clamping member the end of which is operatively connected to said casing, said friction member being free to slide relative to said drum and clamping member, and means for tightening said clamping member on said friction member and thereby forcing said friction member forcibly in contact with said drum.

863,640. Friction Clutch. Nicholas M. Powell, New York, N. Y., assignor of one-half to Lewis G. Young, New York, N. Y. Filed Dec. 19, 1906. Serial No. 348,511.

1. A clutch comprising a casing, a drum in said casing provided with a shaft which extends beyond one end thereof, a friction section external to said drum, clamping members hinged at one end and external to said section and drum, said friction section being movable circumferentially on said drum and relative to said clamping members, a crank connecting said members at their opposite ends, and provision whereby the crank can be moved to either contact or relax the clamping members to cause the friction section to engage or become disengaged respectively from said drum.

863,680. Power Transmission Device. Edward P. Warner, Chicago, Ill., assignor, by mesne assignments, to Warner Clutch Company, a Corporation of Illinois. Filed Nov. 3, 1906. Serial No. 341,921.

1. A power transmission device comprising a revolving driving member, and a revolving member whose axes align, a series of two or more independent and disconnected circumferential bands connected to one of said members, and means for causing said bands seriatim, to frictionally engage the other member.

863,689. Armored Pneumatic Tire. Henry W. Avery and Wallace S. Judd, Cleveland, Ohio. Filed Feb. 3, 1905. Serial No. 243,-920.

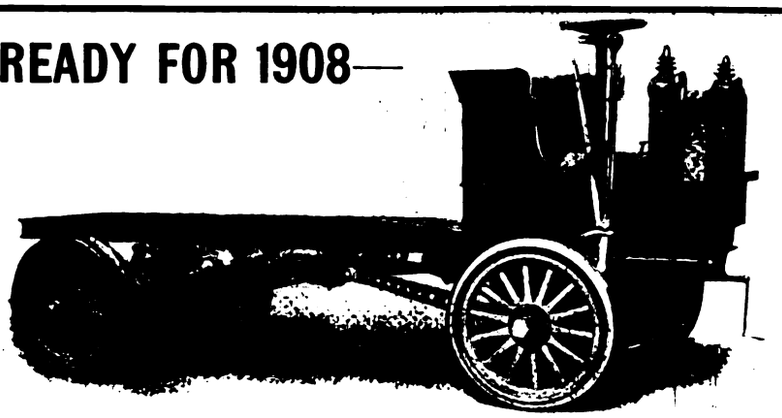
1. As a new article of manufacture an armored tire sheath having embedded in it a spirally wound protecting member whose edges overlap to present a double protection and allow easy telescoping of the parts, the tubular sheath being flattened and curved transversely and longitudinally to correspond to the tire.

863,739. Carburetter. Harry B. Maxwell, Rome, N. Y. Filed Oct. 9, 1905. Serial No 281,871.

1. The combination in a carburetter of a float chamber having an axial passage through the same, a valve located in aud arranged for throttling the said passage at two points, a carbureting nozzle arranged within said passage between the two throttling points and communicating with the interior of the float chamber, means for supplying carburetter fluid to the float chamber, a float, and a valve controlled by the float and controlling the supply to the float chamber, substantially as set forth.

863,916. Speed Regulator for Internal Combustion Engines. Jules Grouvelle and Henri Arquembourg, Paris, France. Filed Sept. 24, 1902. Serial No. 124,649.

An internal combustion engine, having a conduit to supply it with combustible fluid, means for throttling said fluid, a diaphragm and diaphragm chamber, the latter connected with the suction of the engine for producing a partial vacuum in the said chamber, means between and connecting the diaphragm with the fluid throttling means, whereby the former controls the opening of the latter, and means for admitting air to the diaphragm chamber at will for regulating the pressure on the diaphragm, said last named means comprising a pipe open at one end to the atmosphere and at the other end to the diaphragm chamber, a valve device in said pipe consisting of a piston valve which is slidable and axially rotative, and which has axial and transverse ports, the spring which holds said valve normally open, the stem of said piston valve, and means carried by said stem for imparting both a slidable and rotary motion to the valve.



WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—A 1906 Mercedes, 35 h. p., fully equipped with two tops; car cost $12,000. Will accept any reasonable offer. Legitimate reason for selling. Address A. J. KING, 238 N. Broad St., Philadelphia.

Remy Magnetos

which have become so well known to the automobile world and which have gained such great favor among their many users, are now being manufactured in the best equipped plant in the world devoted to the exclusive manufacture of Magnetos. This new factory, a model from the standpoint of efficient arrangement and high class equipment, together with perfected designs which are the results of years of experience in this line of manufacture, makes possible the turning out of the very highest grade ignition apparatus on the market.

For 1908 our line includes a new high tension Magneto without coil, which we build in large quantities and are selling at a medium price. It is simple, small and well made. It can be installed with minimum expense and is a high grade equipment in every respect. We also build Magnetos with coils for double ignition, and alternating and direct current Magnetos for all ignition purposes. It will pay you to investigate our Magnetos before deciding upon your ignition equipment for your 1908 cars.

We will exhibit at both New York Shows and the Chicago Show.

EISEMANN-LAVALETTE

High Tension Magnetos

When a manufacturer equips with Eisemann-Lavalette Magnetos it means that he considers his cars equal in class to the highest grade foreign cars, although there may be a wide difference in price.

The greatest cars of Europe use Eisemann-Lavalette Magnetos exclusively. The Peerless, Packard and other leading American cars equip their entire output with our magnetos and freely admit that it is in a great measure due to the perfection of our instrument that the running qualities of their cars have brought them to their present remarkable popularity.

Magnetos are as permanent an integral part of the motor car construction to-day as pneumatic tires.

The question then is—which magneto?

The answer is—the Eisemann-Lavalette.

The Eisemann-Lavalette, in spite of its admitted superiority, costs, with dual ignition, $50 less to install than any competing make, because of its mechanical points of extreme simplicity, which cannot be duplicated without infringing our patents.

It does away with the cumbersome necessity of placing a timer on the motor with all its attendant wiring complications and expenses. It gives a greater increase in efficiency than any other magneto on the market. It is the most durable instrument of this sort, and it will outwear any car on which it is installed. It is perfect in the matter of timing. This means that it lengthens the life of the motor to a remarkable degree, gives perfection of service under all conditions, which can be obtained in no other way, and is as much a factor in strengthening the performance, and, consequently the reputation of the car as any other one point in its construction.

The strongest point an automobile sales agent can make in offering a 1908 car to the public is the statement that it is equipped with an Eisemann-Lavalette Magneto.

If you make a moderate price car, say $2,000 or $2,500, the use of our magneto will at once class it as a leader at that price. It will enable your agents to give demonstrations fully equal to a $4,000 or $5,000 car, provided the difference in horse power is not too great. It will mean an enormously increased demand for your cars in 1909, with no effort to yourself, and it will also mean that the best automobile agents will be more apt to solicit making connections with you on your own terms. They know the value of our instrument and we are taking strong steps to see that they do not forget it.

The Eisemann-Lavalette Magneto carries its coil in a separate box, thus providing ample space for a heavy thickness of insulation. The space is so ample that we would increase this insulation provided there was any advantage to be gained by it. Barring accidents, it is impossible for short-circuiting to occur. In the very rare cases where short-circuiting has occurred it has been a matter of slight expense and a few minutes of time to install a new coil in this separate box, thus making the instrument absolutely as good as new. When short-circuiting occurs in this separate box, which is a safe distance from the armature, the magneto is entirely unaffected.

In competing makes, which claim to be as good as the Eisemann-Lavalette, the coil is carried in the space inside the armature. This space is so small that the insulation is, of necessity, very thin and inadequate. With inadequate insulation short-circuiting is bound to occur sooner or later, and when it does occur the entire magneto is out of commission and must be replaced by a new instrument or sent to the factory for repairs.

When you sell a man a car equipped with an Eisemann-Lavalette Magneto you can guarantee him freedom from ignition troubles. Our guarantee to you stands behind yours. By using our instrument you greatly reduce his cost of upkeep.

Are you dissatisfied with your present ignition system? We have engineers, specialists in WHAT YOU WANT TO KNOW. We will gladly send one to you to work out your ignition problem for you. Better still, come and see us at the automobile shows. We are exhibiting at all of them.

Grand Central Palace, space F. Madison Square Garden, spaces 120 and 121.

¶ Why Solar Gas Generators Always Satisfy. ¶ Because they embody the only correct principle of gas generation (wick feed) making flooding impossible. ¶ Aremade round so as to enable each part to be drawn from one piece of heavy sheet brass (not four pieces soldered together). ¶ This absolutely removes the possibility of leakage and produces a steady supply of never failing gas.

BADGER BRASS MFG. CO., Kenosha, Wis.
Eastern Branch, 11th Ave., 36-37th Sts., New York City

It was found that

3 Out of Every 4 Tourists
had used
Warner Auto-Meters

Yes, sir; of the 48 cars that finished at New York in this year's Glidden Tour, exactly 36 carried Warner Auto-Meters. Just think of that! Three times as many Auto-Meters were used by these experienced motorists as there were of all other speed-and-distance indicators combined!

This sweeping victory for Warner Auto-Meters, followed last year's equally creditable performance in the Glidden Tour, and the recent notable triumphs in the Chicago Sealed Bonnet Contest and the Boston Endurance Race, establish beyond the possibility of a doubt that the Warner Auto-Meter is the only speed-and-distance indicator that can be depended upon to do the work right at all times and under all conditions.

Accurate as a Watch—Reliable as a Compass

Warner Auto-Meters are made on the proven-successful magnetic principle. They're just as reliable and durable as a mariner's compass. No matter how rough the road, you can tell at a glance exactly how fast you are going. The arrow never flutters or bobs back and forth. The Warner Auto-Meter is as accurate as a watch.

You ought to have an Auto-Meter on your machine—it doubles the pleasure of autoing, helps you to control your machine and frequently saves embarrassing situations in the police court.

You'll notice the handsome little Auto-Meter on most of the best cars. Take a look at it; inquire about it—nearly all automobile dealers sell Auto-Meters.

Write us the name and power of your car, and we'll tell you just what it will cost you to put an Auto-Meter on the dashboard.

Better than any Speed Indicator in the World

1908 Jones Speedometer

is to speed indicators what the highest type of Limousine is to the cheap Runabout—with one exception—the cost. The Limousine will cost ten times more than the Runabout, but full value is received. Many Speed Indicators cost as much as the Jones—but they are in the Runabout class and should be sold as such.

The Jones is the pioneer speed indicator. It is the accepted standard speed indicator. It is used in this country and Abroad by the Police Departments as a means for timing motor vehicles for reason of its accuracy. It won the Royal Automobile Club's Reliability award, finishing the Contest without one mark against its mechanical construction, receiving the Gold Medal. It was used by S. F. Edge on his Napier Cars when he made the World's most remarkable record on the Brooklands Track, London, England; 1,588 miles; 1,310 yards in 24 hours. 66 miles an hour means 4,039,200 revolutions of the speedometer shaft. Isn't this more than a demonstration of Jones' staying qualities?

The Jones guarantee for Reliability and Accuracy is stronger than that of any other manufacturer. From every point of view the Jones is the best in the World.

Exhibit at both Grand Central Palace and Garden Shows.

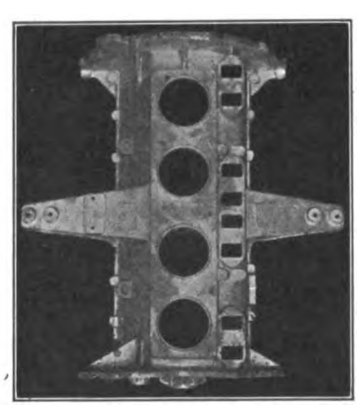
The Springfield Motometer

Presents New and Valuable Features

The Maximum Hand: Marks highest speed attained. Resets instantly. Can be disconnected in a moment.

New Easy Reading Dial—Big plain figures. Fired Enamel. Reads from the tonneau.



Spring Steel Reinforce on each end of the driving shaft. Compels easy curves and smooth running. Far better than gears.

Non-Clogging Pinion. Mud proof. Will not hold mud. A rainy weather necessity.

With these additional excellences, the Motometer is more than ever "The Speedometer for Service."

WATCHES ARE NOW MADE in America, shipped to Switzerland and re-shipped to America. WHY? Well, Americans think they want hand made things. That they really prefer the more accurate creation of the machine is proven by their purchase of "Swiss" time pieces made in Massachussetts. FORD automobiles may yet be reshipped to American buyers from France.

"WHITNEY" CHAINS

January 1, 1907 to November, 1, 1907, conditions as follows:

On January 1, 1907, we were renting about 38,000 square feet of floor space in a building not adapted for our growing business. At the same time we were giving much attention to our new buildings which were under construction, and not completed until July, 1907. During this period we moved our entire equipment to our new factory and for a number of weeks were obliged to operate machinery in both plants. We also carried on important experiments and constructed much special apparatus for our new factory. While thus handicapped we could not fully meet the increasing demand for "Whitney" Chains.. Nevertheless, we succeeded in shipping a greater number than ever before for an equal period of time.

"WHITNEY" CHAINS

November 1, 1907, to December 31, 1908, conditions as follows:

New fire-proof factory, one of the best, strongest and safest in the country. Floor space over 70,000 square feet. Best of light and excellent conditions for employes. Location one of the best in Hartford. Private side-track connecting with main line between New York and Boston. Land area over ten acres. Large increase in new machinery and tools. Improved methods. Inspection system more rigid than ever. Greater accuracy. Increased strength by the use of new materials and improved treatment. Greater durability. Better finish.

Rainier

"The Pullman of Motor Cars"

GUARANTEED FREE OF REPAIRS FOR ONE YEAR

OUR NEW PLANT, FROM WHICH IS COMING THE 1908 "MODEL D," TO ADD TO RAINIER FAME.

SOUND business economy demands that in selling a car under our original and distinctive guarantee, "Free of repairs for one year," that the chief expenditure must be at the beginning, that is, at the factory and, in material and construction, instead of in the local repair shops: Therefore our new factory at Saginaw, Mich.

The new plant comprises sixty acres of ground, with spacious brick buildings, in which every piece of machinery is new and specially designed for building the RAINIER. Nothing has been omitted that would tend to insure accuracy and superlative quality. James G. Heaslet, the original designer of RAINIER cars, is responsible for the 1908 RAINIER, which is higher-powered and more strikingly than ever a "Pullman" in quality and finish. "Quality, not quantity," is our factory watchword, and the 1908 output has been limited to 300 cars.

Rainier

"The Pullman of Motor Cars"

GUARANTEED FREE OF REPAIRS FOR ONE YEAR

1908 "Model D," 45-50 H. P.

SPECIFICATIONS

ENGINE—Rated H. P., 45-50; four cylinders, vertical, cast in pairs; 5-inch bore, by 5¼-inch stroke; cylinders hard gray iron castings, accurately ground to size; pistons light but rigid, ground to fit; valves on opposite sides, mechanically operated, all interchangeable; cams forged integral with shafts; crank shaft nickel steel forging, with bearing surface ground; main engine bearings and connecting rod bearings of finest babbitt metal, enclosed in bronze cases, a construction the same as that in the highest priced imported cars.

IGNITION—Make-and-break system, with Simms-Bosch, low tension magneto, but with a greatly improved and simplified mechanical sparking device, insuring accurate timing and minimum need for adjustment; one upright ignition shaft in place of four.

LUBRICATION—Positive feed mechanical oiler, driven by gear from the cam shaft, provides for engine bearings, magneto and pump shaft; Cylinders and pistons fed by splash system.

CARBURETER—Improved automatic type, having auxiliary air control on dash; feed by gravity flow through trap and screen; Capacity of gasoline tank, 20 gallons, two in reserve.

COOLING SYSTEM—Extra large radiator with fan running mounted on a pedestal over the timing gear case; fan belt runs vertically, driven by a pulley directly on the crank shaft.

CLUTCH—Multiple disc, alternate bronze and steel plates, running in oil; very sensitive touch.

TRANSMISSION—Selective type of gears, four speeds forward and one reverse, direct drive on third speed; shafts and gears nickel steel, and shafts mounted on imported ball bearings; counter shaft located below driving shaft, enabling use of sealed bearings, thereby avoiding oil leakage.

PROPELLER SHAFT—Nickel steel, with new and improved universal joints; driving pinion forged integral with the shaft.

REAR AXLE—Driving axle of floating type, with hubs mounted on tubular axle which carries the weight of the car; drive is bevel gear through clutch driven hubs; driving gear housings manganese bronze, while differential case is drop forging.

BRAKES—Hand and foot brakes, mounted on rear wheel drums, both interior expanding; hand brake pulls towards operator.

FRONT AXLE—Drop forging, manganese steel, I beam section; wheel hubs mounted on imported annular ball bearings.

WHEELS—36-inches with 1¾-inch spokes, second growth, grade A hickory.

TIRES—Rear 36 x 4½-inch, front 36 x 4-inch. Make optional.

FRAME—Pressed nickel steel, with 2½-inch drop forward of rear axle.

CONTROL—Spark and throttle on steering wheel, with stationary segment and foot accelerator pedal.

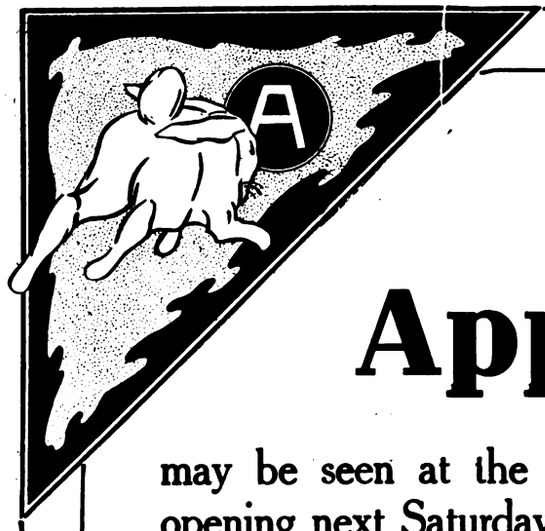
MUFFLER—Cut-out on all cars.

WHEEL BASE—119 inches.

SPRINGS—Front, semi-elliptic; rear, improved type of platform or three point suspension; size of springs greatly increased; quality of spring steel is most expensive and finest obtainable.

BODY—Double side entrance, seven passenger capacity, full aluminum, ironed for top; extra seats can be folded or removed instantly.

EQUIPMENT—Two acetylene head lights, generator, two oil side lights, oil rear light, large horn, brass coat rail, brass foot rest, tire carriers, trunk rack, tool box on step with full set of tools, including pump, jack and tire repair kit.



WEIGHT—2,850 pounds.

PRICE—$4,500.

"Famous Apperson Cars"

may be seen at the Madison Square Garden Show, New York, opening next Saturday, November 2d.

The car with a reputation and fifteen years of experience in automobile construction behind it.

Four-Cylinder and Six-Cylinder cars rightly constructed from the right materials.

Roadsters at $2750.

Touring Cars at $3000 to $5000.

Runabouts at $2750 to $5000.

We build automobiles that are mechanically, commercially, practically and economically correct. Many people know this by experience. All interested parties, users or dealers, are cordially invited to call at our exhibit at the Garden, Space 12, where we will be prepared to demonstrate and prove all of our claims for the "FAMOUS APPERSON CARS."

An interview or correspondence with Dealers from unoccupied territory is invited.

THE MARMON

"A Mechanical Masterpiece"

The Easiest Riding Car In The World

THE wives of Marmon owners are its staunchest friends. The Marmon rides so easily, takes the rough roads so gently that a woman can tour in it all day without exhaustion and without injury to her health. No other car, foreign or domestic, even approaches it for comfort. The reason for this unrivalled ease of motion is readily apparent to any one who investigates.

¶ The Marmon offers a number of just such striking advantages, not to be found in any other car.

¶ At the same time it offers all the advantages of beauty, quality, repute and ability, to be found in any other car at any price.

¶ The exclusive mechanical excellence of the Marmon demands your careful consideration.

¶ Model H Touring Car, 40-45 H. P., $3500; Model H Roadster, 40-45 H. P., $3500; Model G Touring Car, 35-40 H. P., $3000.

¶ For full description of all 1908 Models, address Dept. 16.

While you are looking up the advanced ideas in construction at the Show, stop at the Haynes booth and

1. See a high-powered car without side-chains.

A unique principle—the Haynes bevelled-sprocket-and-roller-pinion—makes shaft drive perfectly feasible and practical even on the 60 H. P. Model U, with its long wheel-base and great power. The abolition of the dirty, noisy stretching side-chains alone is sufficient reason for a selection of the Haynes.

2. See the way the Haynes universal joints are made practically unbreakable, with a floating cube of solid steel taking the wear instead of the usual slender pins.

3. See the Haynes change gear system—high speed to low without a jar or a possibility of stripping or burring the gears. (A lady can handle it.)

4. See the unique Haynes Master Clutch which works like a brake, metal to metal. It makes shocks impossible, it won't wear out, and there is no leather to renew.

5. See the stock model Haynes that represented America in the Vanderbilt Cup Race where these and other unique devices received one of the hardest tests ever given a stock chassis.

6. See the new member of the Haynes family—the Model W, 45 H. P., with a new body design, $3,000, ranking in power and size between the 30 H. P. Model S at $2,500, and the 60 H. P. Model U, at $3,750.

The Haynes factory was the first automobile factory built in America, and the Haynes cars for 1908 are the fruit of fourteen years of brilliant but conservative progress as pioneers in original and successful invention.

THOMAS

THE E. R. THOMAS MOTOR CO. presents four styles of chassis and nineteen styles of bodies

Thomas 4-20 Town Car

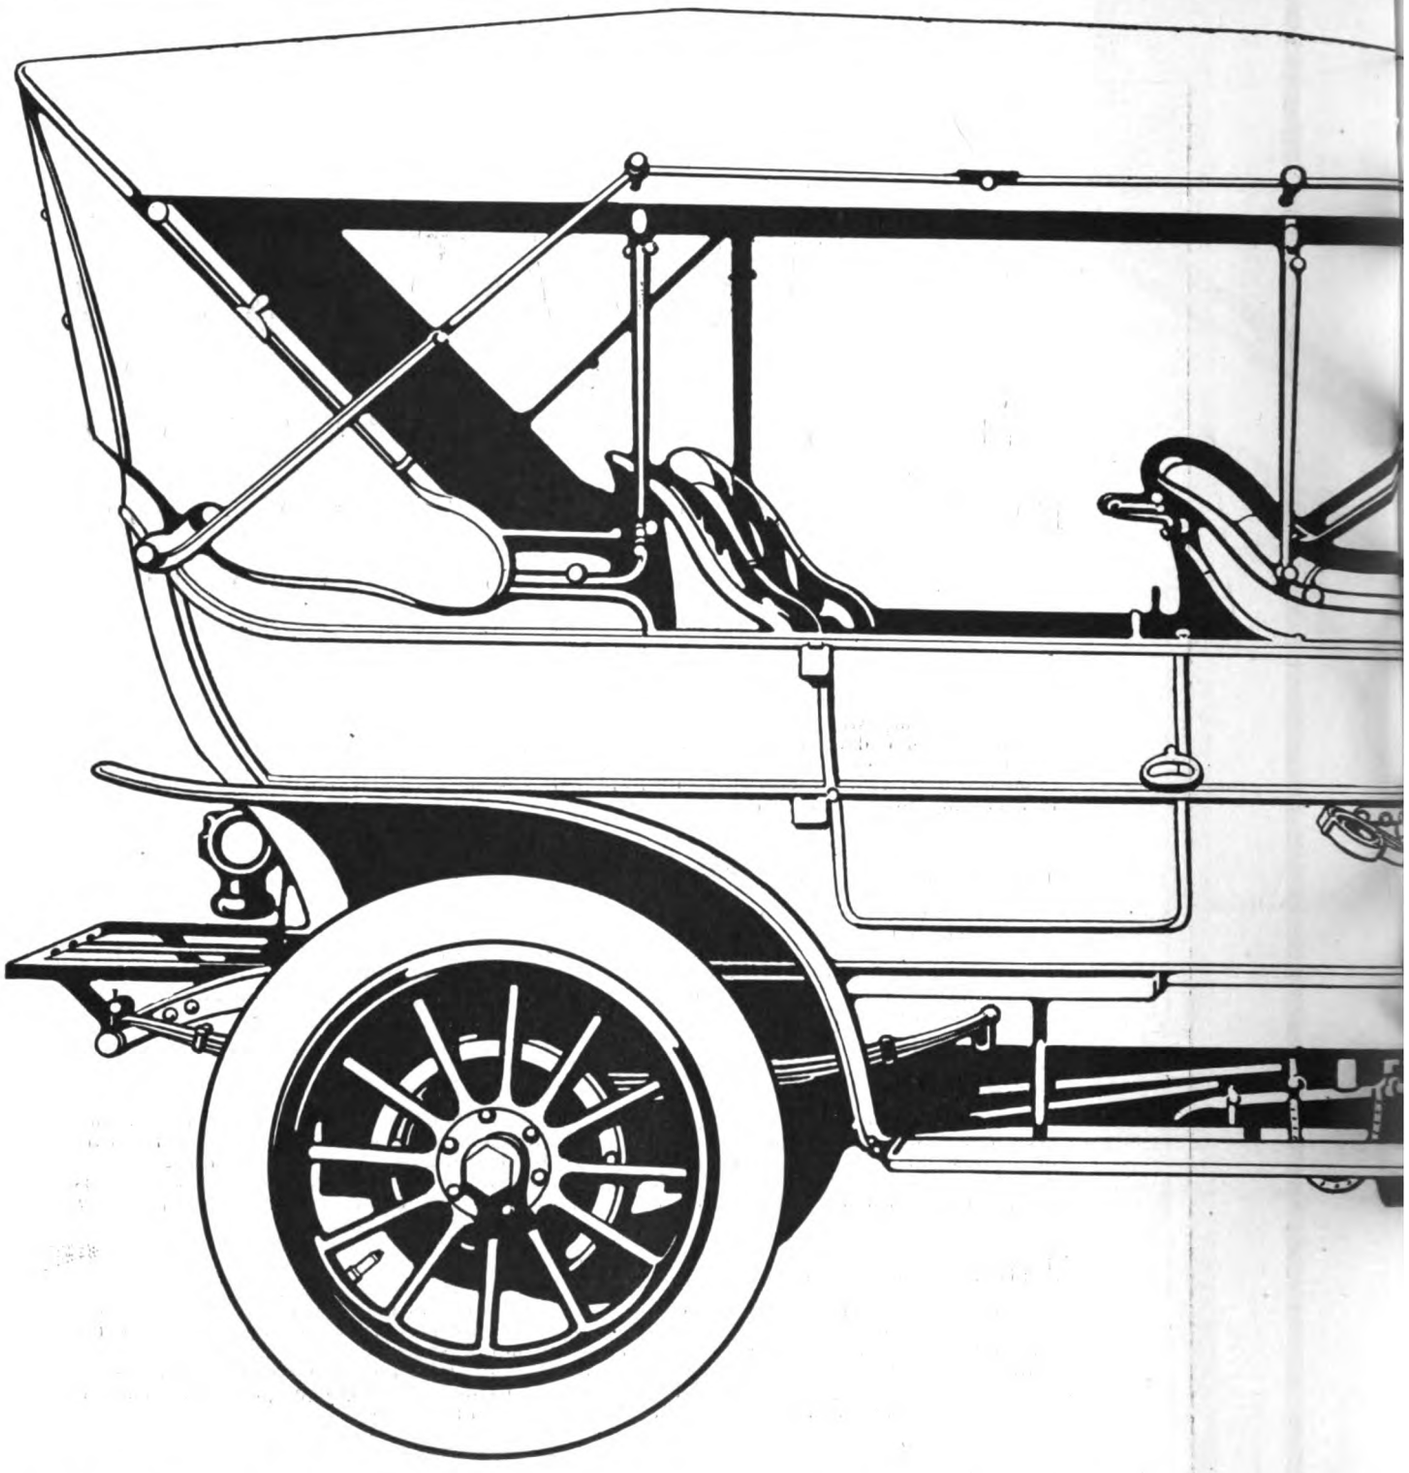
Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, $3,000 to $3,250.

Thomas 4-40 Detroit

A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse at a much lower price, shaft driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, $2,750 to $3,750.

Thomas 4-60 Flyer

The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, landaulet and limousine bodies. Prices, $4,500 to $5,700.



Thomas 6-70 Special

This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, $6,000 to $6,900.

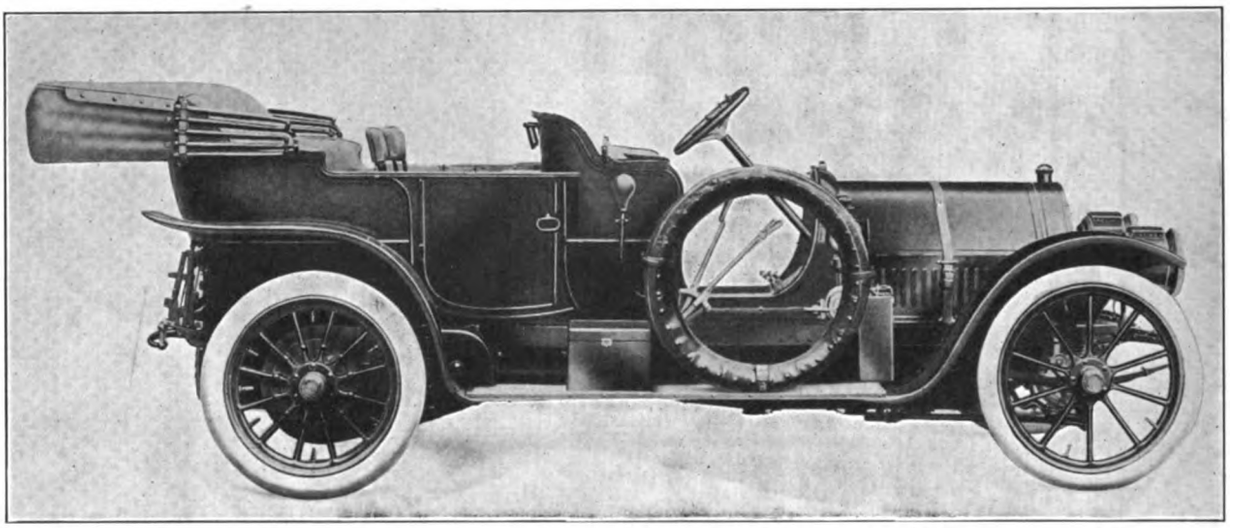
THE Great Arrow Six-Cylinder Car is not theory. It is fact. A single experience in a six-cylinder Great Arrow will prove that vibration has been reduced to a minimum. This comfort, this added touch of luxury to a car already most efficient in construction, makes the 1908 Great Arrow six-cylinder the ideal car for the man who wants everything.

Digitized by Google

THE GREAT ARROW SIX-CYLINDER

The best mechanical description ever written will not be so convincing to you as a single hour's demonstration.



HERE ARE THE 1908 TOURING CARS

4-cylinder Great Arrow 30 H. P., Price $4000
4-cylinder Great Arrow 40 H. P., Price $5000
6-cylinder Great Arrow 40 H. P., Price $5500
6-cylinder Great Arrow 60 H. P., Price $6500

1908 Announcement

Pope-Toledo Type XVII

Its keynote of design is close attention to those fine details and niceties of construction which enhance the comfort and convenience of the user in quietness, freedom from vibration, cleanliness, speed, luxurious accommodations and appointments, ample carrying space for luggage; an entire separation of the mechanical part of the car from that used by the passengers; two separate and independent systems of ignition on two separate sets of spark plugs, practically eliminating all electrical trouble, encased noiseless Chrome Nickel Steel chains; castled nuts and split keys to every mechanical fastening; an enclosed detachable pan under the whole car to prevent the entrance of dirt or water to the propelling mechanism; an entire absence of brass parts, blued steel being used on all parts handled by the chauffeur; all handles and fittings in that part of the car occupied by the passengers covered with fine seal leather; double extension robe rail, folding detachable seats, dress-suit cases for the ladies' apparel and pockets for the gloves, goggles and other articles.

We take great pleasure in announcing to our dealers and many friends of the Pope-Toledo Car that our new models are

When you pay $3000 to $5000 for an Automobile, Mr. Business Man, you get a pretty *good car*—but you don't get your *money's worth*

You don't because today most automobile *values* bear the same relation to automobile *prices* that *bicycle* values and prices bore to each other *twelve years* ago.

You paid $125.00 for a good wheel *then*. Today you can buy a *better* one for 60 per cent *less*.

Before you pay $3000.00 to $5000.00 for an *automobile*, find out what sort of a car the *Mitchell* is at *$2000*.

Don't take it for granted that $2000 *can't* buy as good automobile value.

Prove that it *can;* it isn't a bit of trouble. Put *higher* prices on the *defensive*. Do it this way—

Try the Mitchell—any agent anywhere will be *glad* to "show you" a combination of style, finish, construction and performance in the Mitchell new models, the superior of which hasn't been "shown" in any car made today regardless of price.

See the Mitchell at the show—scrutinize it most critically—leave your business card and address and state the most convenient time to call for you.

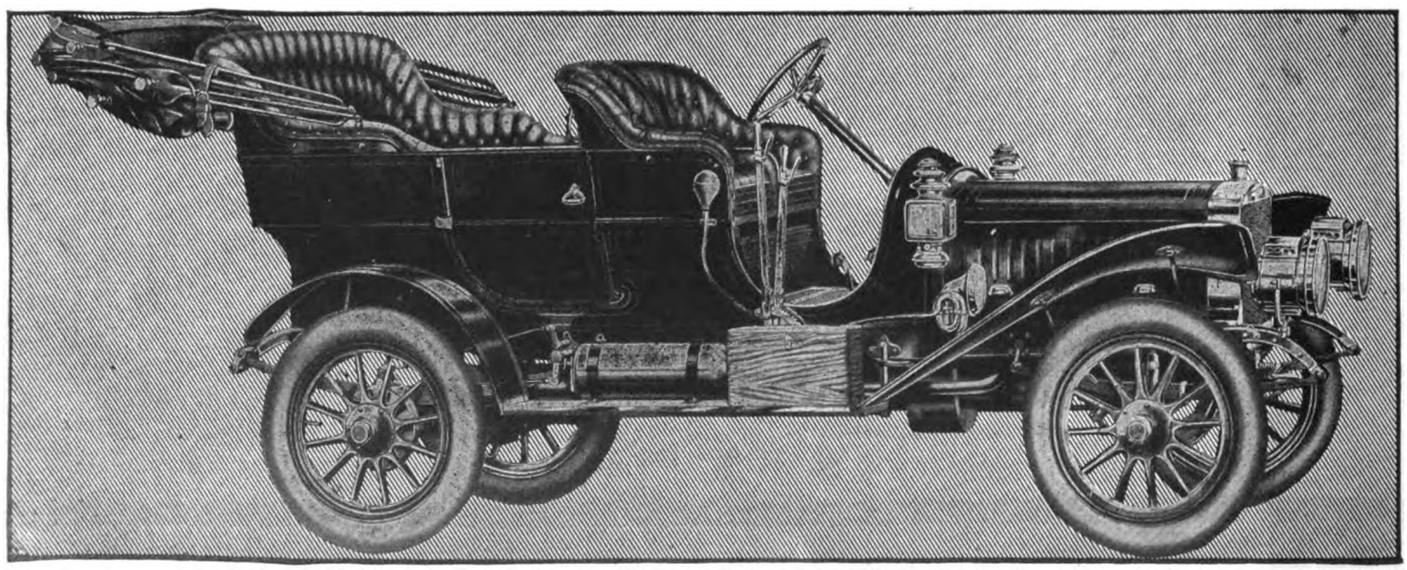
Then we'll send a car around and show you a *silent argument* that will instantly appeal to your business judgment and *convince* you—a silent argument the equal of which no *salesman* ever will be capable.

The Mitchell will *prove* value equal to that of any car. The Mitchell will *decide* the question of automobile prices and value once and for all time.

Isn't saving $1000 or $3000 on an automobile which *proves* itself right *worth considering*, Mr. Business Man?

If you saw a chance to save $3000 for your business, wouldn't you go to at least $500 worth of trouble to do it?

To save $3000 on your automobile, which is worth $3000 to you *personally*, is no trouble *at all* and doesn't cost *anything*.



You simply telephone any Mitchell agent that you are interested (no obligation on your part) and want a demonstration.

Think it over, Mr. Business Man. Do you know a single good, business-like reason *why* you should pay more than $2000 for an automobile? Prove that there *isn't* any by writing us or the nearest agent for names of many satisfied users of the Mitchell who have driven their cars thousands of miles over all kinds of roads and hills, and have encountered every known road test that makes or breaks a car. Let them tell you facts in their *every-day* experience which proves the Mitchell to be the most economical car to *keep* as *well* as to buy.

National

MOTOR CARS

"THE ALL BALL-BEARING CARS"

The 1908 Line consists of

Two 4-Cylinder and Two 6-Cylinder Models

in Touring Cars, Limousines and Roadsters. Each equipped with **National Ball-Bearing Motors**

The entire line embodies the tried and proven NATIONAL type of construction, refined and perfected in all details to the highest possible degree.

National Model K, 4-cylinder, 4⅞x5,	$3,500.00	National Model R, 6-cylinder, 4½x4¾,	$4,200.00
National Model N, 4-cylinder, 5x5,	$3,700.00	National Model T, 6-cylinder, 5x5,	$5,000.00

Each machine carries 7 passengers comfortably.

GOODYEAR LEADS

A count of the automobiles equipped with Quick Detachable Rims at the Grand Central Palace Show, just held in New York City, shows the following result:

Goodyear Universal Rims on 27 Cars

Marsh Rims on 19 Cars
Goodrich Rims on 17 Cars
Midgley Rims on 8 Cars
Fisk Rims on 2 Cars

The Goodyear Universal Rim has been adopted exclusively for 1908 by the following manufacturers, representing an output approximating 64,000 rims, viz:

The Bartholomew Co. (Glide)
Buick Motor Co
Chalfonte Motor Car Co.
Crawford Auto Co.
De Luxe Motor Car Co.
Dolson Auto Co.
Jackson Auto Co.
Motorcar Co. (Cartercar)
Pierce Engine Co. (Pierce-Racine)
Reo Motor Car Co.
The Smith Auto Co.
Waltham Mfg. Co.
York Motor Car Co.

See it and the Goodyear Tire demonstrated at the Garden Show or any branch. Tire off or on in less than a minute.

BETTER VALUE THAN ANY OTHER PLUG MADE

The "Breech-Block" Plug

INSTANT REMOVAL AND REPLACEMENT WITHOUT TOOLS

Four "Breech-Block" plugs can be opened, cleaned and closed in Sixteen Seconds by the watch.

A Gentlemens' Spark Plug

Saves

time, tools, temper and trouble;

Insures

cleanliness, freedom from the "fussed-up" uncomfortable condition consequent of working around a hot engine and, best of all, insures comparative freedom from faulty ignition.

Breech-Block Plugs

mark a distinct advance in spark plug construction. Made of the finest materials, including genuine German porcelain, in our own factory (one of the largest in the country devoted to the manufacture of fine mechanical specialties), they fulfill the purpose for which they are designed better than has heretofore been possible.

Specify them on your cars.

Morgan & Wright Tires are ever ready to supply the Motorist with proof conclusive that there is lots of contentment stored away in good tires.

Some Motorists don't know this—that's because they don't specify good tires.

MORGAN & WRIGHT TIRES ARE GOOD TIRES

FOR CLINCHER

FOR DUNLOP
(Note rubber filler in clincher on left.)

The Improved Midgley Rim, illustrated above, accommodates every make of Clincher or Dunlop tires, as well as every type of mechanically-fastened tires, except one. Standard measurements thruout, including inside diameter. Solid bead.

MORGAN & WRIGHT, DETROIT

Madison Square Garden Show—Space 78.

Digitized by Google

The Tire of the Day

Wearing quality—that's what the Motorist looks for in the tire he buys.

But there's absolutely no positive way of telling what's in the tire in the way of service until he has tried it.

The name of the maker of that tire—stamped on his product—is the *only* thing by which the purchaser can be governed.

The tire which lasts longest in actual service and gives the owner the least trouble is certainly the *best* tire—and the *cheapest*—no matter what its *first* cost.

And we want to prove to you that the

G & J
Oval Raised Tread Tire

is not only the *best made* automobile tire of today—but it will outwear and outlive all other makes. Therefore we want to show you that it will be cheaper if you buy G & J Tires.

There are several reasons for the above assertions.

The G & J Oval Raised Tread Automobile Tire is made of the best rubber and fabric which can be put into a tire.

We are the only sole manufacturers of automobile tires in America.

The G & J Oval Raised Tread Tire is the culmination of over fifteen years' experience and effort to produce the *perfect* automobile tire.

The G & J Oval Raised Tread was designed solely to meet the demands for a tire that would stand the wear and tear of strenuous service on American roads.

The G & J Oval Raised Tread Tire gives most wearing surface—where it is most needed; it makes skidding less liable—and equipped with the famous Midgley Tread, as we build them when desired—it makes *all* skidding and slipping *absolutely impossible.*

The G & J Oval Raised Tread Tire you will find more resilient and durable than any other make of tire you ever tried.

But you *must* try to prove all this true. Will you do so?

Good thing to remember in equipping your car is that we can supply you with the new 1908 Universal Midgley Rim which will fit any Clincher or Dunlop Tire.

EISEMANN-LAVALETTE

High Tension Magnetos

When a manufacturer equips with Eisemann-Lavalette Magnetos it means that he considers his cars equal in class to the highest grade foreign cars, although there may be a wide difference in price.

The greatest cars of Europe use Eisemann-Lavalette Magnetos exclusively. The Peerless, Packard and other leading American cars equip their entire output with our magnetos and freely admit that it is in a great measure due to the perfection of our instrument that the running qualities of their cars have brought them to their present remarkable popularity.

Magnetos are as permanent an integral part of the motor car construction to-day as pneumatic tires.

The question then is—which magneto?

The answer is—the Eisemann-Lavalette.

The Eisemann-Lavalette, in spite of its admitted superiority, costs, with dual ignition, $50 less to install than any competing make, because of its mechanical points of extreme simplicity, which cannot be duplicated without infringing our patents.

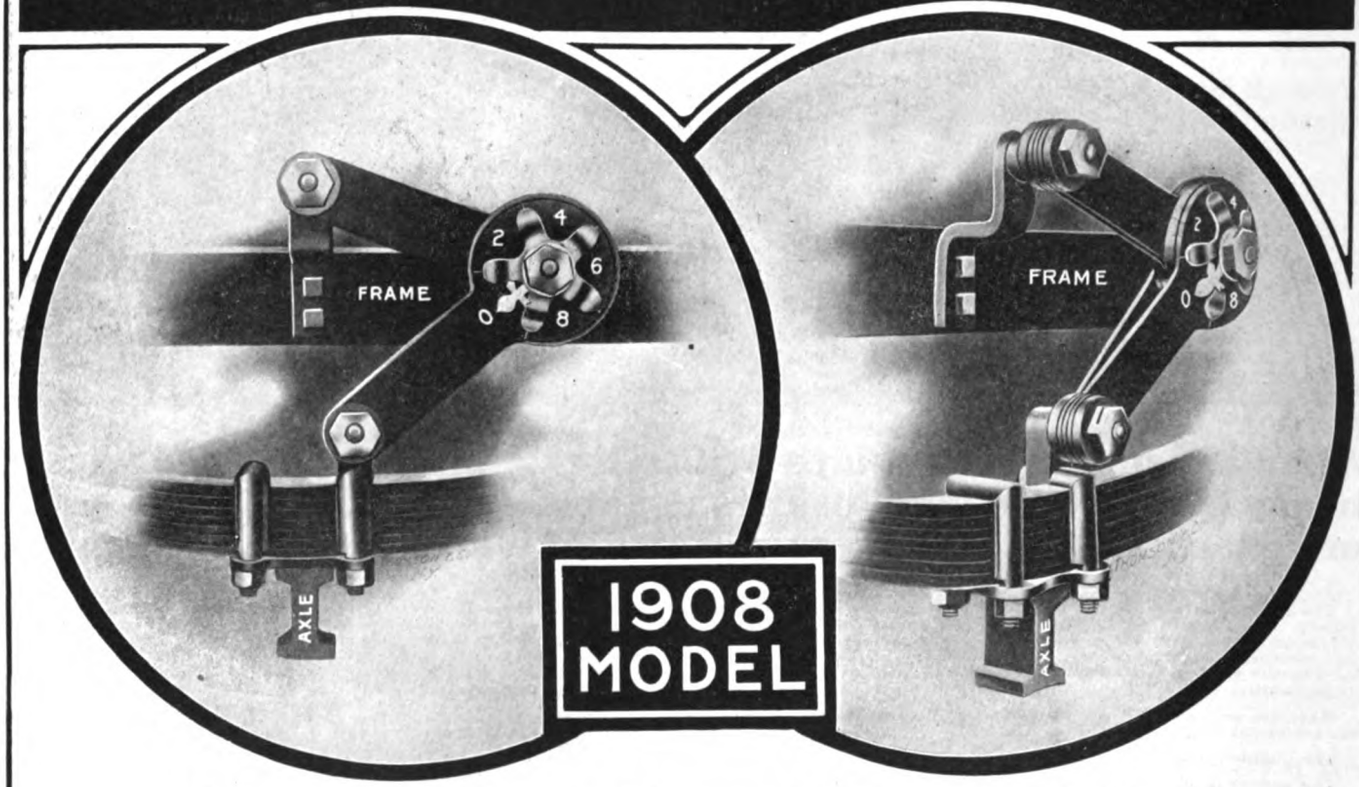
It does away with the cumbersome necessity of placing a timer on the motor with all its attendant wiring complications and expenses. It gives a greater increase in efficiency than any other magneto on the market. It is the most durable instrument of this sort, and it will outwear any car on which it is installed. It is perfect in the matter of timing. This means that it lengthens the life of the motor to a remarkable degree, gives perfection of service under all conditions, which can be obtained in no other way, and is as much a factor in strengthening the performance, and, consequently the reputation of the car as any other one point in its construction.

The strongest point an automobile sales agent can make in offering a 1908 car to the public is the statement that it is equipped with an Eisemann-Lavalette Magneto.

If you make a moderate price car, say $2,000 or $2,500, the use of our magneto will at once class it as a leader at that price. It will enable your agents to give demonstrations fully equal to a $4,000 or $5,000 car, provided the difference in horse power is not too great. It will mean an enormously increased demand for your cars in 1909, with no effort to yourself, and it will also mean that the best automobile agents will be more apt to solicit making connections with you on your own terms. They know the value of our instrument and we are taking strong steps to see that they do not forget it.

The Eisemann-Lavalette Magneto carries its coil in a separate box, thus providing ample space for a heavy thickness of insulation. The space is so ample that we would increase this insulation provided there was any advantage to be gained by it. Barring accidents, it is impossible for short-circuiting to occur. In the very rare cases where short-circuiting has occurred it has been a matter of slight expense and a few minutes of time to install a new coil in this separate box, thus making the instrument absolutely as good as new. When short-circuiting occurs in this separate box, which is a safe distance from the armature, the magneto is entirely unaffected.

In competing makes, which claim to be as good as the Eisemann-Lavalette, the coil is carried in the space inside the armature. This space is so small that the insulation is, of necessity, very thin and inadequate. With inadequate insulation short-circuiting is bound to occur sooner or later, and when it does occur the entire magneto is out of commission and must be replaced by a new instrument or sent to the factory for repairs.



When you sell a man a car equipped with an Eisemann-Lavalette Magneto you can guarantee him freedom from ignition troubles. Our guarantee to you stands behind yours. By using our instrument you greatly reduce his cost of upkeep.

Are you dissatisfied with your present ignition system? We have engineers, specialists in WHAT YOU WANT TO KNOW. We will gladly send one to you to work out your ignition problem for you. Better still, come and see us at the automobile shows. We are exhibiting at all of them.
Grand Central Palace, space F. Madison Square Garden, spaces 120 and 121.

TRUFFAULT-HARTFORD SHOCK ABSORBER

"Renders Real Rough Road Relief"

¶ The spring action of a car affects its smooth running qualities. Proper control of the springs prevents excessive oscillation, which insures LESS WEAR and TEAR, LONGER LIFE OF TIRES, GREATER SPEED AND GENUINE COMFORT.

¶ This control of the springs can be secured only by the use of TRUFFAULT-HARTFORD Shock Absorber—the device that has made SAFE, ECONOMICAL AND COMFORTABLE automobiling possible.

¶ In the 1908 model we believe that we have practically obtained perfection.

¶ A distinctly new feature has been added, consisting of a regulating dial with indicator, making it possible for even a novice to obtain a perfect and uniform adjustment to suit the exact requirements of the car as measured in terms of its gross weight, and easily secure the maximum benefit.

¶ The Truffault-Hartford is the only spring retarding device manufactured with a regulating dial. It is automatically lubricated, absolutely dust and water proof, interchangeable, practically indestructible and *fully guaranteed.*

¶ Twenty prominent automobile manufacturers now use the Truffault-Hartford Shock Absorber exclusively as part of the regular equipment of their cars.

¶ Write for our "Ruff Road" booklet, Dept. I, or a demonstration will convince you—see us at the shows.

THE BRAMPTON CHAIN

The **stongest** chain in the world; made of **self-hardening steel** with large spun rivets, chamferred side plates (no sharp edges). All parts of this chain are polished and fit the sprockets (which are properly cut) without friction.

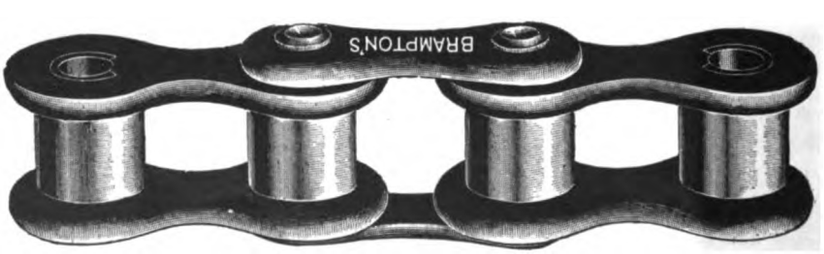
Imitation, What's the Definition?

Some chain manufacturers have copied the Brampton chain as near as they could. Their chain somewhat resembles the Brampton chain in appearance, but they have been unable to copy the material **(self-hardening steel).**

No change has been made in the construction of the Brampton chains in the past ten years. **What does that signify?**

Our price list is not copyrighted and our competitors are welcome to use it. One of them has done so, using our numbers, sizes, prices and descriptive matter.

It is therefore easy to be seen that the Brampton chain is The One Standard of the World.



All Brampton Chains are stamped with the name Brampton on each outside link; Beware of the imitators and get the genuine Brampton.

PRICES THE SAME AS AMERICAN-MADE CHAINS.

We are the Sole American Agents. Catalog on request.

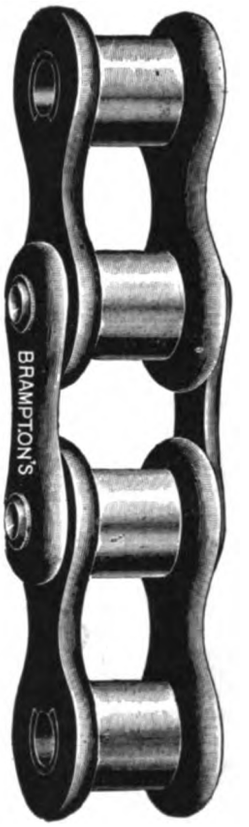
Price! That's The Rub

The price of the CELEBRATED BRAMPTON CHAINS, (the best in the world) is the same as the American made chains.

Large Sales

make it possible for us to import the CELEBRATED BRAMPTON CHAIN from England (paying freight and duty) and sell it at the same price at which the several other automobile chains are sold to manufacturers, jobbers, dealers and users.

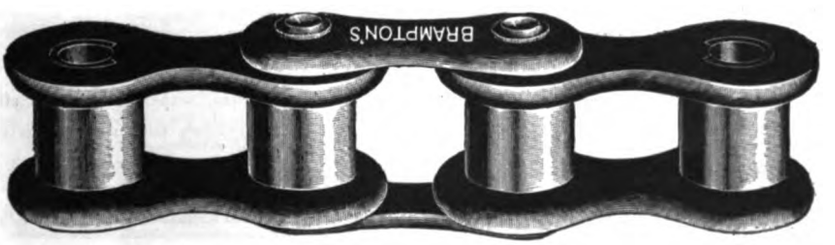
Price Being Equal



What would you do?

The manufacturers of American motor cars will fit the BRAMPTON CHAIN to your car if you order that way—no extra cost to either you or the manufacturer.

We carry in stock all BRAMPTON Standard Sizes to fit American and Foreign cars.



PRICE, the same—QUALITY, that's DIFFERENT.

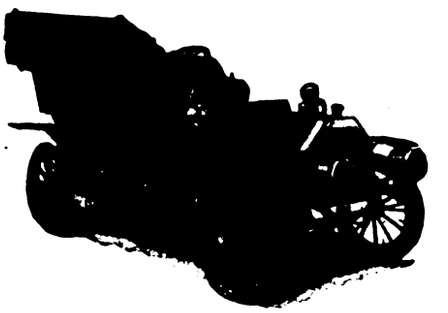
DRAGON

1908 Roadster

35 H. P., $1850

Four 4½ x 4½ inch cylinders, cast in pairs; valves on one side; progressive type transmission, located on rear axle; I-beam drop-forged front axle, roller-bearing rear axle; 96-inch wheel base; drop frame of pressed steel; storage battery ignition; speed up to 55 miles an hour; weight 1,800 lbs.; cone clutch, leather-faced; brakes, 14-inch drums, metal to metal internal and external; ball-bearing front axle and gear box; Diamond tires 32 x 3½ inches. The price includes full equipment of five lamps, horn and tools.



"The Happy Medium Car"

is a phrase that fits the Dragons to a T. They embody only details approved by sound engineering precedent and justified by actual work on the road.

The ambition of the Dragon builders is to give Dragon buyers the best service they can get anywhere for anything like the Dragon prices—long life for the car and small expense for upkeep.

The Dragon Roadster is simple, strong, light and speedy—55 miles an hour if you want it. And it looks the part.

The Dragon Touring Car of 1907 was the best of its class for that year. It needed only the few refinements we have made to make it the best of its class for 1908.

24-26 H. P., five passengers, full elliptic springs in rear, wonderfully easy riding, silent shaft drive, double hub brakes—$2,100 f. o. b. Philadelphia.

The 1908

Cleveland

40-45 H. P.
AT
$3,500

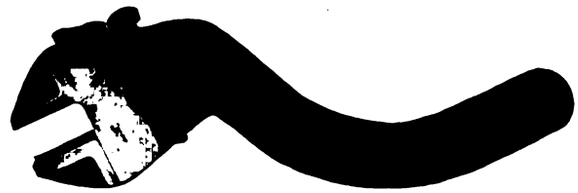
presents more really remarkable features than you will find in any other car now offered, no matter its country or price.

¶There isn't a detail that a perfect car should have that is missing from the 1908 Cleveland. There isn't a detail that is unworthy of absolute motor car perfection that is present in the 1908 Cleveland. Every feature could be made a special "selling feature."

¶Such features, for instance, as ignition, lubrication, brakes, and a novel ratchet-sprag, you will find distinctively new. But its many features are so notably in advance of any car so far built that you will have to examine it in detail to appreciate its intrinsic merit.

¶And just consider for a moment the extraordinarily low price at which this 40-45 H. P. Cleveland is offered.

¶If you are not sure just what dealer is handling this car nearest to your home, just drop us a line and we will immediately advise you of his name and address, and enclose a request that he furnish you with a complete demonstration at your convenience.



¶If you are a dealer, and have not yet gotten into communication with us concerning this 1908 Cleveland—get busy! It is bound to be the selling sensation of 1908.

¶This car was conceded complete mechanical supremacy over all others by the critics at the Grand Central Palace Show.

Franklin

Type D—28 h. p. $2850

What do automobilists want?
The automobile that "does things."
What's that?
High power and light weight.
Why?

You'd better look into this question. French makers are already waking up to the public demand for light weight, which produces better results, with less cost, more safety, and more comfort. American makers will follow. Franklin has been high power and light weight since the start in 1902.

The best book on this subject is the Franklin 1908 catalogue. Send for it.

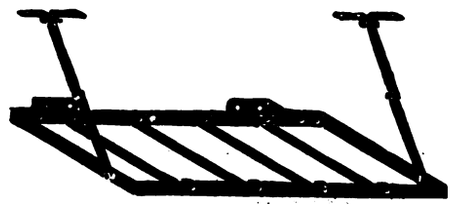
A Few of Our Domestic Auto Specialties



THE ROYAL TIRE HOLDER
Double

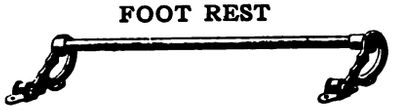
Will fit any car and any size tire. Will hold either one or two tires. Set consists of two long and one short piece. Made of extra heavy brass, highly polished and fitted with strong leather straps.

Per set $7.00

LUGGAGE CARRIERS

Made in stationary and folding styles. The braces on the folding carrier are provided with knuckle joints so that when the rack is not in use it can be folded.

Price, stationary $9.00
Price, folding 16.00

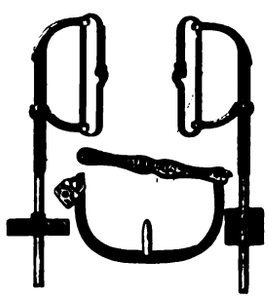


ROBE RAIL

Keeps your robes and wraps from being crushed or mussed in bottom of car. Rails are made of extra heavy brass tubing, highly polished. Made in stationary and adjustable styles.

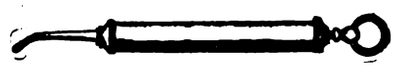
Price stationary 24 in..... $1.50
Price stationary 30 in..... 1.75
Price stationary 36 in..... 2.00
Price adjustable 30½ in..... 2.50
Price adjustable 30¾ in..... 4.00

FOOT REST



Foot rests enable the occupant of the Tonneau to brace themselves in a comfortable position and also prevent the accidental scratching and damaging of the body of the car. Constructed entirely of heavy brass highly polished and are adjustable.

Price, 32 in.....$5.00



THE IMPERIAL LOCK TIRE HOLDER

Prevent the theft of your Tires by the use of the Imperial Lock Tire Holder. Will accommodate one or two tires of any size and can easily be attached to any make of car. Set consists of two side and one lock bottom piece. Made of heavy bronze, highly polished and fitted with the finest leather straps.

Price, per set..$10.00

OIL GUNS

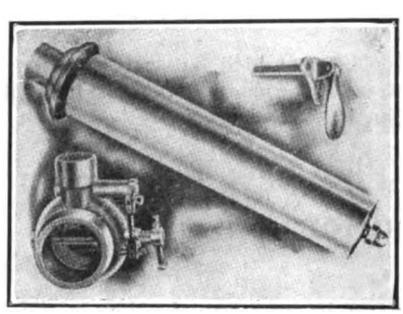
This is one of the many varieties of oil and grease guns of which we carry a large stock. The No. 125 Oil Gun is a good, substantial oiler. It is well made and is fitted with heavy grip handle.

No. 125, length 16 in., Price.....50 cents

ROYAL SCREW JACKS

Especially adapted for heavy cars. Its lifting capacity is 5,000 pounds. Jack can be raised or lowered by simply turning a lever. It is recommended for garage use.

Price $4.75



THE PHARE CONTINENTAL
Flare Front Search Light.

Made entirely of extra heavy brass. The Mirror Lens has great projecting power and a focusing attachment enables the adjustment of the range of light as desired. Continental Search Lights are well known for their superior qualities. These lamps are also made with swivel attachment.

Prices from .....$15.00 to $25.00

CONTINENTAL MOTOR CHIME
Four-Tone

This chime can produce a low musical note or a clarion blast, as the "occasion may require." Consists of a single 15-inch tube divided in four compartments, which produce four blended sounds in one.

Price complete, with 1½ or 2 in. Valve..... $15.00
Price complete, with 2½ or 3 in. Valve..... 17.50

The dealer who desires to handle the BEST line of Automobile Specialties would do well to investigate our line of splendid and profitable goods. Our 128 page catalog will be sent upon request.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, October 31, 1907. No. 5

SMITH SPEAKS OUT FOR ONE SHOW

Chairman of A. M. C. M. A. Committee Declares Himself at Annual Lunch—Other Subjects Discussed.

Unexpectedly the first gun fired at the almost intolerable two-show situation was publicly touched off at the annual luncheon of the American Motor Car Manufacturers Association in the Hotel Manhattan, New York, on Tuesday last, 29th inst.

The man who fired the gun was none other than H. O. Smith, chairman of that association's show committee, which fact gave added force to his remarks. Mr. Smith not only expressed the opinion that the time had arrived when there was room, or at any rate, there should be desire for but one truly national show representative of the whole industry, which should be held neither in October or January, but in July or August, and that it should be a show not for the public, but for manufacturers and dealers only. The shows for the public, he said, should be local shows, held in the spring, by the local trade organizations.

Mr. Smith led up to his address, which was brief and pointed, by firing a shot also at the practice of exploiting new models each year, which practice, he said, was surely passing, but while it prevailed, and coupled with the present system of shows and their dates, the best interests of the industry were not being served. He said the subject had been discussed by the A. M. C. M. A. show committee, but added that his remarks represented merely his personal views.

Gen. George Moore Smith, chairman of the Automobile Club of America's show committee, in what may be described as a real nice tone of voice, found fault with the big cars now in vogue. He does not consider seven passenger cars desirable and thinks that the lengthening of wheel bases has been carried too far and resulted in a type of vehicle suggestive of those designed for carrying theatrical scenery and telegraph poles. The result has been overloading and a general increase of tire expenses and other costs of upkeep. Lighter and shorter cars of moderate power are more desirable from every point of view. Having lodged his complaint, the General congratulated the A. M. C. M. A. on its growth and success and advised makers generally to turn more of their attention to commercial vehicles. In due course, Benjamin Briscoe, chairman of the A. M. C. M. A. management, returned the compliment by congratulating the A. C. A. and thanking it for its co-operation.

Of course, Winthrop E. Scaritt attended the luncheon, and, of course, he was called on to make a speech. He went soaring, as usual, without the aid of a balloon. He predicted that the motor fuel of the future would be radium. A speck on the point of a knife, he said, would furnish sufficient power to drive an automobile daily for twenty-five years. No one challenged the statement.

Diezeman in Receiver's Hands.

Following the filing of a petition in bankruptcy against the Diezeman Shock Absorber Co., New York, Judge Holt on Monday last, appointed W. H. Smith receiver for the concern. The petitioning creditors are Charles L. Kohler, $808; Theo. Cohn, $450; and W. A. Feuchs, $100, all on notes. It was alleged that the company is insolvent, had made preferential payments of $2,000, and transferred merchandise and accounts amounting to $2,000. The liabilities are over $32,000, and assets $7,500, principally in the factory at 1311-1313 Hudson street, Hoboken.

Badger Brass After Infringers.

Having acquired the American rights of the famous Besnard system, the Badger Brass Mfg. Co. means to protect them. Already legal warnings have been served on three lamp makers whom the Badger people consider are attempting to infringe their rights.

MAKING CONTINENTALS IN AMERICA

German Tire to be Reproduced Here—Tischbein Says Demountable Rim Tends to Solve Tire Problem.

On October 24th, the American Continental tire made its first formal appearance on the American market. It is in every detail a faithful reproduction of the tire made in the parent factory of the Continental Caoutchouc Co., at Hanover, Germany, which heretofore has been supplied by the American company. On the same date, there went into effect a new scale of American prices, in the making of which the fact that both freightage and import duties now are avoided met with full and proper consideration.

That the Continental people were preparing to market an American made tire has been a closely guarded secret for the better part of two years. The first ones were made in 1906 for use on certain of the American cars that participated in the Vanderbilt cup race, but they were not used for that purpose. Since that time, the arrangements for quantity production have been gradually developing but nothing concerning them was permitted to escape until every detail had been perfected and the American product had been so thoroughly "tried out" by actual usage as to receive the unqualified O. K. of the experts of the Hanover factory. All this has been effected and the American tire now is in being, and in no way can it be distinguished from the imported product.

The American Continentals are being made in the big plant of the Revere Rubber Co., at Chelsea, Mass., which company is one of repute and long establishment, and which employs about 1,000 operatives. The affiliation and working agreement between the Continental and the Revere companies is very intimate, E. S. Williams, general manager of the latter being also a director of the former, while the superintendents of

Digitized by Google

the Continental department in the Chelsea plant and of the Continental factory in Hanover have exchanged visits and spent several months at several different times in their respective plants in order that the reproduction of the processes and of the completed tire shall be exact. The German superintendent is none other than Dr. Albert Gerlach, who is of wide renown as a chemist and rubber expert in Europe. It was he who passed final approval on the American tire.

Willy Tischbein, who is the managing director of the Hanover plant and also president of the Continental Caoutchouc Co., of America, came over to attend the "launching" of the American product. He is now in New York and expressed himself as being thoroughly satisfied with the situation. In the course of a conversation, he departed from tires for a moment to give as his unqualified opinion that the demountable rim represents the final solution of the so-called tire problem. The Continental rim of this type, which now is being shown in America for the first time, and which also will be manufactured here, already is well known and is in gradually increasing use in Europe. Practically all tire troubles, Mr. Tischbein said, arise from the first hurried repair made on the road. The chauffeur is flurried or nervous and, as a result, sand or small stones get between the tube and the shoe; or the tire is insecurely fastened to the rim or insufficiently inflated and more trouble ensues. With a demountable rim all this is avoided. The spare tire is always inflated and ready for quick and instant application, and the punctured one may be repaired properly and at the leisure of the driver. These considerations are so great and so far reaching that while it may be slow of attainment, Mr. Tischbein believes that the final triumph of the demountable is beyond question.

So far as the marketing of the American Continental tire and rim is concerned, there will be no change. That work will be performed by the Continental Caoutchouc Co., with Joe M. Gilbert as its manager, and from his headquarters at 43 Warren street, New York. Gilbert, however, insists that the work is not work, but pleasure.

Firestone Opens Philadelphia Branch.

The Firestone Tire & Rubber Co. will this week open a branch in Philadelphia at 256 North Broad street, which is in the heart of the automobile district. It will be one of the largest establishments of the sort in the East, having a total floor space of 14,250 square feet. W. R. Walton will be its manager.

Detroit Auto Vehicle Assets for Sale.

The public sale of the assets of the bankrupt Detroit Auto Vehicle Co., Detroit, Mich., has been set for November 5th. The property will be sold either in bulk or in parcels.

The Week's Incorporations.

Bloomfield, N. J.—Torbenson Motor Car Co., under New Jersey laws, with $500,000 capital; to manufacture automobiles and motors. Corporators not named.

New York City, N. Y.—Pardee Motor Co., under New York laws, with $10,000 capital. Corporators—William J. Jackson, Leon B. Smith, and W. H. Webster, all of New York City.

Ithaca, N. Y.—Thomas & Grant, under New York laws, with $25,000 capital; to make automobile and marine engines. Corporators—C. C. Thomas, F. W. Grant and F. A. Cobb, all of Ithaca.

Jersey City, N. J.—Advance Engine & Mfg. Co., under New Jersey laws, with $25,000 capital; to manufacture automobiles, motors, etc. Corporators—H. O. Coughlin, A. C. Bear and John R. Turner.

Kittery, Me.—American Auto-Ad Co., Motors, under Maine laws, with $700,000 capital. Corporators—O. S. Paul, president, Kittery, Me.; H. P. Knowlton, secretary and treasurer, Malden, Mass.

South Orange, N. J.—Brick Church Automobile & Supply Co., under New Jersey laws, with $100,000 capital. Corporators—Amelia Hull, New York City; John B. Todd and Melvin O. C. Hull, South Orange.

Alexandria, Va.—Flynn Motor Car Co., under Virginia laws, with $15,000 capital; to do general automobile business. Corporators—J. J. Flynn, president, F. M. Scott, secretary-treasurer; H. I. Quinn, vice-president, all of Washington, D. C.

Gloversville, N. Y.—Gloversville Auto Glove Co., under New York laws, with $25,000 capital; to make automobile gloves. Corporators—F. S. Mills, E. J. Wilkins, S. B. Morrell, and E. W. Mills, all of Gloversville.

Rochester, N. Y.—F. A. Brownell Motor Co., under New York laws, with $400,000 capital; to manufacture automobiles, cars, boats, etc. Corporators—F. A. Brownell, W. A. Dunn and W. Deinberger, all of Rochester.

Omaha, Neb.—Bearing Company of America, The, under Nebraska laws, with $150,000 capital; to make bearings for automobiles. Corporators—Arnold C. Koenig, George J. S. Collins, Lysle I. Abbott and Will F. Seidentopl.

New York City, N. Y.—Standard Auto Rolling Chair Co., under New York laws, with $500,000 capital; to manufacture motor rolling chairs, automobiles, etc. Corporators—J. H. Kahrs, L. Albert, and L. J. Gregory, all of New York City.

In the Retail World.

The Wilson Trading Co., one of the old-line cycle jobbing houses of New York, will, on December 1st, open a retail store at 46 Cortlandt street. Automobile accessories also will be handled.

The Longacre Motor Co. will open its new garage at 48 West Forty-third street, New York City, this week. The company, of which J. Hovey Hill is president, will transact a general garage and renting business.

The Favorite Automobile Company, backed by W. C. Favorite, has been formed in Chicago and will open a garage at 1253 Michigan avenue. Charles W. Price, formerly with the Maxwell agency, has been secured as manager.

Fire in the Capen Motor Car Company's garage at 4739-43 McPherson avenue, St. Louis, Mo., October 17th, threatened for a time to destroy 45 cars. Prompt work by employes prevented a spread of the blaze. The damage was only $1,200.

A. E. Gilmore, one time manager of the Rambler branch in Boston, and latterly connected with the White Co.'s New York depot, has doubled up with Charles E. Whitten, also well known to the New England trade, and secured the Thomas agency for Boston and vicinity. They will operate as the Whitten & Gilmore Co.

Oscar A. Eskuche and Mitchell Mackay have formed the Commercial Automobile Co., which will look after Logan interests in Milwaukee. The firm has secured temporary quarters at Eleventh street and Grand avenue, pending the erection of a large garage to be located at Twelfth and State streets.

The Rees Co., which less than a year ago set out to engage in "advanced garaging" at 42 West Sixty-second street, New York, "went broke" on Tuesday last, when four creditors representing small amounts, filed a petition in bankruptcy on the concern. It was incorporated in January last with capital stock of $120,000, which amount was increased to $160,000 in August.

Charles E. Miller, the well known New York manufacturer, jobber and exporter, has added another link to his extensive chain. He has leased the large store at 1392 Bedford avenue, Brooklyn, and will be ready for business there in a couple of weeks. Hardly had this announcement been made when he closed contract with the Hartford Rubber Works Co. for the exclusive agency for Hartford and Dunlop tires in that Borough.

Judge Seabury, of the Supreme Court, has appointed Hugh F. Weston receiver for the Auto Operating Co,. 305 West Seventy-ninth street, New York City, under a bond of $20,000. The company is being sued for an accounting by its president, Charles F. Keuerleber, against David J. Curran, treasurer, and William J. Curran, secretary. The company was incorporated in December last year, with $10,000 capital, of which the president held one-half, and the Currans the remainder. An automobile livery was maintained at Lakewood and at Manhattan, Beach the gross receipts of which were $10,351.

SOME SHRINKAGE IN SEPTEMBER

Month's Export Losses Widely Spread, but Total Shows Impressive Increase—Where Ground was Lost.

While the grand total for the nine months shows an impressive increase, September proved an off month for the export of American automobiles and parts, as disclosed by the report of the Bureau of Statistics at Washington. The reason for the shrinkage that occurred is not apparent, but the fact remains, nevertheless. As compared with the corresponding month last year, losses are shown in seven of the geographical groups recognized, while the total exports during September of this year are $95,886 smaller than during September 1906, while there is a loss of nearly 50 per cent. over last month.

Were it not for the total, which shows a gain on the whole, it might be thought that America is losing its hold in British domains, to the degree that it is strengthening its position in France. The United Kingdom, British North America and British East Indies all show losses for the month, the first-named with a decrease of almost 50 per cent. as compared with the figures for September, 1906. Italy also jumped over to the debit side, in contradistinction to its position last month. France shows a gain of $3,997. Other Europe, West Indies and Bermuda, South America, British Australia and Africa have substantial gains.

Better results are shown, however, in the totals for the nine months ending September, substantial gains predominating. The table is apt to be confusing as the returns for 1907 are for nine months, while those of 1906 are quoted for six months. The totals show an apparent gain of $680,294 for the nine months, as compared with the six months of 1906, with an actual increase amounting to $2,738,252, as set against the corresponding period of 1905. The total number of cars exported during the month was 113, as against 177 during September, 1906. During the nine months 2421 cars have been shipped abroad, their total value being $4,442,478, exclusive of parts valued at $521,407.

Neighbors Object to Garage.

Eugene N. Foss, who is landlord of the garage on Newburg street, Boston, occupied under lease by the Locomobile Company of America, is somewhat victimized in having built a $67,000 structure for such use on land restricted against any buildings "offensive to the neighborhood for dwelling houses." Mr. Foss had begun the erection of the garage when Charles R. Evans, owning land near by, got an injunction against him. Purchase of the Evans property for $18,000 settled that matter. Later several other neighbors got busy and on October 22, Judge Loring, in the Supreme Court at Boston, issued an injunction on their application, restraining Foss and the Locomobile Company from using the building for automobiles. The matter is to be taken to the full bench of the court.

Marmon Will Study Methods Abroad.

Howard C. Marmon, of the Nordyke & Marmon Co., and designer of the Marmon car, will leave for Europe immediately after the shows. Although his own genius is of well proved fertility, he thinks it possible that the old country may offer some ideas which might still further add to the attractiveness of the car in which he is so wrapped and he goes abroad with that idea in mind.

Baltimore Show Dates Fixed.

Baltimore dealers will hold their annual show the week of November 16 to 23, in the same building in which it was held last year, namely the large garage at Maryland and Mount Royal avenues. B. R. Johnson, who managed the exhibit last year, will assume charge of the show this year.

Bates Will Make Spark Coils.

Charles Bates, with whom is associated Dr. J. H. Wellings, has leased the old Bijou theatre building in Lansing, Mich., and will convert it into a factory for the production of the Pearson spark coil. It is expected that the plant will be in operation before January 1st.

Robbins to Represent Rainier.

A. M. Robbins, formerly eastern manager for the Aerocar Co., now will go west. He has engaged as manager of the Rainier branch in Chicago.

FOREIGN MISSION FOR REEVES

A. M. C. M. A. to Send Its Manager Abroad to Investigate Export Opportunities—Plans are Comprehensive.

Believing that the foreign field, which has been overtilled by the makers of large, ponderous cars, offers opportunities for the American type of car, the committee of management of the American Motor Car Manufacturers' Association, at its meeting in New York on Monday last, delegated its general manager, Alfred Reeves, to visit the London and Paris automobile shows next month and generally to study foreign conditions, with a view of paving the way to a more aggressive campaign.

The best methods for selling cars whether through agents or branches; the plan of advertising campaign that should be followed, and other details are to be carefully investigated.

It is very well understood that marketing cars abroad cannot be done without a thorough understanding of the situation and the report of the investigations made by Mr. Reeves when placed before the big makers of this country, are expected to be of considerable interest. One of the large suggestions that has been broached revolves around an idea of a combined exhibit of American cars at the foreign shows of next year, to be participated in by all the members of the A. M. C. M. A., whose total output for 1907 is estimated at about 37,000 cars.

Reeves has been a prodigious worker in his capacity of manager of the association, and while he is quick to absorb ideas, if the snuff of salt water serves merely to refresh or add to his vitality, the organization will be well repaid.

At Monday's meeting it was decided to work further on the matter of admitting gasolene trucks to the docks and piers of New York, and to start a campaign in other seaboard cities. About half the docks in New York now permit their use.

There were interesting reports from the Committees on Good Roads, Legislation, Freight, and other departments that are in operation.

The idea of a stock chassis in the spring was strongly endorsed, with the explicit provision, however, that it be under proper management. It was recommended that it be held early in May.

B. F. Everitt, of the Wayne Automobile Company, was elected a member of the Committee of Management.

In attendance at the meeting were Benjamin Briscoe (Maxwell), chairman; R. E. Olds (Reo); W. H. Van Dervoort (Moline); Charles Lewis (Jackson); C. C. Hanch (Marmon); J. B. Bartholomew (Glide); A. C. Newby (National); and Charles E. Duryea.

On All the Best Cars You Will Find the Jones Speedometer

and here's a reason or two:

The Jones is the **pioneer** speed indicator.

The Jones is the accepted **standard** speed indicator.

The Jones is used in this country and abroad by Police Departments as a means for timing motor vehicles for reason of its **accuracy.**

The Jones won the Gold Medal **Reliability** Award in the Royal Automobile Club's Contest. All American and foreign manufactured speed indicators sufficiently practical to enter were in this contest.

S. F. Edge had the Jones on his Napier cars when he made the world's most remarkable record, traveling 1,588 miles 1,310 yards in 24 hours, averaging 66 miles per hour, on the Brooklands Track, London, Fngland.

The Speedometer cable revolutions per hour, at a 66 mile speed, total 168,300 or 4,039,200 in 24 hours, demonstrating the Jones **"staying"** qualities.

Do not buy a 1908 Speed Indicator without a Maximum Speed Hand and Instantaneous Resetting Trip Odometer. These features are POSITIVE NECESSITIES. They are exclusive with the Jones Speedometer and are included on all Jones standard instruments without extra charge.

JONES SPEEDOMETER
76th Street and Broadway
New York

We will send you upon request without charge a catalog and Speedometer Bulletin. Write Dept. No. 20.

For One Show Only.

It requires no very extended inquiry to discover that at least every other man identified with the industry is unfeignedly weary of the two-show situation.

The strain, physically, mentally and financially, that has endured during the last three years has been sufficient to cause many of them to openly and profoundly wish that a means were found to relieve a situation that has become almost intolerable and of the number so disposed it is quite natural that a majority should be men who have to do with the manufacture of parts and accessories.

With the chief point of difference that caused the automobile manufacturers to draw apart and travel two separate roads these accessory men had nothing to do and with it they are but indirectly concerned. But despite the fact, the burden, or at least the show burden, has fallen most heavily on them. They practically have been compelled to follow both armies. It is not strange, therefore, that some of them are wearied almost to the point of crying "Enough" and that they should crave the relief to which they are entitled, but which under present conditions is so difficult of attainment. There are some of the automobile manufacturers, who, while more cautious of expression, it is plain to see are similarly minded.

It is possible, of course, that given time enough the situation will solve itself. Carried to its logical conclusion, one or the other of the two nominally opposing factions must become exhausted. But of this end there is no pronounced evidence in sight, and whether it is wise to pursue a policy of exhaustion is a grave question.

Since two shows became the vogue, things have changed mightily and as one of the thinkers of the trade remarked but a few days since, it does seem, if they will not bury the bone of contention, that the two armies, both enlisted in a common cause, can well afford to no longer quarrel over it in public. So far as shows are concerned, he would have the Selden patent and all its issues forgotten. He would have but one show and that a truly national one. If the Automobile Club of America desires to interpose objections, or to assert "prior rights," he would bowl it out of the way, gracefully, if possible, but bowl it, anyway. It has secured its full pound of flesh and more from show promotion and can well afford to retire with good grace. If it appears that qualification is necessary to weed out the undesirables and those to whom the business is but a game, this thinking man would have an exhibitors' qualification established, either in respect to age or standing, or to price of show space. But above all arises the desire for one show and one show only.

That this man voiced more than his own opinion is certain. It probably is an opinion that will be discovered beneath the skin wherever it is scratched. The trade as a whole may be said to have wearied of the double show bill. Many of the accessory makers are undisguisedly so; so too, are, very many dealers, and indications are not wanting that press and public are about becoming tired of "too much of a good thing."

They are wise who are able to read handwriting on the wall and who are able also to profit by it. The obstacles are many, but where the cause of the whole industry and not of any part or parts of it are to be served, there should exist a disposition to bear and forbear, and to give and forgive, and there should arise men strong enough to turn the disposition into its natural channel. The proverb regarding the house divided against itself seems now to apply, and with the accessory men caught between the two walls of the house, it seems logical that from their ranks should come the men to meet the occasion and who will lead to the cementing of the breach and to one show.

The unexpected but timely public pronouncement of views in line with these opinions, as expressed by Mr. H. O. Smith, chairman of the American Motor Car Manufacturers Association show committee, at that organization luncheon in New York on Tuesday last, is evidence that the "getting together" necessary to effect the consummation so devoutly wished for should prove easier of accomplishment than seemed possible a week ago.

Friction in the Factories.

Preparations for the 1908 outputs being well under way, and the makers as a rule being about ready to go ahead with quantity production, it is borne in upon the factory man and the salesman alike, that the season is at hand when the commencement of deliveries will begin to make inroads upon stock in hand, and frequently on stock supposed to be on hand. The thought at once conjures up a vision of irate sales departments, urging the factory by all the known gifts of destiny to send cars at any cost; of dim lights burning all night in the shops where toiling hands are sweating out the work; and later by weeks or even months, of a second series of libelous attacks on the men in overalls, because the cars were

Digitized by Google

got out in too much of a hurry, and are not fit for their work.

Another phase of the vision presents these same production and selling departments in heated conflict over structural details which are held to be at fault, or satisfactory, according to the point of view. It shows bickerings and strife, and even where the question of rate of production and actual saleability of the product is not at all in doubt, more or less of "pull-hauling" between what are essentially two equally essential branches of the same undertaking. But why it should be that the salesman should feel imposed upon when the cars go wrong, and lay the blame upon the factory, or why the factory should blame the salesman when cars are thrown back for renewal of parts, is not distinctly apparent to the outsider. Only the factory man and the salesman know that it is so.

Evidently the question resolves itself into a consideration of system or lack of system to a great extent, tempered with the existence, or lack, of a proper spirit of co-operation between the departments, which enter into the business. The lack of proper sympathy between the heads and hands of the shops and agencies, and the ruffled tempers it often produces appears in a superficial way, to affect only the feelings of the men themselves, and to have small influence over the success or failure of the season's business. But in reality it acts directly on the profit balance of the maker and to a costly degree.

No one element in the business should be permitted to dominate another. All must come under one head and be governed by it. The dictatorial attitude of the sales department, frequently is bred of a broader understanding of market values and commercial merit than is the opposition arrayed against it. Similarly, production is governed by certain fixed laws of an economical and technical nature which not every salesman can understand. Only the administration is capable of overseeing completely the operation of all departments, and that fact should be understood throughout the organization. Manufacturing and selling departments perhaps to an almost universal extent, should be more in sympathy. More than that, the manufacturer himself, should always have his ear to the ground to detect any signs of aggression on either side, and suppress it, not alone as a policy of good government, but because the interests of the business demand it.

HEAVY FINES AGAIN IN PROSPECT

New York City's Failure to Erect Signs Nullifies Its $10 Tariff—Imprisonment for Third Offenses.

By a unanimous decision of the Appelate Division of the Supreme Court last week, the ordinance passed by the Board of Aldermen of New York City limiting the fine for overspeeding by automobilists to $10 for each offense, is declared illegal, as not conforming to the provisions of the State motor vehicle act of 1904. Ever since the much talked of decision of Justice Truax, early in August, when he held that the ordinance of the Board of Aldermen on the speed question superseded the State motor vehicle law, New York city magistrates have dealt with the alleged offenders, and instead of sending them to the Court of Special Sessions for trial, as had hitherto been the custom, have merely imposed nominal fines.

The decision of the Appelate Division was rendered in the case of William H. Hainer, who was held for Special Sessions, but who secured release from custody on a writ of habeas corpus. His arrest was used as a test case to determine the validity of the city ordinance, and to expedite a decision on appeal. Justice Truax, in the Supreme Court, upheld the writ and ordered Hainer's discharge. District Attorney Jerome at once took appeal, and his position was confirmed by the unanimous finding of the higher court, which means that the city ordinance is illegal. Hainer must therefore return to custody.

Hainer was arrested under the provisions of the State law of 1904 which makes overspeeding in the city limits punishable for the first offense by a fine not exceeding $100; for the second by a fine of not less than $50 nor more than $100, or imprisonment for thirty days, and for a third or any subsequent offenses by a fine of not less than $100 and imprisonment for thirty days. Offenders must be held for Special Sessions and tried there.

Under the provisions of the State vehicle act of 1904 municipalities were empowered to regulate the speed of such vehicles by special ordinances and under this provision the Board of Aldermen a year ago passed an ordinance superseding the motor vehicle law within the city limits and making the only punishment for overspeeding a summary fine in a magistrate's court, of not more than $10 for each offense, despite the fact that the State law specified that such cases be sent to Special Sessions, and also named the punishment for convictions.

The decision of the Appelate Division is of more than ordinary interest, both from the fact that it is of the utmost importance and that a fine point of law is involved in the finding. Justice Clarke, writing the court's opinion, says that the sole question at issue is whether the city ordinance complies with the requirements of the motor vehicle law under which it was authorized.

Justice Clarke holds that wherever a special ordinance is made by a city or village "such city or vilage must" erect signs on every street or roadway affected by the ordinance, warning vehicles to slow down on that street or roadway to the speed limit. As no attempt has been made by the city to erect such signs throughout the city streets, Justice Clarke says, it is plain that the legal requirements authorizing the city ordinance were not complied with. Hence the ordinance is void of all legal value and cannot be respected by the courts until the necessary signs, which must be conspicuously displayed, are erected on every city street and roadway.

Following this reasoning Justice Clarke and his colleagues find that Hainer's detention for Special Sessions was justified, and the order of Justice Truax upholding the writ is reversed and Hainer remanded to custody.

As a result of the decision the special sessions court now has disposal of nearly four hundred cases which had accumulated because of varying decisions as to the law, and especially because of the decision by Justice Truax. In disposing of these cases the special sessions court has decided that hereafter for a first offense the fine will not exceed $50, which sum will be the minimum fine for a second offense, the maximum being placed at $200. For a third offense it is agreed the defendant will be sent to prison for thirty days.

COMING EVENTS

October 24-31, New York City—Automobile Club of America's eighth annual show in Grand Central Palace.

November 2-9, New York City—Association Licensed Automobile Manufacturers' eighth annual show in Madison Square Garden.

November 9-16, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show at First Regiment Armory.

November 15-16, Newark, N. J.—New Jersey Automobile and Motor Club's 24-hour endurance contest.

November 26, 27, 28, Chicago, Ill.—Chicago Motor Club's three days' 600-mile reliability run.

November 30-December 7, Chicago—National Association Automobile Manufacturers' first annual exhibition of commercial motor vehicles in 7th Regiment Armory.

November 30-December 7, Chicago—National Association Automobile Manufacturers' Annual show in Coliseum and First Regiment Armory.

THE PALACE SHOW AND ITS DEVELOPMENTS

It is doubtful if, during late years, a public function opened under more unfavorable conditions than did the eighth annual show of the Automobile Club of America which was inaugurated in Grand Central Palace, New York, on Thursday evening last, 24th inst., and which ends this evening.

With Wall Street and other financial centers sorely distressed, with a dozen banking institutions closing their doors and practically every other bank being subjected to the drains of panicky depositors, and with the germ of public panic in the air—conditions such as these are not calculated to bring smiles to the face of the promoter of any enterprise, and least of all to the promoter of and the participants in an automobile show. A motor car represents more money than the average man is able to lay away in the course of a year or two. Popularly, at least, it is supposed to be the vehicle of the man of means and he was the man most vitally concerned with the financial stress which has just about been relieved.

But for all of that the Palace show opened with a rush and a crush. Opening night always is "paper night," and while the box office usually gives a good account of itself, it is the "complimentaries" that causes the crush. The Palace was jammed to suffocation Thursday evening, but it was plain to see that the bulk of the crowd was not of the sort that is interested in the transactions of stock exchanges or the reports of bank balances. It was largely made up of young people and some not so young, who would be motorists—or autoists, as some wise ones would say—if wishes were but motor cars. They were more intent on collecting souvenirs than in delving into the mysteries of polished chassis. Souvenirs, by the way, were more numerous than at the previous show or two, and while none were ornate or expensive, the women, as usual, scented them out and led the rush for them, and, also as usual, a few of the young men who ordinarily do not wear evening dress when making sales, and who do not often get so far from home, found the souvenir distribution an occasion for becoming what is too politely termed "fresh." The wonder is that some of them do not feel the sharp end of a hatpin or the knuckled side of a fist.

With the froth of the opening night blown away, Friday evening ushered in a crowd that, to tell the whole truth, was disappointing. There was no occasion for any one to elbow his neighbor. Officially it was denominated "Merchants Night" and possibly the average merchant was too much concerned about the safety of his bank account to think of automobile shows. The attendance on Saturday—"City Officials' Night"—was a distinct improvement and about the same attendance has since been the rule. How many of the city officials were present never will be known. It is certain, at any rate, that at least one of them was there, and he did not wait for nightfall to put in an appearance. He was the Fire Commissioner, and immediately following his visit things began to happen.

"No smoking" had been the cry that first met the visitors' ears when they set foot in the lobby of the Palace and in printed form it met their gaze at almost every twist and turn of the many twists and turns within the building. He who gave no heed to the warnings and in defiance of them carried a cigar between his lips or fingers was often tapped on the shoulder and reminded of his offense by the gray uniformed guards who policed the place. But despite these precautions smoking continued, exhibitors being the worst offenders. Within their own little enclosures some of them considered themselves immune, and persisted in puffing, that is, until the Fire Commissioner dropped in. He served notice that if the smoking was not stopped the show would be closed forthwith. The gray garbed guards "got busy" with redoubled energy and at least one of them received a black eye as a reward for his efforts. One of the exhibitors who refused to douse his glim or who objected to the manner in which he was requested to do so handed the darkened optic to the man in gray. For his generosity, he was hurried out of the building and "invited" to stay out. A flat tired newspaper man who "butted" into the proceedings, was likewise ordered out and instructed not to return. The latter, however, sneaked back through a side door and sought refuge in the press room, where later he was discovered by the guards who promptly sought to eject him a second time. He placed himself under the protecting wing of the manager of the press bureau, who played the part of protector so well that the guards retired across the threshold. They lay in wait for their prey, however, and he remained marooned in the room for a considerable length of time. How he finally made his escape is not made clear.

There were others whom the enforcement of the no smoking order seriously inconvenienced. Stories are told of more than one big man in the industry who closed themselves within stuffy coupes or town cars for a surreptitious puff, only to be detected and routed out by the vigilant watchmen.

The visit of the Fire Commissioner brought more than personal inconvenience to a few men, however. It caused the show itself to shed its dressing of autumnal foliage. The foliage had not been fireproofed and perforce, it had to be removed. And truth to tell, it was small loss. "Autumnal woodland setting" sounded good, and it looked well in imagination, but in reality it was painfully suggestive of nothing so much as a collection of common, ordinary, everyday dead leaves, devoid of contrasting colors, which some one had forgotten to remove from a previous exhibition of floriculture or forestry. When the dry leaves were removed the exposure of the gilded balustrades wrought a distinct im-

Digitized by Google

provement. Many persons then learned for the first time that the balconies are gilded.

With the foliage gone, there was left only the huge electric emblem of the Automobile Club of America, the red carpeting and the green bunting, which hid the nakedness of posts, pillars and walls. This green bunting was the despair of photographers and if there are few decent general views or pictures of exhibits of motor cars it is due to no fault of the camera operators. They tried hard but snapping dark objects against a dark background usually results in pictures of dark next-to-nothingness. The photographers thanked their lucky stars that there were exhibits of lamps and of other sundries that glistened. The stringent application of the fire regulations which greatly circumscribed the use of flash lights, added to the discomfiture of the picture takers and when on Sunday the doors of the Palace were locked against them, as they were locked against even the exhibitors, their cup of bitterness spilled over.

While the Fire Department may have appeared unnecessarily stern in its enforcement of the regulations, it is not to be railed at for refusing to "take chances." It requires no vivid imagination to picture the horrors of a panic of any sort in a building so full of halls and corners and passages, and steep, narrow stairways. No safeguards can be too great for such a place.

Of the exhibits there are none that "stand out" from their fellows. Uniformity of sign and decoration do not make for anything of the sort. Those cars which have pride of place on the main floor of course have a great advantage, but it is a pretty question if, though they lack the glare of light, the Rainier, Garford and Cleveland exhibits in the "annex" are not the most effective. And they are effective because they occupy generous space and the space is not crowded. Few cars and plenty of room constitute an open secret of impressive display that is too little appreciated. Some fine day some astute exhibitor will create at least a mild sensation and become the center of attraction by staging one car and one car only in the center of a generous space. There was one booth in the main hall that, while it held much of interest, disappointed many by what it failed to hold, i. e., the booth of the Ford Motor Co. The Motor World's exclusive story of the Ford four-cylinder landaulet, touring car and rumble runabout at prices approximating $1,000, $800 and $600, respectively, had caused many to "whet their appetites" for a view and inspection of such sensationally-priced cars, but alas! not one of them was in evidence. The now well known Ford runabout and six-cylinder touring car, which were the startlers of the previous year, were there, but the new comers—well, according to apparently well founded report, they were on very private view at the Ford store further up town. The Ford Motor Co. will not begin making deliveries of the new models until February and they were not anxious to create a premature demand by disclosing them to the general public.

The show was absolutely devoid of sensations, so-called and otherwise. There was not one car that was more talked about than any of the others; not one exhibit that attracted a larger crowd than was attracted to any of the others, souvenir distributing stands excepted. Possibly the crowd might linger longer in front of, say the Colt runabout, but if so, it was because that creation crudely suggested a Vanderbilt cup racer or because some of those who stopped and gazed were curious to discover whether with its massive front and "dinky" seats placed on what may pass as the flooring of the car, it really was designed as a vehicle for pleasure. Of vehicles that excited interest and caused at least passing comment, it is safe to say that none caused more than the big green wire-screened vehicle in the exhibit of Rapid commercial cars. It was lettered "City of New York. Police Department," and despite its boasted cosmopolitanism, New York, in which horse cars still are to be seen, found in a motor propelled police wagon cause for curiosity and chatter of the light and bantering order. The idea or practice of driving prisoners to jail in an automobile still is new—to the average New Yorker.

In the accessory departments, there was room for variety and for some action at least. At the exhibits of ignition appliances, sparks snapped or crackled, and wherever there was a speed indicator, an electric motor served to show it in the act of indicating. But for human action it was necessary to view the several displays of shock absorbing devices. The men who demonstrated them earned their pay and their chief reward was that as they alternately compressed and released a set of springs, the sight or the noise never failed to attract a crowd. The men whose business it was to demonstrate demountable rims also "earned their passage." Of all the accessory exhibitors, the tire people, as usual, made the most of their spaces. Whether from intuition or extensive experience, they long since ceased to make their show exhibits resemble a retail store or a wareroom, and of late years their booths have been more like well appointed private offices or high-grade sample rooms, which is to say that they have become refined, restful and inviting, and, generally speaking, this was true of their displays at the Palace Show.

Motor cars and accessories were not the only things for sale at the show, as was discovered when, with no intent to deceive and in all innocence, a Motor World man wandered into the Carter reservation. He was not neglected. In fact, he did not have time to introduce himself before he was asked to buy a two-motor car without any tiresome preliminaries about the virtues of the vehicle. But this seeming directness and getting to the point soon took on the light of itself being a mere hasty preliminary to a more vital matter, as apparently no importance was attached to the answer. In fact had the visitor been ripe for so sudden a proposal of purchase he would for the moment have lacked opportunity to indicate it, as the salesman hurried to call attention to the fact that it was still possible to buy stock in the company.

"Yes, indeed," said the salesman, more in emphasis of his own declarations than

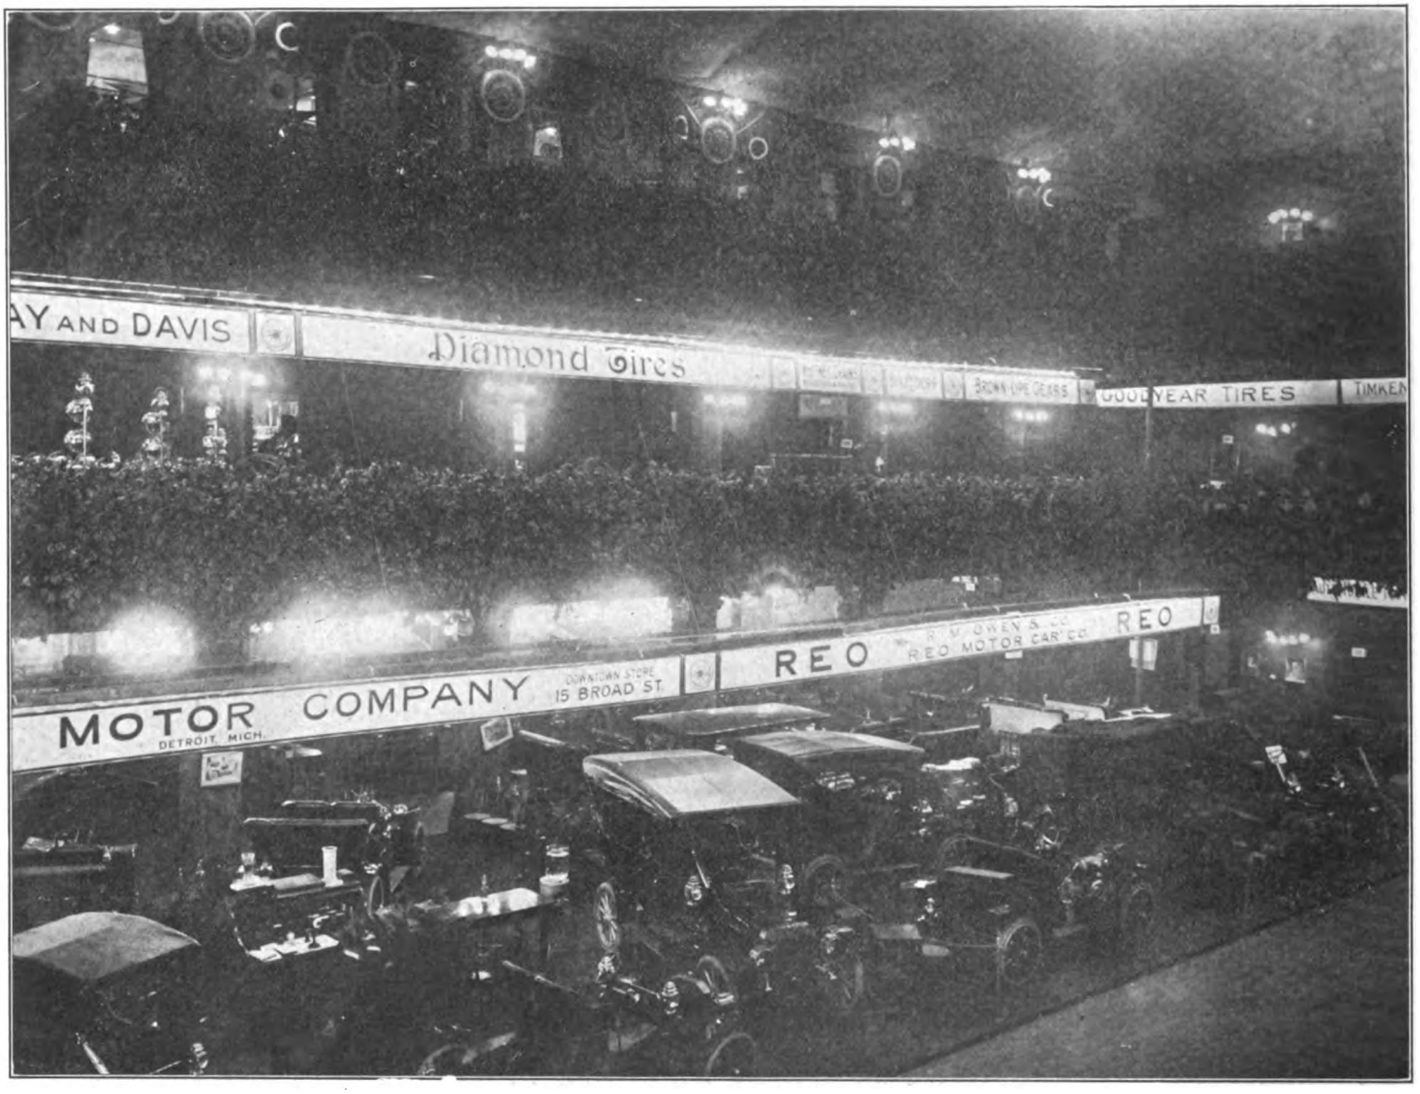
NIGHT VIEW FROM ONE OF THE BALCONIES

in confirmation of any expression by the visitor, "you can get stock now for $3 a share that will go up to $5 in a very short time now. After that you can't get a share of it under $5. Not only that, but if you are a stockholder and want to buy a car you can get it at 10 per cent. off the regular price, so you see for even just a small investment you get a chance to save $400 on a $4,000 car, which is pretty good. Then too, there is a mighty good chance of a young man like you being appointed a sales manager if he is one of the early stockholders. Possibly not in New York City, but in one of the big cities of the country, which would be a grand thing with lots of money in it.

"But you wouldn't even have to wait for the factory to be completed," he continued, "because you could start right in selling stock as I'm doing and make a mighty good thing of it. We've just come up from the Jamestown exposition, and the people that saw our proposition there are mighty enthusiastic about it. This will tell you all about how the stock is allotted, and when you've read it over you come back and subscribe."

This last was as the visitor edged away from the stand. He stood outside a moment, surprised to find himself loaded down with booklets and leaflets enough for a winter's reading course. As he was about to go the salesman followed him up, with a pencil and tablet in hand.



"Give me your name, please," he requested. "You understand, of course," he continued deprecatingly, "that when you come in as a stockholder in our corporation there is a little bit in it for me, and if I have the record of your name why then I'm sure of getting it. You see I want to be sure of my commission just as you would be if you were selling the stock, as I hope you will be before very long, because its a right good thing."

If the salesman's talk was persuasive and convincing, the printed matter that was supplied was not less so. The salesman had said that the price of the stock was $3 a share, and the first of the booklets said the price was $2. The subscription blank gave the price at $2.10 per share, all of which was somewhat confusing, particularly as in later conversation on the subject some one seemed to recall that the price to government clerks in Washington, when the "golden opportunity" was offered to them, was something like $7 a share with a possible advance to $10. So the Motor World man went back again a little later to have it explained. He was also curious to know about the factory in Hyattsville, Md., that the circular told about. Inquiry concerning the latter was put first, another salesman being approached.

"Our factory will consist of nineteen big buildings right near Washington," the second salesman explained with enthusiasm. "It is'nt built yet, but we have a site near Washington and close to Hyattsville, too, and expect to have at least one of the smaller buildings finished before the end of this month. We already have a small assembling plant in Detroit and are very busy building a machine for the Vanderbilt cup race."

When it came to explaining about the various stock quotations, he suggested that the inquirer see the salesman with whom he had originally talked, and turned to convert others of the show crowd who stood

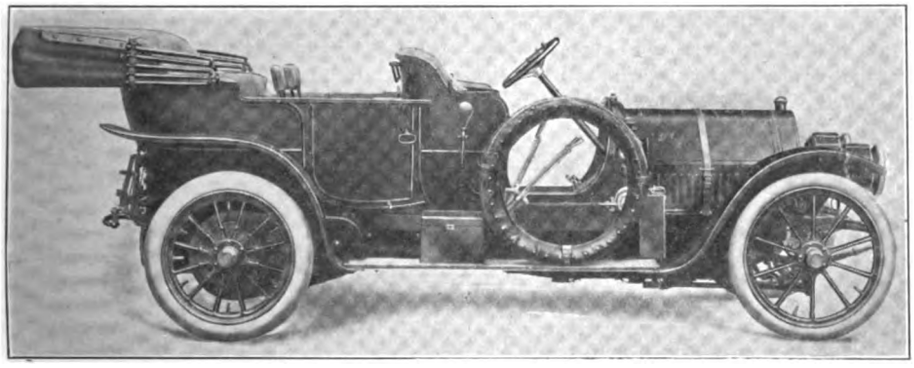
Digitized by Google

ANOTHER NIGHT VIEW FROM THE BALCONY

gaping at the curious double motored display. The original salesman could not be found for the moment, so the question of the price of getting a car at a discount and a good job selling stock remained unanswered.

About the Cars Generally.

One thing should be a source of devout and profound gratitude to the motorist, namely that American automobile manufacturers and all who pose in that category have come into a realization of the true worth of well finished bodies, irrespective of type, class or size. In the matter of body work the hand of the carriage maker grows stronger and stronger, and his influence is more readily apparent as time goes on. The result is a grateful relief from some of the productions which have been thrust before the show goer in days gone by. The cunning hand of the carriage maker has molded panels into graceful curves and given them that subtle strength which counts for so much. The same hand has put some of its best work not simply into the dressing of the cars,. but also into the choice of colors and dainty blending of trimmings and lines that until within a year or two were unseen and undreamed of.



True, on several of the cars exhibited were to be seen varnish runs. Traces of wet paint—the trail of the scramble for the early show—came off on inquisitive fingers applied to the under sides of frame sills and the edges of doors, and occasionally a body would be seen which, because of its roughness, proved a painful eyesore to mar the harmony of the show as a whole. Such instances might almost be counted off on the fingers, however. Most of the cars were well and carefully "done up," and gleamed the fact both far and near. As to the color schemes, they were mostly of the gentle and harmonious sort which pleases without being intrusive. Yet here and there a flaming hue would jar the visitor's system, and one or two combinations were so vibratory as to excite comment. A strong claimant for distinction in this respect was the National runabout, which was gay with red bonnet and seats and green running gear set off with suitable striping, the colorative climax being secured in the painting of the cylindrical fuel tank and its cradle in the rear which wore a clamorous direct-drive plaid of the same decorative elements, set off in gold. The effect was exclamatory —to put it mildly, but as a wilful and intentional violation of all precedent in automobile decoration, it was pardonable, and even laudable as an attempt at improving the scenic effect of the Palace.

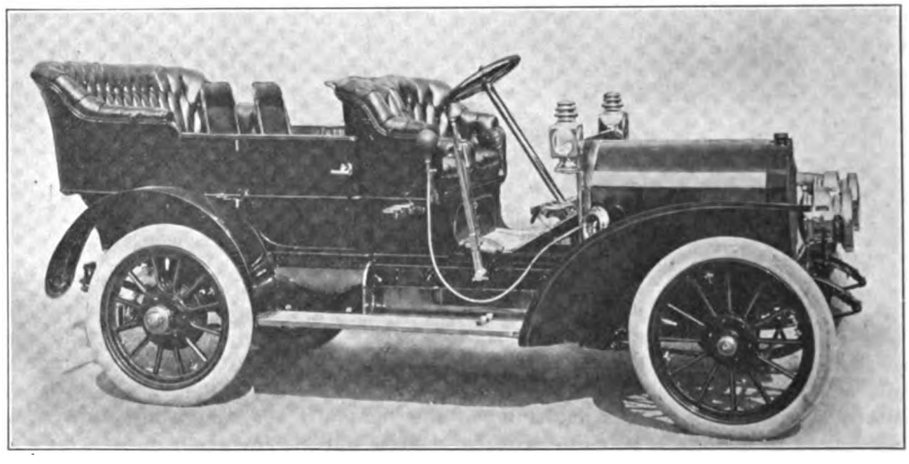
Interior trimming and upholstering, like the gloss upon the outside of the cars, appears to improve from show to show. If one or another point of criticism were permissible, they might be based on the grounds that the all-prevalent folding or "jump" seats are almost universally crowded too close to the rear seat, whereby the occupants of the latter cradle have little or no knee room when the tonneau is loaded to its full capacity. Or that these same seats fail to disappear when bid to do so, but obtrude themselves in ugly mechanical bundles at the side or on the floor of the car. Or that in many cases the drivers' seats are even yet practically inaccessible to any but an acrobat or a very thin person of india rubber texture. But these things

Digitized by Google

are trivial in the light of what might have been said righteously one time, and had better be let pass.

Styles in body construction appear to be quiescent. Types are converging more and more, and a touring car is a touring car, a runabout not an aspirant for honors in another class, while the closed vehicle has settled down to a condition of apparent usefulness suggestive of theatre parties and shopping junkets rather more than of miniature dwelling places built for the accom

THE NEW PREMIER



modation of the motorist en panne. The census shows that some 17 per cent, of all cars shown were of the closed type, and a goodly proportion of those answered to the description of the landaulet or cab. This is a new departure and in some respects a welcome one, since the heavy limousine, while useful in many ways, is hardly suited to any but the high-powered car, while its smaller classmate is apt to have either an over or underdone appearance. The advantage of the landaulet, above all other advantages is its convertibility. This element appears in the limousine occasionally as well, however, as in the case of the body shown on the large American Mors car, the sides of which were removable and might be folded up and tucked away in compartments under the roof when the owner wished a semi-open vehicle. The Garford and Stoddard-Dayton landaulets as well as the neat little inside driven coupe of the latter type, were seemingly better suited to the work of the moderate weight and mobile vehicle most in requisition for average use. The daily change of exhibits at the Garford stand, also brought out on Monday an extremely neat and pleasing Victoria with a sort of Central Park air, its body as yet in the wood.

The strong feature of the show, however, counting both numerically and from the standpoint of average interest, was the runabout feature. A full quarter of all vehicles shown were of the roadster runabout pattern. This to say, they were of the full-grown chassis type, fitted with young bodies. Further groups of 8 and 5 per cent., respectively, made up of smaller runabouts and runabouts of the buggy type, added to a total of 40 per cent. of all vehicles, answering to the description of runabout, or handy machine, of one type or another. Formerly, the runabout was a diminutive vehicle capable of seating two passengers and possibly two more—except on hills. The term at present applies merely to type of body and at the show, was found to apply to some rather husky vehicles in which passenger accommodation appeared to be something of an afterthought, and a hasty one at that. The type is a taking one in many respects; it is inclusive; it is American; and furthermore, it lays no stress of tradition upon the designer. Hence, in part, its popularity.

Second only to the general appearance of the machines, perhaps the point which most forcibly struck the visitor at the Palace was the general movement toward the simplification—or apparent simplification—of the control mechanism. Once, designers strove to elaborate the fittings and equipment visible on the dashboard to the highest possible degree. It was bewildering to the novice, and thereby impressed him; it was mechanical-looking, and therefore recommended itself to those who love harmless and amusing complication, or who enjoyed having something to watch; and it glittered, and hence recommended itself to the purposes of the exhibition. The tide has ebbed now, and the race is to see how much can be eliminated or hidden from view.

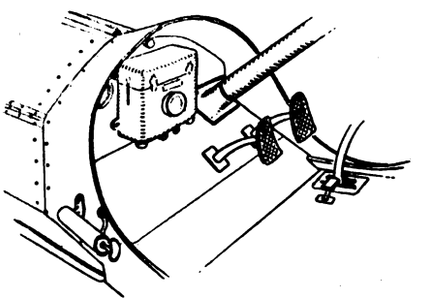
In many instances there was apparent on investigation, a real simplifying of the controlling devices required for the operation of the vehicle. Thus in the Garford machines, and especially in the case of the little Victoria already mentioned, the long, sloping footboard, rose to about half the height of the dash, which was adorned with nothing more than a single push-button for short-circuiting the magneto. Two pedal plates of the popular broad, push pattern the steering column surmounted with two levers for controlling the motor, and the two usual side levers, completed the visible equipment. Nor was the space under the angle of the footboard and behind the dash a place of concealment. Only the pressure-feed oiler was mounted there, and a small trap in the flooring gave ready access to it. The Model B, chassis, of the same make, had, in addition to the equipment already named, a foot accelerator of the piano pedal type, located between the clutch and brake controllers.

A distinct and remarkable opposite extreme was observable in the case of the new Ellsworth car, which mounted a hollow dash answering to all the requirements of the Pandora's box of narative fiction. It contained in addition to the actuating devices brought down from the steering column, the high tension magneto, coil, timer, and carburetter, all neatly and compactly arranged, and destined to be covered in by a perfectly plain panel board. The effect of simplicity was thus triumphantly consummated without removing the important auxiliaries from the driver's reach. The steering column of this machine also was noteworthy in several ways. The pillar, instead of being tubular and of light or even flimsy construction, such as many of the cheaper machines mounted, was massive, made of steel, and roughly triangular in section. Just below the wheel, and protruding from either side of a rectangular box were a set of four push rods extend-

THE NEW GARFORD

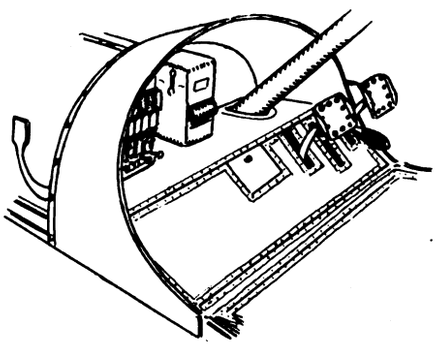
Digitized by Google

ing transversely of the machine and ending with finger-pieces placed within easy reaching distance from the rim. In driving, the fingers of one hand might easily reach either of the button tips, to push it toward the column, while those of the other would naturally force it in the opposite direction, if required. In this way the magneto timer, coil timer, throttle, and magneto-coil switch, could be actuated at will, and without the necessity of releasing the grip of the wheel, each bar moving through a detent mechanism which gripped it in successive notches and prevented jarring out of adjustment.



Between these two types, the whole gamut was run from actual to merely apparent simplicity, the result in every case being a uniform simplification of the actual motions required to operate the vehicle, and a very profitable doing away with needless visible mechanism. Pedals, were almost without exception of the push plate type, with large pads, often protected at the sides with flanges to prevent the sole from slipping to one side. This device was found on the Stoddard-Dayton cars and others. The large plates on the Acme pedals were hinged and held in normal position by springs, the intention being to allow them to conform to the natural angle of the foot. Like the Garford chassis, the Rainier and Cleveland accelerators were mounted between the clutch and brake pedals, and were of the piano lever type. A couple of exceptions to the push-pedal rule, were found in the Maxwell and Gaeth machines. The former, as applied to the accelerator of the 26 horsepower car, had both heel and toe plates, arranged to interlock, the pedal being set by direct push, and released by depressing the heel catch. The Gaeth pedal was of the same sort, the clutch being applied and locked in engagement by direct thrust, and contrary to general practice, while its release was accomplished by rocking the foot back upon the heel plate.

An unusually simple system proved to be that of the little Overland runabout, which was controlled by three pedals, two for the change gearing and one for the brakes, while no levers were used except those on the steering wheel, required to handle the motor. The brake and high speed levers were of the push pattern, while the low and reverse controller had a rounded top suitable for engagement by the ball of the foot, and capable of being rocked forward or backward as occasion demanded. The interconnection was such that throwing in one pedal released the others.



Seemingly there could be little variation in the use and structure of the side levers. Yet a number of interesting variations to common practice were observable, as in the case of the De Luxe gear shifting member, which had a latch for guarding the inadvertent use of the fourth speed as well as the reverse, which commonly is the only one so protected. The Stoddard-Dayton gear levers are mounted inside the chassis frame and well within the confines of the footboard. In the cases of the National, Crawford Model E and Pennsylvania machines, the usual practice of placing the emergency brake lever outside the gear lever was reversed, the emergency being located nearest the steering column and the driver's hand. The selective lever system employed on the little Brush cars was remarkable in so small a car, and also from the fact that the emergency brake was applied by one of the four possible selections. The Atlas runabout was distinguished by a change gear lever which in addition to its regular motion might be swung outwardly to permit of ready access to the seat from the right hand side of the vehicle—a simple device, in principle and effect, which well might be imitated.

Among unusual features in the same connection may be instanced the placing of the coil under the front seat of the new Imperial roadster, to clear the dash of litter; the mounting of the timer in front of the dash of the Moon car, behind glass, set flush; the use of low side doors on the Dragon touring car; the Frontenac dash with its large storage space; and the dash of the Wayne roadster which also afforded some little storage room. Aluminum footboards were observable on the Premier, where only the inclined riser was of this metal, and the American Napier six-cylinder limousine, which had also a thoughtful provision in the shape of plates covering the sills at the ends of the footboard, which were of sheet iron roughed up with rasp teeth, to form a safety tread. One or two other cars also had aluminum floors. Among them was the De Luxe, which was unique,

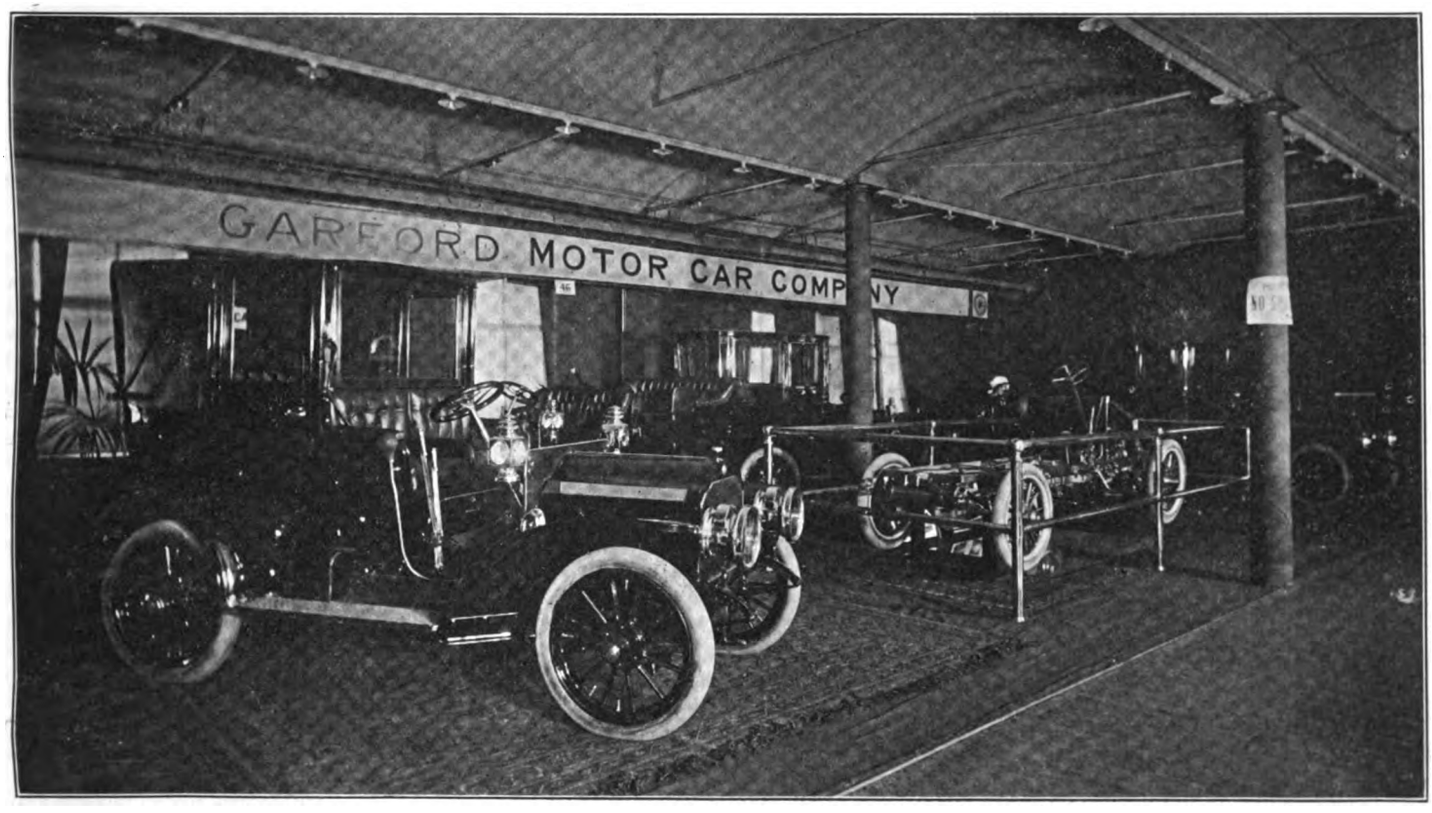
in that the incline mounted a rectangular bronze plate in which were arranged the auxiliary air and oil pumps, with their stop cocks, all nicely labelled and set flush or nearly so, with the board. Brass or bronze trimmings to the foot board appeared in various instances, the Great Smith car having a somewhat unusual provision in the shape of a bronze casting carrying the slots through which the pedals worked, thus protecting them and strengthening the flooring.

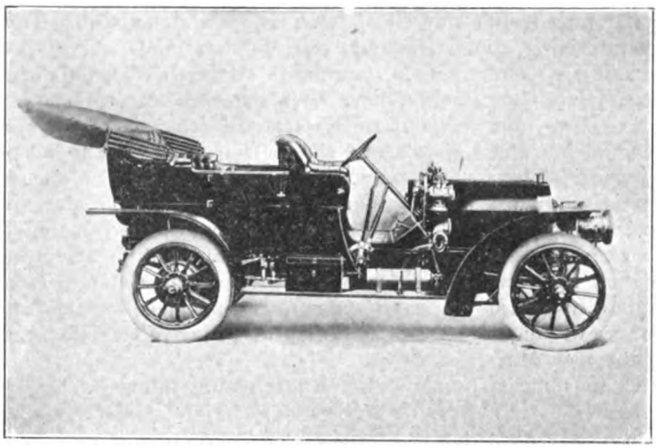


It is several years since the makers, as a rule, gave over the practice of adding the wings and splashboards, or mud guards and fenders, as a sort of final and reluctant finishing touch to automobile beauty, as it was then rated. Almost universally the delineator of the body now has influenced the shaping of the elements to harmonize with the characteristics of the vehicle as a whole. Those inconsequential-looking little flanges turned down around the outer edges of the guards, which began to appear last year for the first time, have proved their worth in checking the out-thrown dust. They are somewhat more in evidence than formerly in consequence—if a general impression may be relied upon—and are variously constructed with either brazed or riveted flanges. The latter method of construction gives a rather novel appearance to the guard because of the rows of rivet heads around its periphery. The National and A-K cars mount this type, among others.

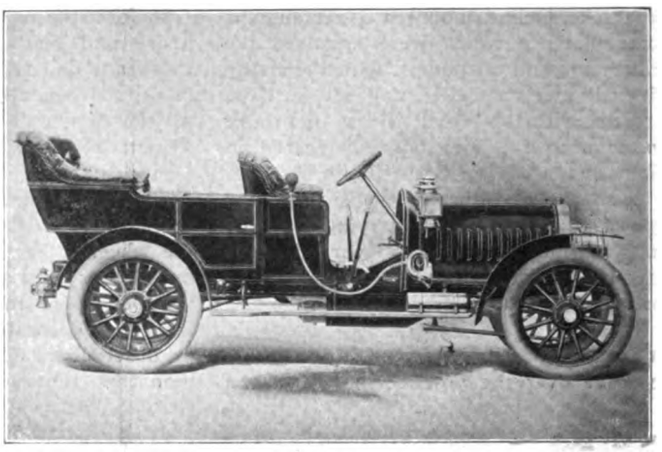
In form the use of the long sloping front guard and rear close one conforming to the shape and size of the wheel, is a combination frequently to be seen. Such cars as the Rainier, Garford, Premier, and Wayne roadster, are so equipped. The Continental, Glide, Pennsylvania, York-Pullman and Cleveland, mount rear guards carried directly backward from the top of the wheel, either ending in a plain tangent or bending up slightly at the very end. The full benefit of the straight tangent guard from the decorative point of view, might be observed to advantage in the new Marmon cars, the guards of which in addition to this point were convexed slightly on the upper side, softening the effect, as well as improving the action of the system on the road. With the big runabout roadsters, naturally the front guards are carried to a lengthy extreme, as instance the conspicuous cases of the Gearless Greyhound, Great Chadwick Six, Frontenac, and other monstrous creations.

A considerable number of the makers use protecting wings between the running boards and the sides of the chassis, thus doing away with all cross draughts when the car is in motion, and very materially increasing its cleanliness. This is true of the Lambert, Marmon, De Luxe, Garford, Maxwell and Austin, among others, while in the Premier, the rear guards only are brought over to the body, and in numerous other instances, only the front guards are brought over. The Reo guards are made full and complete this year. Many other cars, great and small, however, have no such provision.

Running boards, here and there, presented points of "difference" from what might have been expected, as instance the American Napier and De Luxe aluminum plates, and the built-up steel type found on the Dragon touring car and the Moon, in which thin strips of metal, set on edge and riveted together, gave much the same effect as the expanded metal used in structural work, and which must invariably present an even and safe resting place for the foot, as well as having no power of retaining mud or water.



Among the interesting things to be dis-



covered in axle construction may be mentioned the equipment of the Brush runabout, both in the single and twin cylinder types, which is of wood, oil-soaked, trussed and braced with metal, and fitted with metal end pieces carrying the wheel journals. Another departure from the ordinary developed in the case of the latest model Crawford car, which has a tubular front axle, reinforced by a solid bar inserted in it. As for metals of construction, the use of steel is, of course, practically exclusive, yet, one or two exceptions are employed, as instance, the Cameron and Acme bronze front axles, representing two widely divergent classes of service. In one case, that of the Great Smith car, the former use of a bronze front axle has been discontinued in favor of steel of similar section.

Little in the way of novelty was to be expected in axle sections, and little was found. The Ellsworth axles appeared ex-

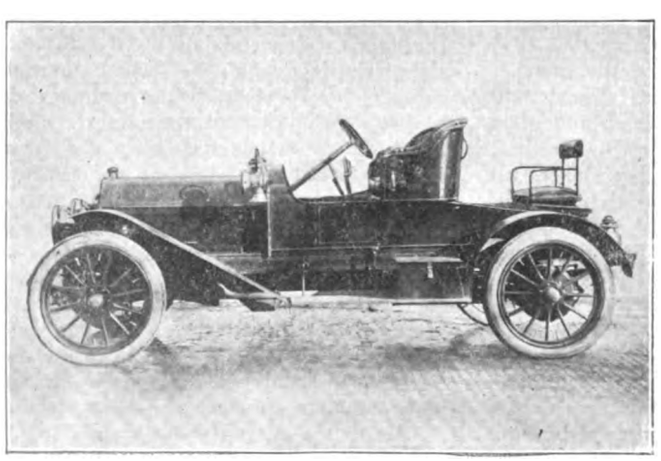
Digitized by Google

Pennsylvania.

Rainier.

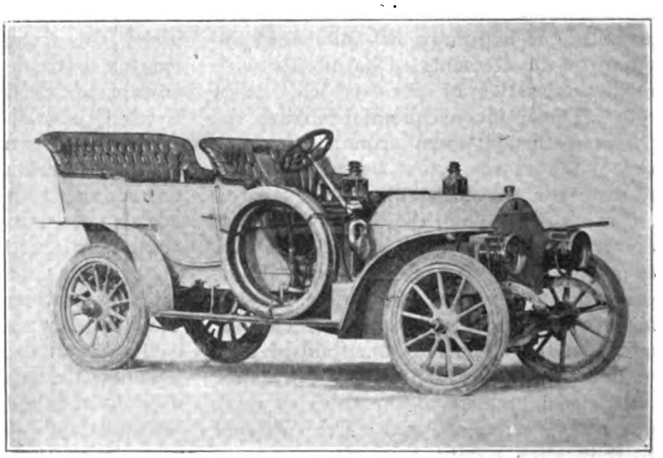
tremely light, probably owing to the use of the precious automobile metals of which the machine is reputed to be constructed throughout. The Mitchell front axle has a much wider flange at the top than at the bottom, thus giving the effect of a T-section in some degree. The American Mors front axle is of square section at the ends and rounded in the centre. Otherwise, the types used were either of tubular or I-beam section—and in the ratio of about one to three, so far as could be judged.

Rear axles were for the most part of tubular section, owing to the preponderating use of shaft drive. In fact, this pattern of axle was exhibited on about 90 per cent. of all the cars staged. Exceptions to the rule were found in the case of the chain driven cars, such as the Chadwick, Ellsworth, Acme and the ever exceptional Brush. The DeLuxe I-beam, live axle, a well-known feature of the machine, is continued in unaltered form.



Car weight is a matter of comparatively small importance in itself, so long as every vehicle has sufficient power to propel itself under the average conditions of the country where it is used. More than that, less and less interest appears to be manifested in it by the show goer, from year to year Yet between weights and tire sizes, there is a direct relation which, considering all that is involved, would appear to be of sufficient exactitude and importance to breed some little agreement between cars of corresponding types. That such is not absolutely the case, however, but that instead, considerable variety exists, is a somewhat surprising conclusion. For another thing, the nominal growth of the use of large tires, is not so apparent at this time as might have been expected.

Thus, taking a representative group of the show cars, including the best and most consistently designed machines as well as several of the most successful, 17 were found to be equipped with 34 by 4-inch tires, front and rear, and their weights ranged from 2,100 to 3,000 pounds, in jumps of approximately 100 pounds, nominal rating. Three of them weighed 2,400 pounds, and three groups of two each developed 2,500, 2,800 and 3,000 pounds. The remainder were of increasing powers between these limits, and neither in design, purpose, nor geographical location was discoverable any explanation of the popularity of this one size.



Five others, taken at random from specifications of all cars exhibited, and weighing between 2,000 and 3,000 pounds, were shown with 32 by 3½-inch tires. The fact that they were roadster models, would seem to explain the agreement, were it not for the fact that their weights differed by several hundred pounds in the extreme, and that others of the same class, and weighing no more, were shod with 36-inch tires, either 4 or 4½ inches in diameter.

As a matter of fact it was difficult to find makers who had increased tire size since last year on models still carried without material change. The Reo cars run on 1-inch larger tires than last year, to be sure, but are little different in other respects, which might be supposed to affect the matter. The Jackson touring cars, by way of contrast, were said to have ½-inch smaller tires than last year, and to have their wheel base reduced by 1 inch. Nothing like the almost unanimous acclamation of increased tire sizes such as that of the last Palace show, was heard.

The use of unequal sized tires on front and rear wheels, also showed small development one way or the other. Several rather startling combinations were to be found, however, as on the Chadwick touring car, which was listed with 34 by 4-inch tires in front, and 36 by 5 in the rear, or the American roadster with a 36 by 3½ and 36 by 4 equipment. All told, perhaps a round dozen of the makers of standard cars of the medium type and included within the above weight range, regularly stock different sizes on front and back of car.

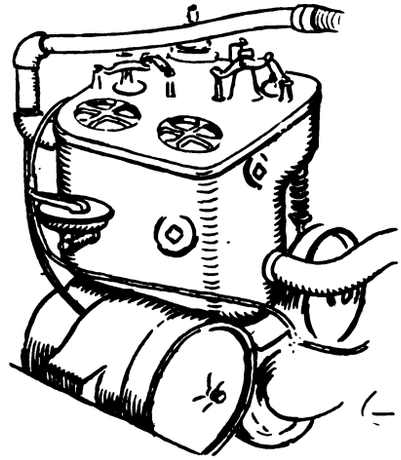
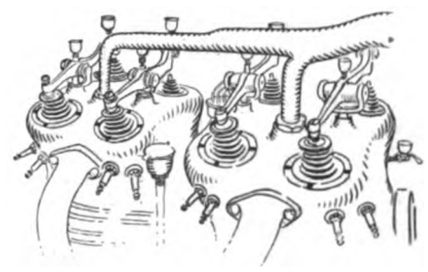
Water Cooled Marmon.



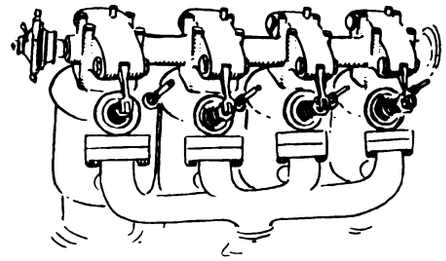
Similarly an attempt to discover any growing fixture of relation between wheel bases and weights, or wheel bases and duty classification proved disappointing. Out of some 40 cars, weighing, as before, 2,000 to 3,000 pounds, a range of 3 feet was found to exist in the wheel bases. Two of these machines with 103 and 136 inch bases, weighed, according to listing, 3,100, and 3,000 pounds, respectively, and other equally eccentric variations were found.

A general increase of wheel and wheel base sizes followed the increasing weight of the car, as a matter of course, yet the relation did not appear to be in either case, the fixed one that might have been expected. Generally speaking, runabout and touring car lines were shown on chassis closely related, if not exactly alike except for alterations in the positions of the radiator and steering gear. Yet the credited weights failed to reveal as much difference as might have been expected, and no general similarity of practice in altering tire sizes or leaving them the same in both types, was noticeable.



MOTORS.

With a total horse power reaching well into the hundred thousands, ranging from 4 horsepower units in runabouts to 90 in touring cars, the endeavors of manufacturers to increase the reliability of the motor proved an interesting feature to visitors at the Palace.



Strict attention appears to have been given to each motor that the best equipment might be procured for ignition, lubrication and carburation, and in no case have these three important features been neglected. While these are the vital auxiliaries of the hydro-carbon motor, in relation to the reliability, other details to accomplish economy and durability also appear to have been given due consideration to a marked degree. The four cylinder vertical motor predominated, of course, but, also, of course, the six cylinder engine shows an increase, there being twenty-three of the latter in evidence exhibited by eighteen manufacturers. Of striking interest among these may be mentioned the new

National "Little Six," a particularly compact machine considering its power; the Stoddard-Dayton and American Mors. Among those which have been seen before, the Ford "6-40" still holds its own as a model of lightness and simplicity. The chief aim in most cases has been simplicity, which, of course leads to less mechanical intricacies, giving an opportunity for the novice to derive the best of satisfaction from his power equipment. In general, no noticeable effort has been made to reduce the weight of the motors, the aim of the designers having been simplicity, accessibility and durability, without sacrifice to cost.

No noticeable radical features were to be found in the array of motors, notwithstanding the fact that quite a number were exhibited for the first time. The number of motors with overhead valve gears, however, such as the new Stoddard-Dayton four, the Pennsylvania, and the Model E Jackson, was sufficiently great to attract attention.

The Marmon air-cooled 90 degree motor, with its new detachable cylinder heads, easily removable without disturbing any of the valve adjustments, was a prominent and characteristic feature. The valves are situated in the heads, the latter being attached to the cylinder by four long stud bolts passing through the cooling flanges to the crank case. The new water-cooled Marmon also proved something of a revelation, the arrangement of its intake piping being absolutely unique. Siamesed intake ports are employed in its twin cylinder units, the gas entering the first and fourth cylinders over the inlet valves of the second and third.

Apart from the interest created in the Brush runabout and its sister car of greater pretentions, as a whole, the motor of this little car deserves special mention as showing what its designer has attempted to accomplish in the way of balancing the crank and piston groups. The single cylinder motor of the smaller car is counter-balanced in the usual way by means of weights set opposite the crank throws. The method of treatment of the twin motor on the larger car, is however, particularly original and novel.

In this machine, both pistons work on the same crank pin, the forces to be opposed thus being exactly double those existing in the single motor. Instead of placing the entire counter-balancing weight in one or two masses opposite the crank throws, however, balance is obtained by what the inventor correctly terms a "foolishly simple device." The weight necessary to oppose the vertical thrusts of the pistons and cranks is divided, one half being mounted in the usual way on the crank webs, and the other being placed on a secondary counter shaft mounted in an independent case at one side of the crank case and a little above the center line. This mass with its shaft, is driven by spiral gears from the crank shaft, and since it turns in the opposite direction from the crank shaft, exactly counteracts all horizontal forces set up by the rotation of the principal weight. At the same time the theoretical effect is to remove the vertical forces as well.

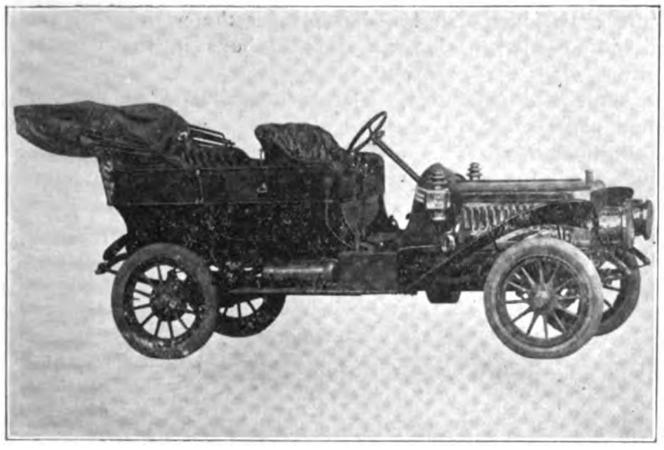
A secondary and radical purpose further appears as the reason for placing the auxiliary counter shaft above the crankshaft as well as at one side. The natural effect of the resistance to the rotation of the crank shaft of this (or any other) motor, which is developed by the load, is to capsize it in the car. The arrangement of the weights is such that in addition to correcting the internal vibrations of the motor a purely external and artificial vibration is developed. The object of this is to counteract by an average amount, the twisting or torque vibrations of the motor as a whole. However radical the method, certainly the result evolved, is an astonishingly smooth running motor, which is a credit to such a revolutionary undertaking.

Lubrication.

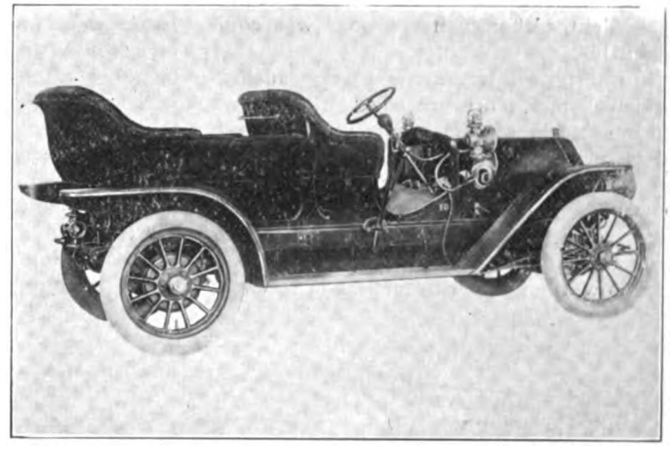
The lubricating question has at last become of sufficient seriousness as to be recognized as most essential to the life of the motor. While a poor grade of oil may be somewhat to blame, still, that the lubricating system must positively lubricate the wearing surfaces of a hydro-carbon motor, is becoming more and more apparent by the endeavors made each season toward the perfection of various devices. Placing the motor in the hands of novices has created a demand for positive lubrication under most exacting circumstances, and caused the development of systems of recognized reliability. This has been proved this year more than ever by nearly every motor being equipped with a force feed lubricator, either as a separate accessory or self contained within the motor crank case, as found in the Klink, Great Smith, De Luxe, Ellsworth and Imperial. In the Marmon system of lubrication an automatic gear pump forces the oil from the crank case, through a hollow crank shaft, to the various parts requiring lubrication. Several were equipped with two systems and where the pistons and crank pins of all the motors were not lubricated by force feed, it was accomplished by splash. The American Mors motor was equipped with an original lubricating system of its own, utilizing the lower part of the crank case as a reservoir, pumping the supply through a sight glass on the dash. From the sight glass a tube leads to the side of the motor brackets, entering a copper tube arranged within an outer tube or container, from which the distributing tubes lead to the various bearings. The inner tube referred to has several small holes to emit the oil to the outer tube, the location of which it is claimed, is very essential to equalize the flow of oil therefrom at any angle the motor may assume while on the climb or descent of steep grades or tipped to the side.

Ignition.

Inspection of the motors exhibited brought to light the effects of the great energy expended by the manufacturer to overcome the difficulties experienced with the ignition system. This examination of the various products showed the almost universal predomination of the jump spark, as was a foregone conclusion. Fifteen makes were equipped with double ignition, one with make and break and jump spark, two with make and break alone, the balance utilizing high tension magneto and storage battery with coil, coil with storage battery or dry cell, high tension magneto with dry cell and coil, or high tension magneto only. Several equipments with magneto consisted of a single coil and distributor, the make and break, of course, utilized a low tension magneto. Among the cars mounting the high tension magneto as a stock feature may be cited the Frayer-Miller (Model C), Glide and Mors. Low tension make and break systems were applied to the Rainier, Garford and American Mors. The National, Cleveland and Stoddard-Dayton (8-G) cars were among those fitted with double ignition. The adoption of the magneto is worthy of note, and so common is considered the demand that arrangements are made for its introduction on cars not regularly so equipped, but in no case was the addition of the high tension magneto a gratis opeion. Storage batteries and dry cells were optional in most cases. Commutators or timers were generally found to be of the ball contact or revolving roller type.



Bearings.



While ball bearing motors, as they are called, are equipped with ball bearings for the crank shaft and cam shaft bearings, it is very interesting to note that no engineer had the temerity to place ball bearings on the crank pin. Several firms, such as the makers of the National, De Luxe and Mora, for example, exhibited ball bearing crank shafts, and one concern equipped the first bearing with balls, the rest with anti-friction metal. The general practice as observed, embodied bronze in the motor bearings throughout, either white, phosphor, or other alloys, and a few manufacturers still adhere to plain babbitt, which speaks for itself. While several claims were made that no changes were apparent the stress invariably laid upon the length of bearings tended to convince the observer that longer bearings were being made or had been anticipated for next season.

Carburetters.

Another problem that has to some extent been settled is the use of carburetters made by the motor car manufacturers

Digitized by Google

themselves. There now are so many standard makes of carburetters, made by carburetter specialists and so many of them were in use on the cars at the show that it pointedly suggested that the automobile manufacturers have decided to leave the carburetter design and manufacture alone. Several individual makes of carburetter were shown, however, among them types of both single and multiple jet, also several equipped with hand regulation of needle valve or auxiliary air from the dash. The demand, however, appears for the type with the jet located in the center of the float reservoir.

A constant level carburetter was found on the Brush motor which resembles the type used in the stationary gasolene motor field. A small diaphragm pump forces the fuel from the tank to a constant level reservoir, the level of which is governed by an overflow return to the tank, the height of the overflow corresponding with the top of the nozzle in the induction tube. Other cars shown with original carburetters included the Maxwell, Acme, Gaeth, American Napier, Chadwick, and the new Fay-Ellsworth product.

Minor Details.

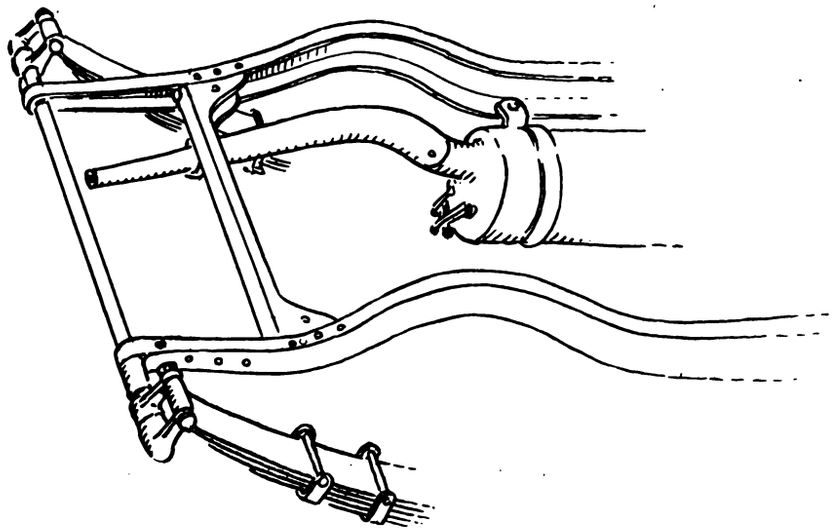
Practice places the throttle and spark levers on the steering column; in only a few instances is the throttle interlocked with the clutch mechanism. The use of the pedal accelerator appears to be growing, however. As the years progress, details of a small nature can be discerned, as being adopted by different makers. Fibre washers and plugs are being used to a considerable extent to silence the clatter of the valve mechanism. Manifolds, especially those of the inlet, are receiving more attention. A most compact "equal path" inlet manifold was to be found on the Gearless six-cylinder motor. A similar arrangement in a general way, but with more liberal areas and less abrupt bends, appeared on the new National sextuple engine. The new four-cylinder model of the same mark, has a perfectly straight distributing chamber. In the Garford engine, the two cylinder groups are fed from opposite sides of the mixing chamber through liberal pipes with long, sweeping bends. Oddly enough, in the Chadwick Six, however, no such provision is found, the gas being inducted through spherical chambers at the cylinder groups, but in such a way that while the second and third cylinders get a direct draught upon the carburetter—which is centrally placed—the two end groups must draw their gas more than twice as far. A restriction in the area of the branch to the middle group, probably is intended to counteract the tendency to unequal distribution. The aim in general is to give length, so that the gas has an equal amount of friction and the same number of turns to make, to reach each cylinder. Very few motors contained any offset, and the valve locations were about equally distributed on the sides, though the growing use of valve-in-the-head constructions, provided an interesting variety.

The tendency seems to be to cast the cylinders in pairs as a majority were so constructed. It was an exception to find the equipment without a pump, very few using the thermo-syphon system. Such as the Atlas 2-cycle, and the Maxwell and Gaeth systems, however, proved remarkable and convincing exceptions to the rule. It might be said, as a whole, cams were pinned and keyed on the cam shaft, one instance wherein in addition to both methods cams were brazed, one instance where cam and shaft were forged in one piece, and two cases where they were cut from steel and case hardened, proving exceptional.

Two 2-cycle engines were to be found. They were the products of the Atlas Motor Car Co., and the Reliance Motor Car Co., the former a runabout, the latter a truck. In design the Atlas differs from any 2-cycle engine in use. The exhaust ports extend all around the cylinder, the crank case charge entering the cylinder through the center of the piston from ports in the piston wall corresponding with cylinder wall ports below the exhaust ports.

Apparently the wholesome influence of the horsepower controversy which has been raging so brickly for several years, is at length beginning to be felt. This is noticeable in the use of single and double ratings, as well as in the conservatism observable in many instances. For instance, out of a rough count of half a hundred representative makers exhibiting, full 50 per cent, rated their motors in a single term. A scant 20 per cent. employed both single and double ratings on different models which they produce, while only 30 per cent. of the entire number had recourse to the misleading hyphenated expression.

FRAME CONSTRUCTION.

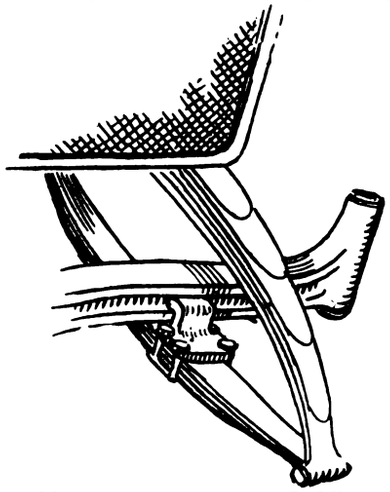


Pressed steel frames may be the order of the day, but the fact remains patent that many frames are in use which are not pressed steel—plain rolled channel steel or angle iron being frequently mistaken for the more expensive article by the uninitiated, in which understanding, he is sometimes encouraged, it is to be feared. A remarkable fact in this connection, is the use of the reinforced or trussed wood frame by several makers, such as Grout, Brush, Cameron, and Smith. Their staunch allegiance to the type, introduces some little question as to whether or not its abandonment by many of the makers in years passed, was well advised, all things considered.

However that may be, the majoroity at present adhere to the so-called pressed steel frame—some of them developing strikingly beautiful designs, as for example the Stoddard-Dayton, Cleveland, and De Luxe frames, the latter of which is of inverted U pattern with reinforced thickness at the open edges. The other two are arched above the rear axle, in order to obtain proper clearance for spring action without disturbing the plain surface of the chassis itself. Of course the same motive develops the dropped frame constructions of the Rainier, Garford, and others, not to omit the "double drop" scheme applied to the new Imperial. The use of a 3½-inch drop both in the front and rear ends of the chassis in this instance was cause for not a little comment at the show, though the absolute necessity of the design was not perfect-

Digitized by Google

ly evident, although its purpose was commendable.



Formerly, sub-frames were very much in evidence, and more recently they have seeemed to be growing more and more out of favor. The use of the gearset mounted on the rear axle, the planetary, the unit power plant complete, and various other devices, have served to undermine its former strong position. Nevertheless, at the present show, the number of makers of standard types of car employing the sub-frame, and the number avoiding its use as studiously, appeared to about the same.

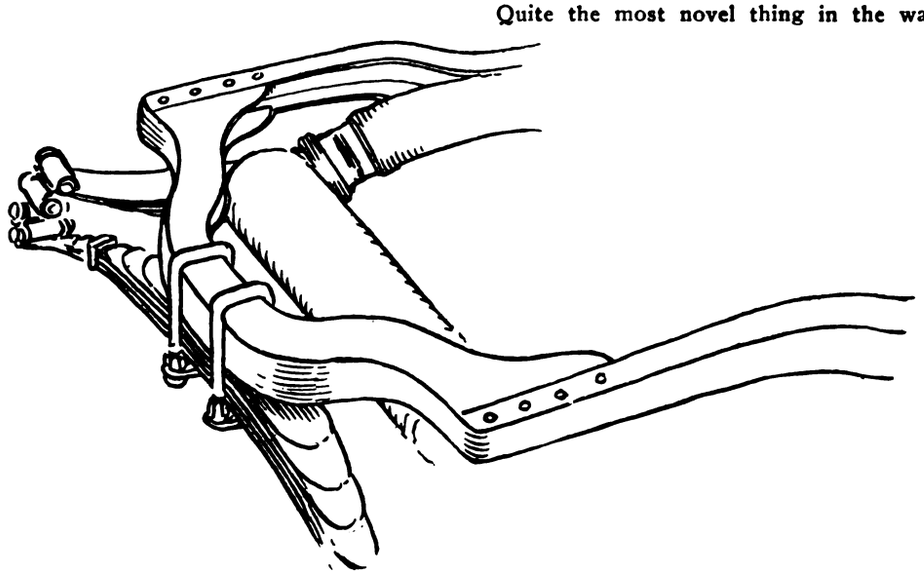
Stoddard-Dayton Rear Frame Arch.

Spring Suspension.

Generalizing on the matter of spring construction, it was observed that while something like 80 per cent. of the cars mounted semi-elliptical springs in front, only about 30 per cent, had a similar equipment in the rear. This was counted for by the evident fact of the growth of the three-quarter platform type, on certain cars, as well as by the continued use of the full elliptic pattern of rear suspension on others. The relative proportions stood at about 12 and 15 per cent., respectively. Full elliptic springs in front, were found on a round half dozen cars, while two, the Cameron and Elsworth, mounted three-quarter elliptics.

Marmon Understrung Saddle.

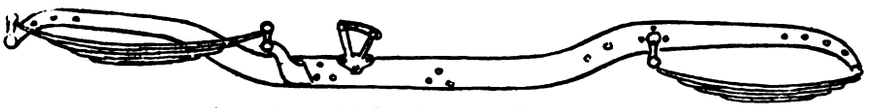
A noteworthy point in the suspension of the new water cooled Marmon car, which, like its predecessors, has full elliptic springs, is the hanging of the lower side of the front members below, instead of above, the axle. To this end a special form of suspension is used, taking the form of a couple of grab hooks, which grasp the lower flange of the I-beam axle. The effect is to lower the forward part of the frame several inches, and is required by the double three-point system employed.



On the National runabout was seen a device for preventing the weaving of the frame over the rear three-quarter platform suspension, which was termed a "parallel bar," and which took the form of a guide mounted on the chassis and engaging a thin block shod with camel's hair fabric, which was attached to the lower spring member near the axle. The device, though readily mistaken for a shock absorber, was said to be designed solely for the purpose of guiding the spring oscillations in the vertical direction.

The Ellsworth springs were distinguishable from the fact that instead of the usual articulation at the jointure of the upper and lower members of the three-quarter and full elliptical elements, the ends were drawn out flat and secured by passing through them a single rivet. The leaves, instead of being kept in alignment by "kitten ears" such as were found on many suspensions, were ridged through the center on one side, and grooved on the other, all the leaves thus fitting together compactly yet without any possibility of disalignment. The same scheme was also applied to one or two other systems.

Lansden Spring Suspension.



Quite the most novel thing in the way of springs, was the original system employed in suspending the Lansden electric touring car, which was bolstered at each corner of the frame upon a set of four helical springs, mounted on a broad seat on the axle. A close rival to this in point of novelty, was the method of hanging the Brush runabouts. This consisted in the use of four helical springs, mounted over the corners of the frame, and affixed to vertical rods which ran down through them to the axles below, thus giving a free suspension, at the same time providing a stop to violent plungings by the presence of the axles

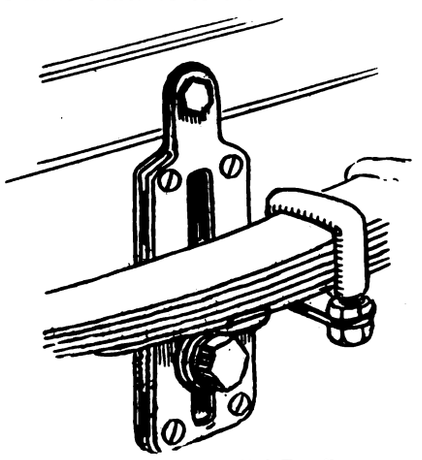
Extended Rear End of Rainier Frame.

Digitized by Google

against which the frame would bring up on such occasions. The use of radius rods which also combined the functions of shock absorbers of the friction joint variety, also was distinctive, and exclusive, although several makers regularly equipped their machines with absorbing devices of one sort or another, one or two, like the Austin, producing their own.

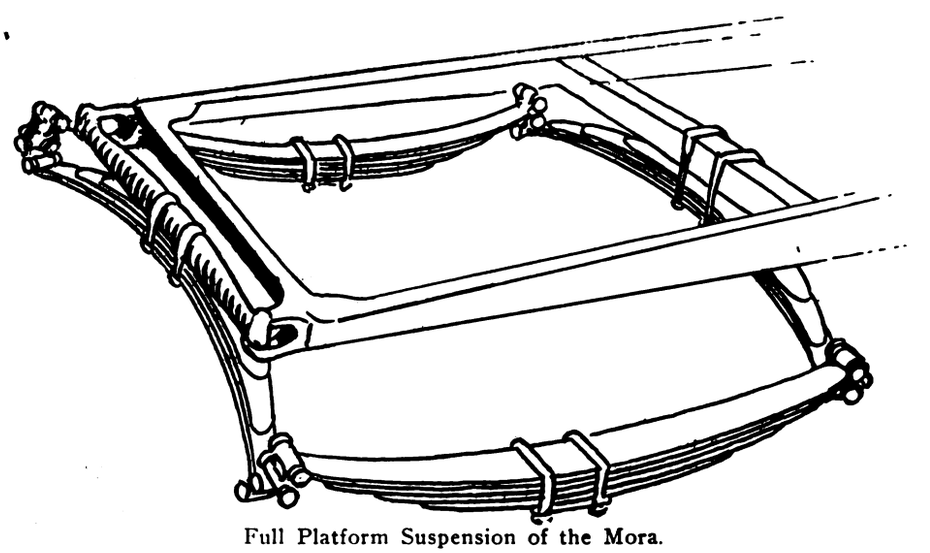
Imperial Double-drop Frame.

The full platform suspension of the new Mora six-cylinder cars proved to be exclusive, also. The two cross members were clamped to the frame cross suspension members in the longitudinal center of the vehicle, while the side springs, of course, were mounted on the axles. The result was a cradle in effect, which was said to ride very easily.



Variety in Clutches.

Plainly the multiple disc type of clutch is growing in favor among the makers. The diversity of its application, however, as well as the fact that there seems to be no settled limit either as to the number of discs to be employed, nor of the metals themselves, resulted in an almost bewildering variety of devices of this nature. Thus while the Premier cars are driven through a clutch having 53 discs, all of steel, and the Cleveland, through one having 50 discs, the Austin cars have a 40-disc clutch (mounting 10 more discs than last year), the Glide, one of 12 discs, 12 inches in diameter, and the Great Smith, one of 23, bronze and steel discs.



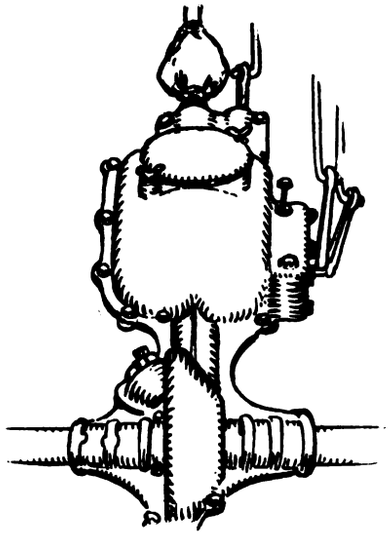
The ring type of clutch, in distinction from the true multiple disc variety which usually has a greater number of elements of smaller diameter, begins to become a factor in the show. Thus the Continental, with 5 rings, Jackson with 6, and Imperial with 3, one of steel and two of bronze, the latter being fitted with cork inserts, are worthy of study. Incidentally, the use of cork inserts is practically universal with this type, and it also is growing sporadically among others as well. Thus the De Luxe clutch is of the plain cone type, the male member being of bronze fitted with inserts, the female member being the regular metal of the flywheel. The cone clutch of the Mora racytype is leather faced in traditional fashion, but also is provided with cork inserts, which replace the more common springs set under the leather.

In a general way it way be said that about 40 per cent. of all clutches seen at the show were of the multiple disc type; some 35 per cent. or more were of the cone type, either plane or inverted; 10 per cent. answered to the description of the ring type, and the remainder were scattered among the several radical devices. Among these, the Wayne internal expanding type, contrasted with the Gaeth contracting clutch, already mentioned in connection with the actuating devices. The metal to metal cone device of the York-Pullman cars, in which cork inserts were used, and the radical coned clutch of the coiled band type used on the Ellsworth car, as well as other occasional departures from the ordinary furnished plenty of variety for one who was willing to seek it out.

The majority of designers still place the clutch in the flywheel and connect it to the drive shaft of the change gear system, either by direct shaft or through one or two universal joints. Two possible variations present themselves forcibly, however, one is the arrangement required when the change speed gearing is mounted on the rear axle, when the drive shaft and usually the torsion tube as well, is transferred from the back to the front of the gear box, thus bringing a new sort of strain upon the clutch itself, unless the tendency to racking is successfully counteracted by the manner of supporting the forward universal joint. A typical illustration of the way in which this system may be worked out, appeared in the new Pennsylvania Model C, while further possible developments along the same line were to be found on the Glide, Frayer-Miller, and Dragon roadsters. The second possible variation in the placing and use of the clutch is to enclose it in the gear case, or in a separate compartment of the same casting, thus eliminating the necessity of interposing a flexible connection between these two elements. The remarkably neat design of the Maxwell power plant in which this feature is embodied, shows what may be done along this line, while of the several other systems carrying along the scheme, the Crawford and Welch —the latter with its two independent disc clutches, and the Smith, with its single lever control system, are interesting examples of the wide variety possible.

National "Parallel Bar."

Full Platform Suspension of the Mora.



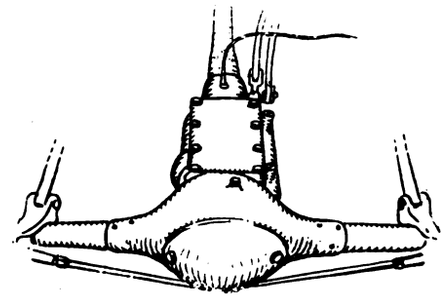
Change Speed Gearing.

Coming to the two principal groups of planetary and sliding gear speed modifying devices, there is room for unlimited variety, not a little interest centering about the relative importance of the two from year to year. While the continuous growth into favor of the sliding gear type of transmission in its various forms is very marked, the planetary group still finds well deserved favor with a few makers. Notable among these are the builders of the Atlas cars, who this year have brought out a planetary gear of their own design which is entirely of the spur type and has no internal annular gears. This device also mounts a very neat multiple disc clutch of the single metal variety. The planetary gear of the Brush runabouts is unique in several ways, the noteworthy feature being the use of but a single set of pinions which are counterbalanced in the case to prevent vibration. Another remarkable point about

Digitized by Google

this device is its lubricating system, which is of the force-feed order, circulation being induced by the effect of centrifugal force, and centrifugal force alone. The friction contact planetary system of the Gearless cars, also excited no little comment.

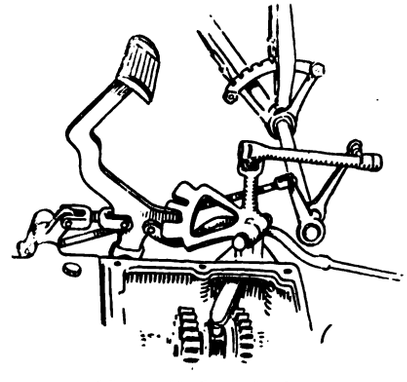
There were shown approximately four times as many sliding gear devices as planetary, however, and hence the bulk of interest centered about them. For the most part they were of the three speed direct-on-high pattern, a fair majority of those applied to the medium powered machines being either of the vertical or inverted vertical pattern such as those of the National, American Mors, Dorris, Mora, and the brand new Colt runabout. A decided advancement in the use of the selective method of actuating the gears, was brought out



Overland Planetary Gear.

in this connection, the ratio between the progressive and selective types being probably as high as nine to one when the new models alone were considered, but counting the entire range of pleasure vehicles on display, the ratio was reduced to something like four to one. The point is interesting, however, as showing an unmistakable growth on the part of the selectively actuated gear. The use of the friction drive on the Lambert and Carter cars was for the first time supplemented by the appearance of the same sort of transmission on machines of the buggy type.

Although several makers had improved their transmissions to some extent by using ball or roller bearings instead of the plain bushings of last year, and though ball bearing change gears were numerous, nothing appeared to indicate a strong increase in the use of anti-friction bearings for this purpose. The several gearsets mounted on the rear axles, however, such as the Pennsylvania, Glide, Frayer-Miller, Dragon roadster, Wayne and Cameron—the latter mounting a peculiarly simple and effective system of original design—were, with perhaps a single exception, mounted in anti-friction bearings.



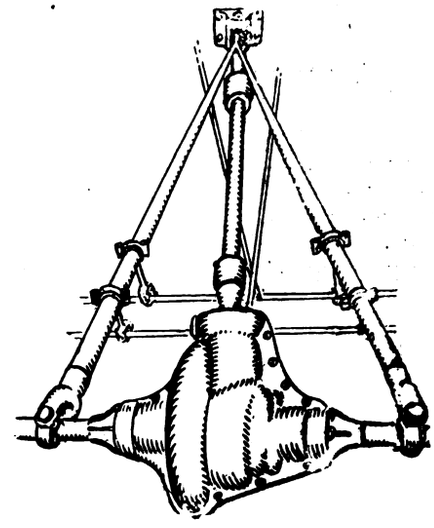
Counting the new models of medium and high power only, it became apparent that fully nine times as many cars were driven by cardan shaft systems, as were driven by

Pennsylvania Rear Axle.

chain or chains. Yet taking the show around, including models of all sorts, this proportion was reduced to something like four to one. The result in either case, merely confirms the impression gained by even the casual on-looker, that this was above all else a show of shaft drives.

This conclusion naturally developed a very interesting field for study in the mounting and general design of the live axles. Here the usual variety was discoverable, the evidently popular method of mounting the axle in the chassis being that known as the "spring drive," in which the rear springs are shackled only at one end and take all the traction load due to the driving effort through the ends which are pivoted directly to brackets or frame sills. With this system, the torsion bar or bars may be shackled to the chassis with absolute freedom of motion, except in the plane at right angles to the axle. With the older system of double shackling the springs, naturally radius and distance rods must be used. The

Maxwell Interlocker.



use of torsion tubes, housing the driving shaft and also preserving its alignment, was found to be quite extensive.

The Moon rear axle group in which the two torsion bars were brought together and joined in a universal suspension above the driving shaft, was quite an unusual arrangement; while the simplicity of the Dorris system, in which the spring drive principle was applied to a three-quarter platform suspension, was sufficiently marked to draw attention directly to the arrangement. The extremely simple spring drive system of the Wayne, also was creditable.

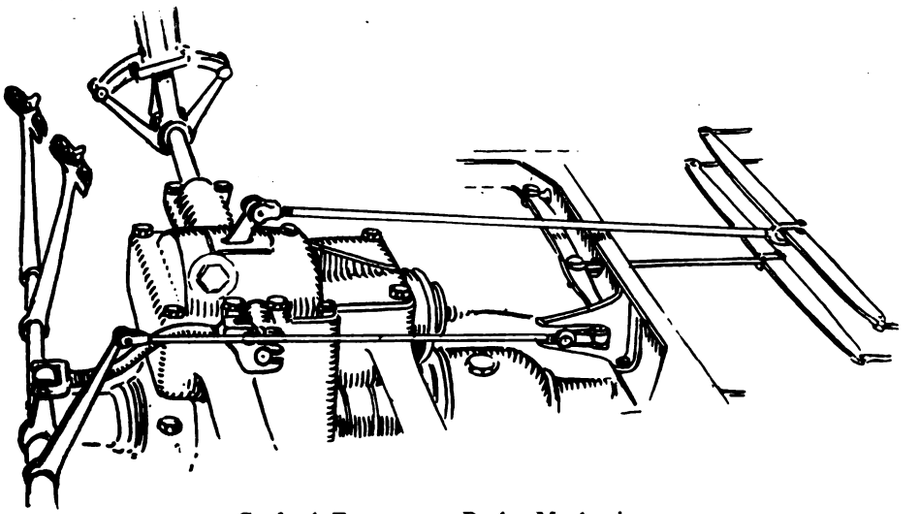
Chain drives, both single and double, have been in use for so long as to be ameanable to litttle or no variation from the well tried plan of radius rod drive, which is universally employed. Oddly enough, the chain system appears to be confined largely to machines of both high and low extremes of power and weight, cars in the middle range being for the most part shaft driven.

Improved Brakes.

A general movement, set on foot during the past summer, has developed a degree of attention to the braking problem which is as commendable as it was requisite. Gen-

Moon Torsion Group.

erally speaking, the braking areas have not been increased to a remarkable extent, so far as could be learned from the average stand attendant, but the provisions for application of the brakes, have been re-designed in so many cases as to excite considerable interest.



In the Garford chassis, for example, instead of a mass of rigging leading from the side lever around to the rear wheel brake levers, the telescoping shaft upon which the gear changing rock shaft rides, is continued through the upper part of the gear case, which contains the selective mechanism, where it is surmounted by a short rocker arm, playing in a slot in the top of that portion of the case. A straight rod leading from that point back along the center line of the car, is attached to a flat horizontal equalizing bar extending clear across the frame and working in suitable slots in the side members. From its extremities, the brake links are led in a straight line to the brakes themselves.

Several cars now mount the compensating brake beam extending across the frame, among them being the Moon—in which the beams for both brakes are under-hung from

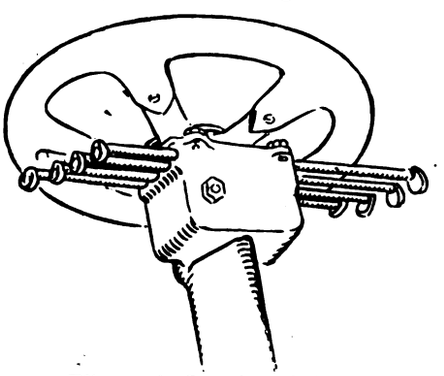
Digitized by Google

the torsion member—the Dragon, and Marmon cars. The Maxwell line, is uniformly supplied with cable equalizing devices running over little sheaves mounted substantially on the frame. The same device was found on the Ellsworth car, which has four independent brakes, two on the rear wheels, and two on the countershaft—the latter being readily adjustable from the side of the car and without the use of a wrench. Cable equalizing systems also are employed on the Continental, York-Pullman and others.

The short equalizing beam found on so many of the cars was in the case of the Dor-

Garford Emergency Brake Mechanism.

ris, removed from its usual horizontal position within the frame to a vertical one at the right side, where it is readily accessible for inspection or lubrication. The service brake in this car is mounted just back of the gear case, and takes hold of a drum over the drive shaft. In most of the cars, however, the external-internal pattern of rear wheel brake was employed. In some cases, extraordinary precautions were taken to improve the brakes to the highest possible degree. A noteworthy example of the care outlayed in this respect, was the internal expanding brake employed on the Premier cars for the coming year. This consists of a massive bronze ring, made of a solid piece, and having a series of cork inserts sunk in its working face.



The cone clutch type of brake employed on the Great Smith cars last year again appears, but in reversed position and enlarged form, the result being greater power of retardation, and a safer method of application since the entire mechanism now acts in tension. It may be said that the spirit which prompted this alteration is apparent everywhere, the tendency being to make the braking mechanisms more mechanical than they ever have been before.

Steering Devices.

The Ellsworth steering connections mount a special feature in the shape of extensions to the rocker and knuckle arms, which terminate in flat buttons something like an inch in diameter outside the connecting links, and are intended, it would appear, to prevent those members from dropping entirely in the event of a broken ball and socket joint. Like a number of other parts of this car, they appear to be extremely light.

This arrangement, together with the worm and bevel combination gear employed on the Frontenac car, the somewhat similar gear and rack and pinion device of the Crawford machine, and the plain rack and pinion which continues to be used on the Dorris cars, and which is innocent of any checking or irreversible properties, constituted the chief points of interest in the way of steering gears. The designer, however, probably would be interested in following the layout of the gears, and noting the apparent growth of the custom of placing the drag link behind instead of in front of the axle.

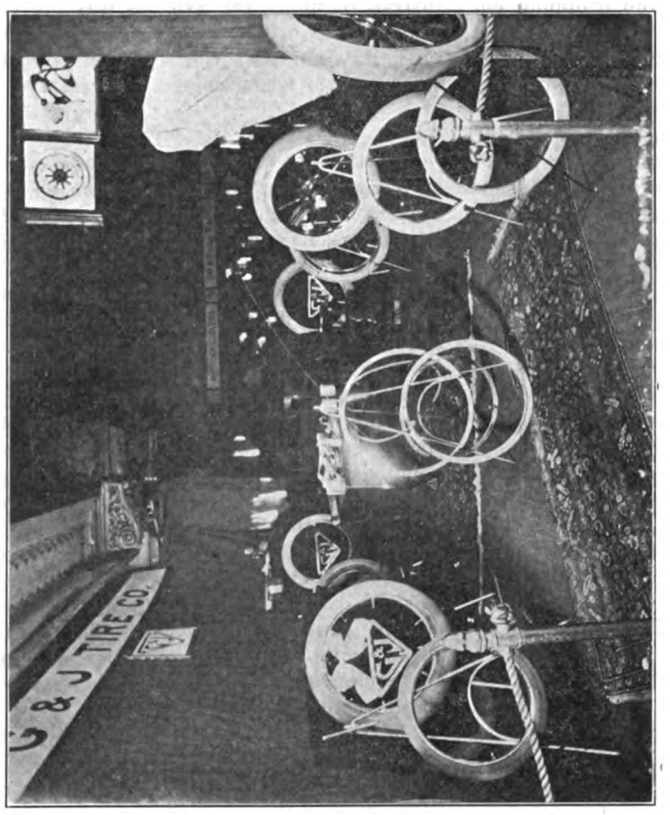
As a matter of fact, some 45 per cent, of the cars shown at the Palace, were equipped in this way, the connecting rod from the

Ellsworth Steering Column.

rocker arm to the knuckle being passed under that member in the majority of cases. A round half dozen of cars, and among them the Dorris, Mitchell and Wayne, had their connections on the left side of the car. The result in each case was that the steering gear itself came well forward in the chassis and permitted the steering column to be given an extremely long rake. Some 5 or 6 machines, had connecting rods led over instead of under the axle, as was the case with the majority, and in order to accomplish this end, a considerable offset in the steering arm was frequently necessary.

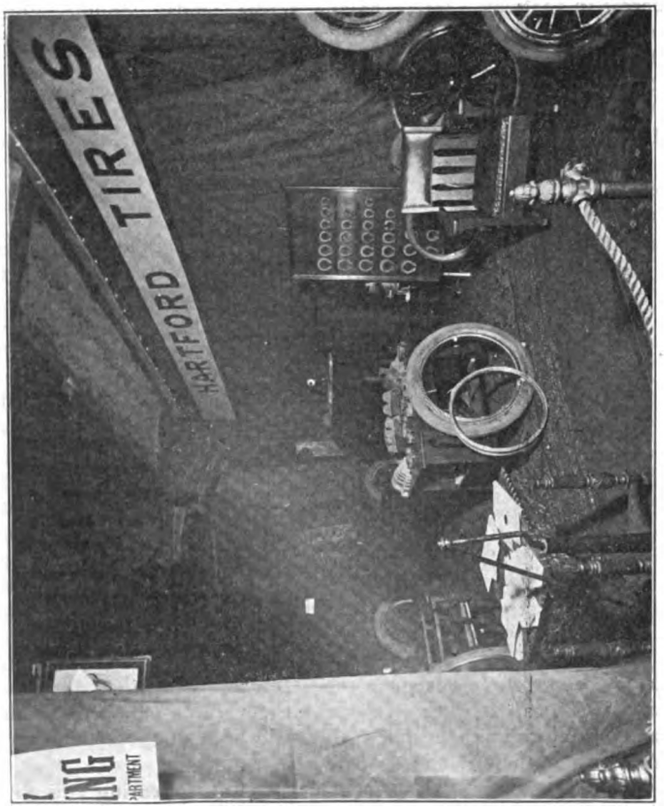
The Electric Vehicles.

Mention has already been made of the spring mounting of the Lansden electric touring car. This machine, which, but for its springs, has the aspect of a full-fledged gasolene touring car, is a rather graceful, even if massive vehicle, having a trussed wood frame, under-hung battery equipment, double side chain drive and single motor. Its wheel base is 126 inches, and it is equipped with solid rubber tires. Outfitted with the Edison battery, it is rated for speeds up to 30 miles an hour, and has a nominal mileage of 100 miles on one charge, taken at a speed of 20 miles per hour, average. Two other electric vehicles were also shown on the Lansden stand. One, a typical covered express wagon of sturdy proportions, and the other a florist's delivery vehicle, panelled in gold leaf and painted all in white. Both the commercial types are equipped with the Edison battery and single motor equipment.

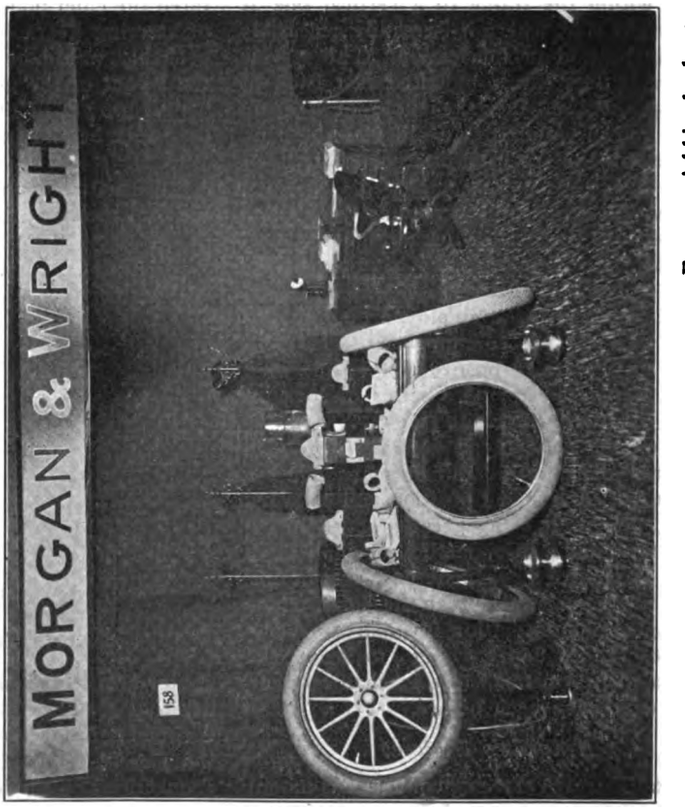


The only other exhibit of electric vehicles was that of the Anderson Carriage Co., makers of the Detroit Electric. This proved to be a neat little vehicle of the medium sized runabout order, and revealing these features: Pressed steel frame, semi-elliptic and full elliptic springs, front and rear, the latter having scrole ends; double chain drive; tubular axles; leather chain and mud guards; and a single motor fully housed. It is made to run on a 24-cell battery, and is guaranteed for 100 miles per charge. It was displayed with both victoria and inside driven coupe bodies.

The Motor Buggies.



For the first time at any New York show the buggy type of runabout made its appearance in sufficient numbers to constitute a veritable "section" of its own, and a corner of no little interest as well. In all, seven makers staged machines answering to this description, all representatives of a rapidly growing class of makers of the middle west, who are coming into notice at a rapid rate. The Holsman, the only one of the group which had been seen in New York before show season, appeared with several improvements, among them being a new type of driving cable, thought to be essentially durable as well as flexible, a new motor, and a new form of motor suspension, comprising the use of a couple of tubular members placed transversely of the frame, and resting on a sort of sub-frame supported under the body sills, and at a distance of several inches below it.



The Reliable-Dayton appearing this year in thoroughly redesigned form, had an opposed twin cylinder motor in front, a band clutch, sliding gear transmission with coun-

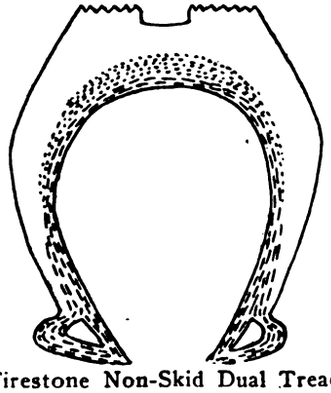
Digitized by Google

Four Allied but Competing Exhibits.

Digitized by Google

tershaft enclosed in a single housing, the final drive being by double side chains. In the Hatfield a friction disc type of transmission is employed, as in the Schacht and Pontiac. The latter, in addition to its friction transmission, has a special form of friction clutch device, taking the place of the differential on the countershaft, and intended to operate by automatically releasing the outer wheel on a turn, from the driving relation. The Kiblinger buggy has an air cooled motor, planetary change gear and double chain drive to each of the rear wheels. The horsepowers of these machines ranged from 8 to 15. All are of the true buggy type, with high wheels.

Commercial Vehicles.

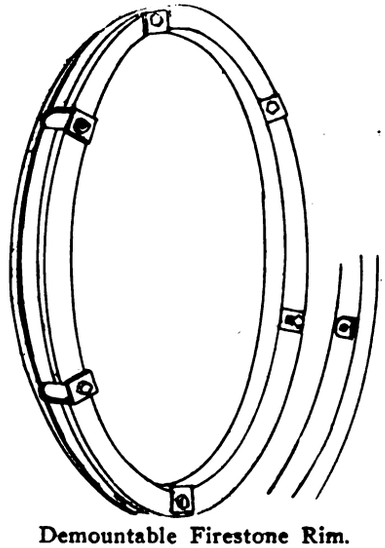


While the representation of commercial vehicles was not strong numerically, the exhibits staged occupied a considerable area, and "bulked" large and interestingly. The Rapid chassis, which is adaptable to a variety of purposes, was shown with no less than ten different bodies, the power and size of the chassis being suited to the work in hand.

Because of the simple construction of the two-cycle motor mounted in the Reliance trucks, which also were shown, a high degree of interchangeability is claimed. The cylinder units being of the same size, only a single series of standard parts need be carried by any owner for any type of vehicle, or for any number of different types. Further than this, the motors may be transposed from one chassis to another, thus making it possible to increase the engine power on occasion, and without rebuilding the vehicle. The Reliance sloping platform stake truck shown, was claimed to be an absolute innovation in the motor truck field, and particularly convenient for loading.

Among the several features observed in the construction of the new one and three-ton Logan trucks, were the use of massive radius rods for both front and rear axles, the use of ball bearings of the annular type in the change gear boxes, the arrangement of the four-cylinder vertical motors in front, under the footboard, and the heavy and serviceable looking brakes, of which two were mounted on the counter shaft, one on the driving shaft, and two more on the rear wheels. The heavy Manhattan trucks and sight-seeing vehicles have vertical motors, and an original form of change gear, selectively actuated, in which a direct high speed relation is obtained, the lay shaft being disengaged and stationary at same time. The mechanism of these, as well as the other commercial vehicles was impressively heavy and substantial looking.

The Tires and Their Appurtenances



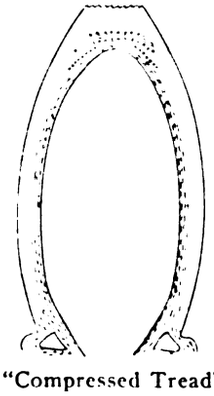
At the space occupied by the Diamond Rubber Co., of Akron, O., two new members of the Diamond tire family made their debut. The first of these was the "electric" tire, designed for use on electric vehicles in city service. Its chief feature is a very soft yielding outer case which completely absorbs the ordinary road shocks and obstacles met with in city driving. This casing is too tender for heavy cars or country roads, but is said to be entirely satisfactory for its special purpose and to reduce current consumption by about 25 per cent. over ordinary tires. The second tire, a solid, was new in material only, its form being on the lines of previous tires, but its material being white rubber, for which great

Firestone Non-Skid Dual Tread.

durability claims are made. The line of "stand pat" models was as complete as ever, the Diamond wrapped tread construction being featured, and the Marsh rim demonstrated.

In addition to the tires designed for use with the special Fisk rims, the Fisk Rubber Co., of Chicopee Falls, Mass., showed this year tires made for use on regular clincher rims, thus providing a complete Fisk line. Wrapped tread construction also characterized the 1908 samples shown. The display was enlivened by exhibitions of quick tire changing with the Fisk rim arrange-

Demountable Firestone Rim.



ment which permits of replacing a punctured tire with another fully inflated tire complete on its own rim.

Goodyear tires, made by the Goodyear Tire & Rubber Co., of Akron, O., were shown both complete and in section in a great variety of sizes and shapes. The Goodyear contingent were pleased at the census of cars exhibited which gave the Goodyear detachable rim a splendid showing. The operation of the rim was demonstrated.

Morgan & Wright, of Detroit, Mich., the Hartford Rubber Works, Co., of Hartford, Conn., and the G & J Tire Co., of Indianapolis, Ind., all featured new hard bead clinchers, with wire in the bead, the tires being suitable for use without lugs. The Midgley non-skid tread and the Midgley rim were also prominent in the displays.

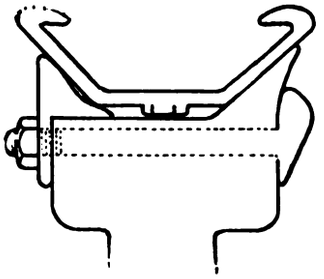
A deep groove in the center of the tread and corrugations on the raised portions marked the new dual, non-skid tread offered by the Firestone Tire & Rubber Co., Akron, O. The new Firestone demountable rim was also shown. The wheel periphery is recessed in places to engage studs on the rim which holds the inflated tire, and the latter, after being put on the wheel is clamped at the side by suitable fastenings. The studs and recesses prevent the creeping of the dismountable rim on the wheel, and the clamps secure it from lateral play. The regular types of Firestones in pneumatic and solids constituted the remainder of the exhibit.

The Continental Caoutchouc Co., of New York, exhibited the new Continental rim for the first time, an industrious colored

Michelin "Compressed Tread" Design.

boy in uniform being kept busy lifting a completely inflated tire and its rim on and off the wheel. The tire which fits on the wheel is sufficiently greater in diameter to slip on or off very easily when desired, and to prevent its rusting or "freezing" on; but when the wedge shaped clamps are applied, the rim is rigid with the wheel and is capable of withstanding all strains which might seek to loosen it. A section of a very large Continental tire for special service was shown, in addition to the regular

Digitized by Google



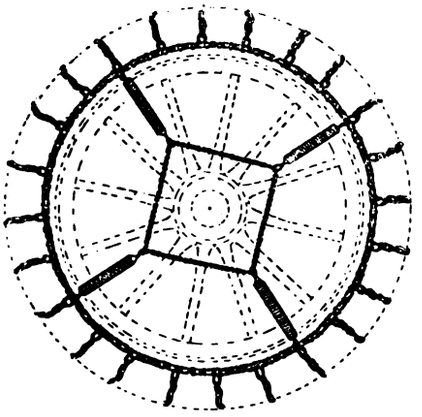
Continental types of clinchers with lugs.

Two new models of tires were shown at the space of the Swinehart Clincher Tire & Rubber Co., of Akron. One was a dual tire the halves of which were made in the usual Swinehart solid section, but in the middle of the rim, between the two tire parts a heavy chain was introduced, its function being to act as a non-skid and to strengthen the whole tire against lateral strain. The other was the new "cullular" tire, which is a square sectioned solid tire with numerous plain holes from the tread directed tangently toward the axis. A semi-pneumatic effect is ascribed to this construction in conjunction with a sucking action which lessens skidding.

Many an inquisitive hand was burned at the exhibit of the Newmastic Tire Co., of New York. To prove that the compound which the company offers as a substitute for air will not lose its elastic consistency when subjected to great heat such as it might encounter through the friction of fast road work or the action of the sun, a large piece of the compound was placed on an electric hot plate, where it broiled and scorched but did not melt. Unaware of the calorific altitude of either the electric plate

Continental Demountable Rim.

or the piece of compound resting on it, visitors were prone to finger them, always with immediate and violent results. Polite salesmen were kept busy restoring the unfortunate ones to good humor by explaining the nature of the test and pointing to the victim's own experience as an evidence that the Newmastic was really hot. The Parker rim, which consists of a clincher rim split in the center and having the distance betweeen the two clinchers variable according to the degree that the side bolts are tightened up, was also shown. It was originally designed to make easier the application of Newmastic filled tires, but is now offered for regular air inflated clincher tires as well. With the latter the air pressure in the tire may be increased by simply binding the clinchers closes together instead of pumping in additional air, the operation requiring only a tightening up of the bolts.



Wrapped tread construction was disclosed as a 1908 feature of Ajax tires, at the exhibit of the Ajax-Grieb Rubber Co., New York City and Trenton, N. J. Smiling assurances from the "Ajax Girls" on the walls tempted the visitor to enter and discuss the Ajax 5,000-mile guarantee which will obtain for the coming year as heretofore. The tires were exhibited in a number of sizes.

The Empire Automobile Tire Co., of Trenton, N. J., had an exhibit that was severely simple, but which was inviting as an oasis of rest since it had a welcome for friends who wished to sit and watch the crowds or read the trade papers. The 1908 Empire tires were shown, the emphasis being laid on quality rather than on any rad-

Digitized by Google

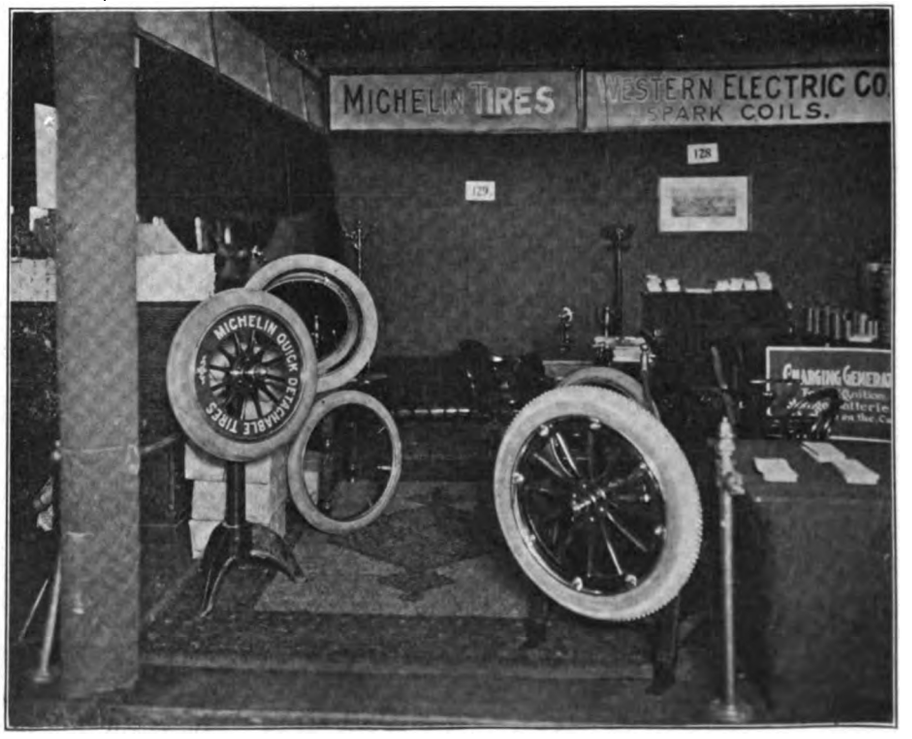
ical new feature of design. In this respect the exhibit resembled that of several other manufacturers with displays of tubes and casings.

American made Michelin tires executed their official bow to the public in the exhibit of the Michelin Tire Co., of Milltown, N. J. The feature of the exhibit was the new "compressed-tread" which made its first appearance in the United States on this occasion, although it already has a trail of racing glory behind it in connection with European contests. The construction of the tire is such as to compress the rubber of the tread from each side when the tire is inflated. This effect is obtained by making the casing proportionately narrow, with the inner side quite pointed toward the tread.

Snugging Device for Weed Chains.

An exceedingly stiff arch of canvas concaves over the air space and when the tire is inflated the canvas arch straightens out to some extent and in doing so compresses the rubber tread which backs it. It is claimed that practice has shown remarkable results for this feature, cuts and gashes in the tread being immediately compressed tightly together again instead of being opened and distended by the air pressure from the inside. The full Michelin line also includes the flat tread type clincher, the anti-skid clincher with steel rivets and leather tread, and a quick detachable round tread type with hard wire bead, the latter made only for the American trade and in American sizes. It is supplied in both rubber and anti-skid tread.

Leather covered inner tubes occupied a prominent place in the offerings of the Leather Tire Goods Co., of Newton Upper Falls, Mass. A new tire armor of linked metal parts was also part of the exhibit, together with metal studded leather tread protectors and non-skid straps.



By the use of four spiral springs to a wheel the Weed Chain Tire Grip Co., of New York, has hit upon a successful method of keeping the chain grip snug to the tire without binding, doing away with the rattling of the chains against fenders or rods, an annoyance which sometimes occurred when the chains were loosely fitted. The springs are arranged quadrilaterally and

draw towards the center of the wheel. Since they are fastened to the side chain to which all the cross chains are attached, the latter are kept close to the tread. The device was shown mounted on a wheel. A non-skid grip for solid tires was also shown. It consists of linked plates across the tire tread instead of chains, the plates immediately over the tread being broad and flat, but with rectangular holes in the center.

Labelled with the names of the cars on which they are used, the showing of the Midgley pressed steel wheels was significant of the growing popularity of these products of the Midgley Mfg. Co., of Columbus, O. Sections of the wheels, indicating their construction and assembly were available to those who took an interest in the subject. The new Midgley rim, with its removable flange and facility for taking either clincher or Dunlop type tires was also in view.

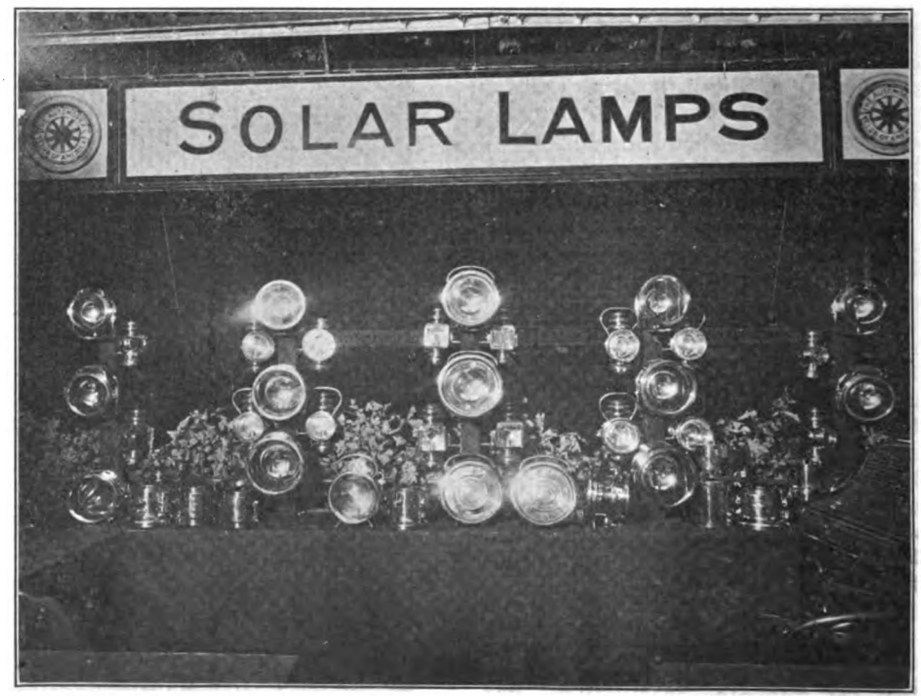
Not at all times is the chauffeur given his choice of how he will come home if he happens to have a blowout or a puncture. The Presto detachable rim was designed with this idea in mind. It permits of the use of

Digitized by Google

any style or make of tire the driver may have with him, or is able to buy or borrow; he is restricted only in size, but not in small diameter, and when a tire cannot be found, he can remove the attachments from the rim and come home on a wide steel flat tire not unlike those found on heavy horse drawn commercial vehicles. By an ingenious shaping of both sides of removable flanges, to be held in place by clips adjustable to varying widths this invention of L. H. Broome permits the immediate fitting of a Dunlop, a clincher, or any detachable, removable rim or any other type of tire to the wheel with no other tools than a small monkey wrench, and any wheel is made ready for the Presto detachable rim by simply turning down the felloe 3-16 of an inch.

Pertaining to Parts and Accessories

Ignition Apparatus.

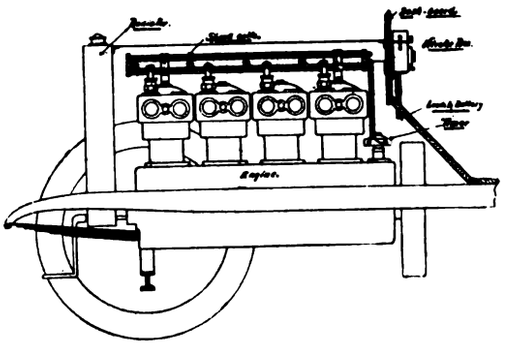


Three types of magnetos were shown at the stand of the Splitdorf Laboratory, New York City. The trio included a low tension, a high tension and a low tension with coil to give high tension current. With the latter system a single coil is used and the high tension current induced in it is distributed to the various plug leads through a distributor mounted on the magneto. The latter thus performs the double function of supplying a primary circuit to the coil and of distributing the secondary circuit from the coil to the different plugs. In connection with the system the coil box is equipped with a switch by which magneto or batteries may be used. That part of the coil equipment which is used in connection with the batteries has a vibrator but the coil which takes its primary current from the magneto is non-vibrating. The balance of the exhibit included samples from the very complete Splitdorf line of timers, coils, distributors, plugs, plug switches and the like.

Refinements in ignition equipment characterized the exhibit of the Connecticut Telephone & Electric Co., of Meriden, Conn. The coil offered by the company for 1908 is fitted with a "kick-switch" having a large, substantial knob which will not break off when hit a drive from one side to the other with the foot. When thrown to the side marked "battery," it closes the battery circuit to the coil, making it subject only to the interruptions of the timer, and at the same time short circuits the magneto circuit. When the cut-out plug is withdrawn, it opens the battery circuit and closes the magneto circuit so that any one tampering with the car would find it impossible to start the motor on either the battery or the magneto. The phenomenon of getting a steady light from a circuit having a vibrator was shown to be possible by the inspection lamp which the exhibitors supply equipped with a plug which may be inserted in the coil front. This is a neat little lamp with a handle and a generous length of cord, and when plugged into the primary battery circuit of the coil it shines steadily and brightly despite the vibrator, because the resistance it offers to the current flow is sufficient to make the vibrator inoperative. A new timer and a new distributor were shown. The distributor is constructed so that there is no back or forward movement of the secondary wire connections when the timing lever is moved to advance or retard the ignition. While a roller contact is used in the timer shown, a rather clever construction marks it from the ordinary run. Instead of having a flat face or rolling surface, the roller has a double bevel while the stationary contacts are like a double track with a slot between, into which the bevel is forced. The two sides of the contacts are of different height, so that the bevel cannot roll without some degree of slippage on one or both of them. The effect of this construction is to avoid having the contact faces of the roller touch the fiber insulation from which they might acquire a glaze, and the sliding on the contacts makes both the latter and the roller bevels bright and clean. A full complement of volt and ammeters and ignition supplies were also displayed.

As one of the pioneer magneto manufacturers, the Remy Electric Co., of Anderson, Ind., has each year shown something new in this form of ignition, and this year it presented a new model high tension, alternating current magneto, known as the Model F, which for simplicity of operation appeared to great advantage. The systems offered provide either for a distributor on the magneto or the running of two plugs in series at a time on a four cylinder motor. No coil is used in connection with the magneto, the secondary winding being on the armature, so that the whole outfit makes a very neat and compact ignition equipment.

Movement, and lots of it, attracted the visitor to the space of the Witherbee Igniter Co., New York City. The hive of live honey bees which stood in the middle of the space as a reminder of "with-a-bee" drew various expressions of alarm or interest from those who gazed at it. Everything on the counters that was capable of buzzing, sparking or flashing light was in circuit with one of the new loose-ring timers, and the winking of the electric lights and the hum of the coils together with the sharp crack of the jumping high tension in the spark plugs had both a fascinating and a confusing effect on the average visitor. In addition to the well known Witherbee batteries of previous years, the company exhibited its line of new "Wico" specialties, including coils with white porcelain tops, timers and distributors of novel design, and spark plugs and minor accessories, such as an electric cigar lighter, recommended for lighting one's cigar or cigarette while traveling 60 miles an hour, an incidental evidence of the rapid age we are living in.



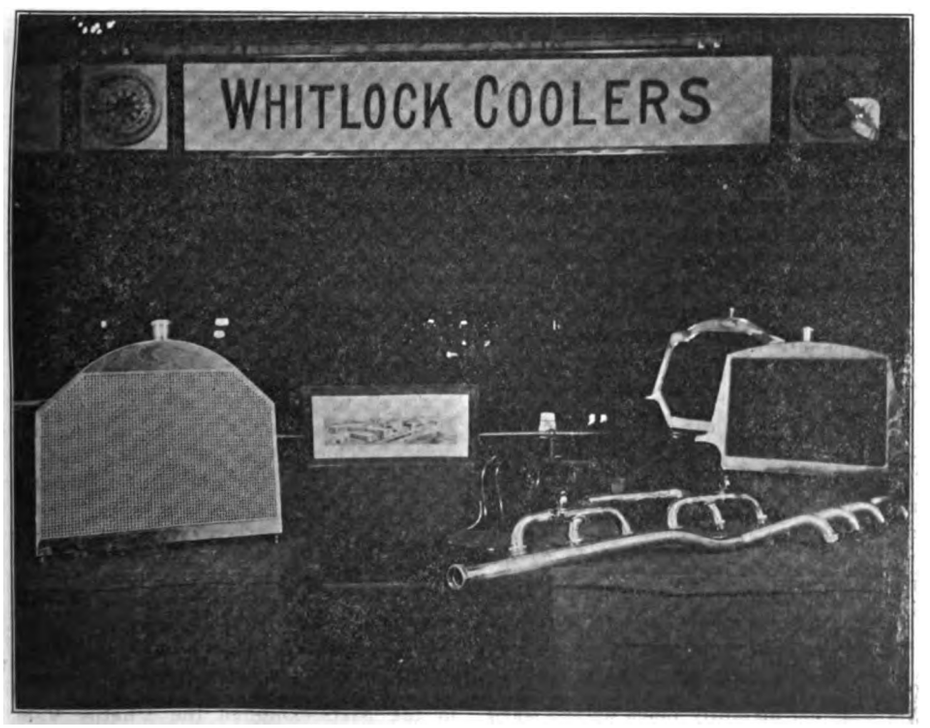
Two complicated but delicate looking instruments supplementing the usual display of coils, magnetos and sparking plugs at the exhibit of the Heinze Electric Co., of Lowell, Mass., attracted the attention of both the idle curious and the seeker after ignition information. Investigation developed that the instruments were not them-

Digitized by Google

selves designed for motor car use, but were used for testing the materials and the performance of Heinze coils, one of the devices being used for determining the magnetizing qualities of the soft iron used in the coil cores, and the other for indicating the voltages of the secondary currents, which in Heinze coils run very high. The magneto ignition system put out by the company this year provides for a single unit coil with a distributor mounted on the magneto. The regular line of coils and switches was shown, with refinements in detail over previous models.

Quite out of the ordinary, both in design and arrangement, the new synchronized ignition system of the Western Electric Co., of New York and Chicago, was the subject of careful study by both professional and amateur investigators interested in ignition problems. The chief visible characteristic of the outfit shown is a long cylindrical coil box placed alongside the cylinder heads of the engine, from which only short leads of high tension cables are necessary to convey the current to the plugs. This coil box, which is but little larger in appearance than the insulating tube sometimes used along the side of the engine to convey the secondary wiring, contains a separate coil unit for each cylinder. The coils themselves are not fitted with vibrators, but a single vibrator on the dash serves them all so that they deliver the spark of a vibrating coil. The primary current goes through the dash vibrator to a distributor, which directs it to each coil unit in turn. It will be seen that this arrangement gives nothing but low tension wiring from the batteries to the dash vibrator and from there to the coil tube along the top of the engine, so that the secondary wiring is simply the short leads from the coil tube to the plugs. This does away with the possibilities of high tension current leaks and short circuits to the frame that are incurred in long secondary current wiring. By reason of the fact that the demands made on the single vibrator are multiplied by the number of cylinders in the engine, provision is made to prevent the platinum points pitting from the flow of current in one constant direction. This is accomplished by equipping the vibrator with a switch which, when turned on before

Western Electric Coil Disposal.



starting the engine, reverses the poles from what they were on the last previous running of the motor. This change of polarity each time keeps both platinum points of the vibrator restored of any losses. While either or both of the two sets of batteries may be used, the pole changing switch has to be used in stopping and starting the engine so that its operation cannot fail through thoughtlessness or neglect. Great economy of current consumption is claimed for the system, the figures of a recent experiment being given as a current consumption of only .3 amperes for a six cylinder engine, with a primary current supplied by four dry cells.

Incandescent lamps of a whiteness and brilliancy not ordinarily met with testified to the power of Apple ignition and lighing current at the exhibit of the Dayton Electrical Mfg. Co. The system of "floating the battery on the line," which the company originated, was made clear to the inquirer. It consists of a small dynamo or generator actuated by the car engine, the current from which passes through an accumulator, in the circuit to the coil. When the car engine is not running, the accumulator may be called upon to give up some of the current which it has figuratively taken as toll when the dynamo was in operation. Thus while the engine is running the current is supplied by the dynamo, and when the engine is stopped the accumulator is available for lighting or for starting on the spark. The regular line of ignition supplies made the balance of the exhibit.

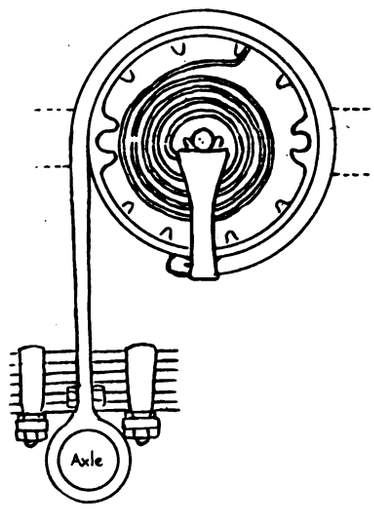
The great length of the sparks emanating from a modest little coil at the booth of the Kokomo Electric Co., of Kokomo, Ind., created the suspicion on the part of observers that the primary current for the coil was supplied by a large dynamo and that the coil was near the limit of burning up or rupturing. The demonstrator, however, was at all times willing to convince the skeptical that the current came from only an ordinary ignition accumulator and that the length of the spark was entirely normal for the coil. Ignition specialties of the familiar types also were shown.

A handsomely finished low tension magneto, comprising a self contained circuit breaker and selector, doing away with distribution and timer is one of the exhibits of the K-W Ignition Co., of Cleveland, O. In equipping a car with this magneto there is used in conjunction with it a two unit non-vibrating coil for the four cylinder types of engine, the coil being so arranged that a spark occurs simultaneously in the exhausted cylinder and in the compression. For cars equipped with vibrating coils this company is putting out the K-W Master Vibrator to correct the synchronism of the engine by causing each cylinder to fire its charge in exactly the same angular position

Since spark plugs first were employed, porcelain and mica have had the field to themselves, almost without challenge from other insulators. This year, however, glass appears in the exhibit of the Anderson Glass Spark plug. It constitutes a combination of pyro-elastic glass welded to steel. As an insulator of electricity glass has always been recognized as most perfect, and together with the fact that it is non-absorbent it suggests infinite possibilities. In the Anderson invention a large, strong shell of steel has the usual metal core which is surrounded by the glass forced in while molten and welded to the metal so that the finished plug is actually one piece, with neither gaskets or washers necessary to make it tight. The cylinder explosions can

Digitized by Google

be seen through the top of the plug, thus providing occular means for regulating the explosive mixture.



Since the earliest days of the jump spark there has been almost no change in the principle of the spark plug; it is true that refinements have occurred from time to time, resulting in the neat compact plug in general use to-day, where earlier designs were cumbersome, and in their finish crude; yet the very earliest designs contained the two stationary points or a construction varying but little from this, and then as now the inventor's chief claim was of the case with which the sparking surfaces could be cleaned and the unlikelihood of the plug fouling or short circuiting. At the show this year is exhibited a "vibrating" plug, the product of the Triumph Engineering Co. of New York, which marks a departure from the accepted standard. The plug consists of three parts, the sectional shell or base, the bushing and the core; the core is of the usual form employed in the mica plugs, mica discs compressed around a metal center, but has a valve seating around it, which fits into the bushing and works like a piston in the shell, as the compression and exhaust stroke of a four cycle engine and each upward stroke of the two cycle force the plug core or armature, as it may well be called, up into the valve seat that is constructed in the bushing. The continued rapid movement of the core is designed to prevent the carbon or oil deposits which usually cause short circuiting; the poppet valve construction prevents loss of compression, and yet the cylinders may be primed through the plug without loosening the latter or in any way affecting its position.

Compact transformers and rectifiers were shown by the E. & M. Development Co., of Asbury Park, N. J., suitable for converting alternating lighting current into direct for ignition battery charging, and a variety of accumulators and dry cells were shown by other exhibitors, including storage batteries of large capacity and very low price by Geiszler Brothers, of New York.

Shock Absorbing Devices.

While the term "shock absorber" should in a strict sense, be used only with a careful regard for the propriety rights of its originators, the makers of the Truffault-Hartford, yet it is such a useful descriptive term that it is now generally accepted as embracing many devices of the same general class, even including special spring suspensions. The field was well represented at the show. The Hartford Suspension Co., New York, put on view the 1908 Truffault-Hartford shock absorbers, equipped with indicator dials by means of which the proper friction tension for any car may be arrived at without the necessity for experiment. The new styles also have a construction which makes it impossible for slush or grit to get to the friction surfaces. The Hotchkin anti-jolt device, made by the Hotchkin Mfg.. Co., of Chicago, was mounted on a display stand illustrative of the many styles of lugs and fittings with which it can now be supplied, to facilitate application. The latest Diezemann, with universal joints at the ends of the arms where they attached to frame and axle, respectively, was to be seen at the space of the Diezemann Shock Absorber Co., of Hoboken, N. J. A pneumatic brass cylinder shock absorber was numbered among the specialties of the Turner Brass Works, of Sycamore, Ill., and the Gabriel Horn Mfg. Co., of Cleveland, exhibited its friction shock absorber.

A whole car was used to demonstrate the workings of the Stolp shock absorber. The system requires the moving of the rear axle back several inches to the rear ends of two

F. R. V. Friction Recoil Check.

long side bars underneath the frame. The points of support for the rear of the body are then placed on a rocker arrangement on the side bars, and the front ends of the side bars are supported by a vertical shackle dropped from each side of the frame. Opposed spiral springs in the shackle keep the side bar ends normally at mid point, but when a bump is struck the rear axle of the car goes up and the front end of the side bars go down, while the rocker which supports the rear springs of the cars is just at the fulcrum point, and little shock is conveyed to the passengers. Sager spiral springs for correcting and easing of spring action were shown by the J. H. Sager Co., of Rochester, N. Y., at a nearby stand.

An inexpensive shock absorber is among the exhibits of the F. R. V. Auto Parts Co., which they maintain automatically prevents the rebound of motor car springs when riding over rough roads.

The absorber consists of five parts, the drum, belt, arm, coil spring, and cover. The axle of the drum is fastened to the frame or upper spring support; the belt passes over and partially around the drum, one ending fastened to the car axle. When the car strikes an obstruction or rut and the car springs contract, the coil spring in the absorber drum to which the free end of the belt is attached instantly takes up the slack in the brake belt preventing violent recoil of the springs which constitutes the shock.

Unless a very close inspection is made of the Reliance Spark Plug the investigator wonders by what process porcelain has been converted to a conductor of electricity for no sparking point is easily visible in the core of the plug manufactured by the Jeffery-De Witt Co., Newark, N. J., but with a magnifying glass there may be seen a minute platinum wire which comes flush with the core in its center and from which the spark jumps. Working on the theory that a spark leaving such a minute point will be concentrated and intensified the inventor baked in porcelain a platinum wire seven-thousands of an inch in diameter and found in his tests that the heat and scouring action of the spark against the surface of the insulator with which it was flush instantly destroyed any short circuiting substances which may have collected around and over the point, in fact, the exposed surface was too small to gather an accumulation which would not be immediately pierced by the spark. This is the main and prominent feature of the Reliance plug which is otherwise of the same appearance as the generally accepted designs. In the Palace exhibit the plugs are being demonstrated with the points under water where apparently unaffected, they are a source of wonder to those whose experience on the road or in an open boat, in the rain, has taught them the short circuiting tendencies of water.

The Acme Spring Check Co. demontsrated a new recoil check styled "The Shocsorber," consisting of a simple arrangement of four small rollers placed in tapered openings equidistant around the edge of a drum. The arms or levers are attached to this drum and move with entire freedom when the opposite ends, which are fastened respectively to the frame and axle, are closing as the body is sinking toward the axles. When the springs are depressed to the maximum of the shock and attempt to regain their normal position by throwing the car body violently upward, the rollers are directed into narrow portions of the tapered openings by small springs and exert a friction on the ring which is not released until the body is aga'n in its usual position to the axles.

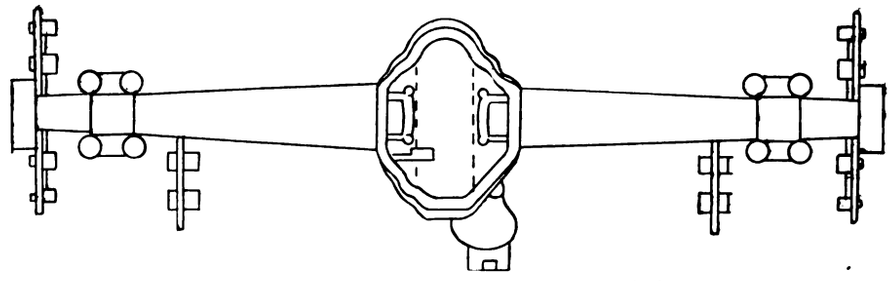
Speed Indicating Instruments.

The group of speed indicator exhibitors were all to be complimented on the displays they made of their respective instruments. The Jones Speedometer, of New York, and Stewart & Clark, of Chicago, revealed new instruments at low prices in addition to their regular lines or higher priced indicators, but the Warner Instrument Co., of Beloit, Wis., offered only its standard Auto-meter, with a clock and electric light attachment as available extras. W. S. Jones, of Philadelphia, in addition to showing the indicator which he has handled in the past, exhibited the Phelps Vehicle

Digitized by Google

recorder, a device which may be locked on a car or vehicle and which, without any driving connections with either wheels or motor, will register the periods of travel. It consists essentially of a clock mechanism rotating a disc on which a paper record for a whole week may be placed. A small oscillating pendulum inside the case makes the recording pen give an irregular jagged line when the vehicle is moving, leaving a smooth line tracing while the vehicle is standing still. The periods of travel or rest are thus graphically recorded, the vibration of the vehicle on street or road being sufficient to affect the pendulum in the instrument. Refinements in detail were observable in the Springfield Motometer, made by the R. H. Smith Co., of Springfield, Mass., the Index, made by the Index Speed Indicator Co., formerly the Oliver Instrument Co., of Minneapolis, Minn., and the Loring, of New York.

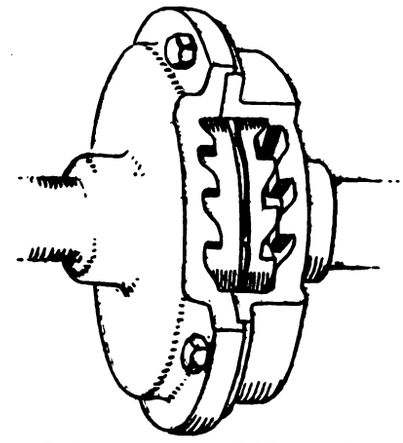
It would be interesting to know how much commission the Model Mfg. Co. will have to pay to a chauffeur to sell him a Timograph for the "boss's" car. This simple machine, about 5 inches high and four in diameter, may be attached to any part of the car and if wound once a week will present an absolute record of every movement of the car, recording even the short stops required by the traffic regulations. Unless one possesses the key the Timograph cannot be removed from the car nor can the record be altered. The plan is not unlike the dial of a watchman's clock and is not apt to meet with favor with the "joy riding" chauffeur, who cannot easily explain the midnight record when the owner was home asleep.



Acetylene and Oil Lamps.

Really new things in lamps were disclosed at the stand of the Badger Brass Mfg. Co., of Kenosha, Wis., and New York City. The first exhibited sample of a Solar lamp equipped with the Besnard system of light refraction and projection and fitted with an eclipsing shutter for diminishing the dazzling glare at will, was shown. The chief features of the lamp apparent to the eye are that instead of a bull's-eye lens supported by a bracket in front of the flame or cemented to the center of the front glass, the whole front glass is itself a condensing lens, while back of the flame there is a hyperbolic reflector. The dimming mechanism is simply a little arm with a round black disc on it, which can be swung down back of the flame to intercept the rays which ordinarily focus from the reflector to the lens. The arm is actuated from the driver's seat by means of a small handle with a flexible cable lead to the lamp or lamps. The standard Solar lens mirror headlights and the fancy side lights and tail lights were displayed, but these were supplemented by oil lights finished in a manner unique in lamp making. The finish is a plain black which the uninitiated might easily mistake by its appearance for common japanning. It is a secret process finish heretofore used almost exclusively on government range finders and similar instruments and never before applied to automobile lamps. Its virtues are that mud cannot spoil it, dents cannot crack it, it retains its lustre through all kinds of hard knocks and that it is rich in general outdoor wearing qualities.

Other lamp exhibitors also presented lamps in black nickel or gun metal finishes, but in the main their exhibits were chiefly detail changes in previous models.



Parts for the Builder.

To the layman, ignorant of mechanical matters or automobile construction, there was little to attract the eye in the exhibit of the Wm. Cramp & Sons Ship & Engine Building Co., of Philadelphia, in whose space were a lot of castings of odd sizes and shapes. But the experts who wandered that way were arrested by the sight of a complete rear axle differential housing and axle tubes, all cast in one piece, with spring saddles and brake mechanism supports all on. The casting was of Parsons manganese bronze and was in many respects a wonderful piece of work. By virtue of doing away with the necessity for a great deal of riveting and brazing, the casting is said to offer great economy and more than usual strength. Front axle castings of the same material for various famous car makers were also shown, together with bushings for bearings, made of Parsons white brass.

Cramp One-Piece Casting for Rear Axle.

While at previous shows the American

F. R. V. Gearless Differential.

& British Manufacturing Co., of Bridgeport, Conn., has exhibited automobile parts of its own manufacture, at the Palace show it disclosed motors of the kind it is now making under contract. The famous Herreshoff motor, rated at 40 horsepower, was displayed with sections cut away to show the valve action and the arrangement of the interior. The horsepower test figures given in connection with the total weight of the motor indicate that it is above the average in performance, and it is given as a part explanation of the inventor's success in getting such results that as a marine architect he generated many curves and sweeps that are known only to the ship designer.

Great display racks of heavy axles equipped with Timken roller bearing hubs formed the big feature of the exhibit of the Timken Roller Bearing Axle Co., of Canton, O. The form of axle with roller bearings in the steering knuckle head received considerable attention from engineers and designers visiting the show, and the newest application of the Hedgeland rear axle was also given critical examination. Large hubs, some 3 inches or more, were shown as 1908 additions to the company's range of offerings to the manufacturer who wishes to buy his axle and hub parts.

The F. R. V. gearless differential, which permits the faster wheel to override the slower one by means of a ratchet arrangement, was shown taken apart and also assembled on a complete rear axle with automobile wheels. The demonstrations took in back and forward tests, and the simple mechanism, with only five parts, apparently did everything required of such a device. The ratchets which might be expected to prevent driving the car backward, automatically meet the condition by jamming together and making the ratchet effect disappear. The essence of the construction is that only one side of the ratchet arrangement can act at a time.

As beauty lies in the eye of the beholder, the exhibit of the Light Mfg. & Foundry Co., of Pottstown, Pa., was beautiful or not, according to the observer's knowledge of fine castings. To the technical eye the specimens of work done by the company in aluminum alloy castings of crank cases, covers and the like, were of extreme interest, and the automobile in miniature, made of the same sort of castings caught the attention of many who were necessarily ignorant of the value of the rest of the exhibit.

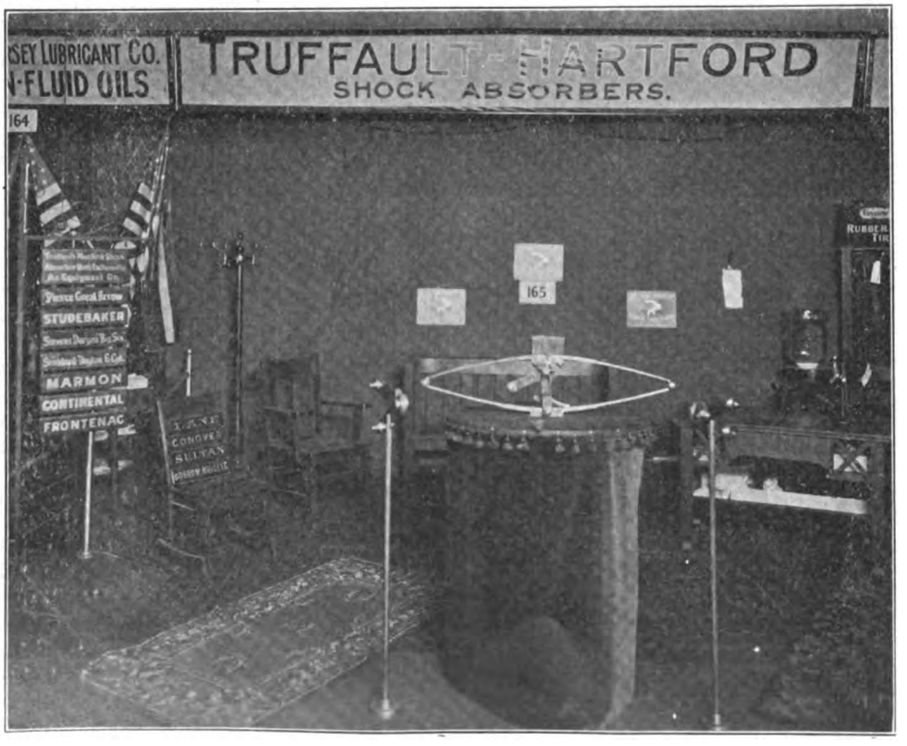
Whitlock radiators in an imposing array of styles bore evidence to the Whitlock Coil Pipe Co.'s peculiar capabilities for this sort of work. Specimens of pipe bending and manifold work were also shown to demonstrate the specialized manufacture for which the big Hartford plant is well fitted. Some of the radiators exhibited were of the styles made for prominent cars, suggesting the approval with which the automobile manufacturers regard them.

Such improvements as have been incorporated in the manufacture of Whitney chains cannot be indicated by mere external appearance, so that the big rack of chains in the space of the Whitney Mfg. Co., of Hartford, Conn., looked much the same as in previous years, showing the usual variety and testifying to the increasing demand for the company's products. Display boards of the keying system which the Whitney Co. fathers were likewise shown.



A rear axle differential housing and axle tubes drawn from sheet steel was a new offering of the American Ball Bearing Co., of Cleveland, O., in connection with the regular line of bearings and axles. In fact the drawn steel housing is so new that delivery dates on it are placed in the future instead of the immediate present.

Hoods, fenders and radiators in profusion were observable in the Briscoe Mfg. Co.'s space as off-hand specimens of the kind of work done at the factory in Detroit. Seemingly no attempt was made to show all the great variety of styles in which Briscoe radiators are made or all the classes of work that the concern is capable of doing.

In the center of the space of the Kinsey Mfg. Co., of Dayton, O., a chassis frame bore a hood of the company's manufacture, together with a radiator, fenders and other parts of which it makes a specialty. The display was designed to suggest the preparedness of the concern in supplying the automobile manufacturer with parts which he would find no advantage in making at his own plant.

Chains with the imprint of the Diamond Chain and Mfg. Co., of Indianapolis, on the links were exhibited in simple display on a table. Spectacular methods of exploiting such a well known product are naturally hardly worth while, since it is by reputation and performance that chains are judged. The built-up chain having hardened steel bushings with large rivets, and the latest chrome steel chains were shown as leaders. The company also exhibited its axles and steering connections.

At the Baldwin Chain & Mfg. Co.'s space both chains and sprockets were shown. The Baldwin chain with detachable links was, of course, featured, and the presence of the sprockets asserted the Worcester company's competency to supply full chain drive equipment.

An electric motor taking the place of the regular motor, just for the purposes of the show, a very good demonstration of its rear axle and differential was given by the Standard Roller Bearing Co., of Philadelphia. Incandescent lights concealed in the housing made it possible to view the mechanism through glass covers substituted for the regular cover plates. Axles, parts and ball bearings were the products shown.

Columbia locknuts in two general styles and a variety of sizes were exhibited by the Columbia Nut & Bolt Co., of Bridgeport, Conn. Split sections of the nuts on threaded bolts made clear the method of obtaining the locking effect.

Quite a show in itself, the space of Chas. E. Miller, the famous New York jobber, whose stores are dotted over the continent, contained such a variety of automobile goods as to impress even the most casual visitor with the immensity of his main stock. Most of the goods in the Miller space at the show, however, were but samples of full lines of clothing, goggles, jewelry, novelties and accessories, and did not give representation to his stock of parts and supplies. However, the celebrated Brampton chains were shown in many sizes, together with an old Brampton chain that has seen an unconscienable mileage. The Miller speed indicator was attractively displayed on a stand with a variable speed drive so that the steady action of the hand might be observed. Copies of the big Miller catalog were handed to visitors, supply-

Digitized by Google

ing them with a book of reference on supplies and accessories.

Improved types of the transmissions, differentials and steering gears of the Brown-Lipe Gear Co., of Syracuse, N. Y., were shown in that company's space. The selective transmissions had their lids off so that the public might see the compact arrangement of the gears and try the feel of the change gear lever.

Each year the users of gasolene engines find a new indicator gauge presented for their approval and at the Palace show a very clever and simple invention is shown by the Webster Mfg. Co. A brass tube, partially slotted on one side for the free movement of the rod to which a ball float is attached, contains a pair of gears, the rise and fall of float changes their relative positions, the change being depicted on a silvered steel face, calibrated to inches, where a hand indicator under glass presents an always ready true indication of the quantity of gasolene in the tank.

Among the smaller specialties an electric gasolene gauge made by the Auto Pump Co., of Springville, N. Y., attracted considerable attention. The face of the gauge was in divisions, and upon pressing a push button a bright electric light would shine behind the division answering to the fuel level, indicating whether the tank were half full, three-quarters full, etc. The device is so constructed that upon the fuel level getting close to the bottom the alarm light of "Empty" starts of itself without pushing the button. The float in the tank has roller contacts on two sides of a vulcanized rod running to the tank bottom. On one side the insulating rod has individual contacts for each light in the gauge and on the other it has one common electrical return, so as the float goes up and down it makes the contacts for the different lights.

A wealth of minor accessories of one sort or another were shown at different spaces. Tire jackets and inner tube bags were noticeable, leading to the belief that drivers are growing to understand their value in saving tire money. The Gilbert Mfg. Co., of New Haven, had a very complete line of them, including some in gay colors to match special car bodies. The company's display also included leather protectors for various parts of the car, such as steering knuckles and universal joints, together with slip covers, and rain aprons for both cars and drivers.

The full list of exhibitors and the goods they displayed is as follows:

Automobiles.

American Motor Car Co., Indianapolis, Ind.
American Gasolene Cars.
One 4-cylinder chassis and one 4-cylinder roadster.

Atlas Motor Car Co., Springfield, Mass.
Atlas Gasolene Cars.
One 3-cylinder roadster, one 2-cylinder runabout, and one 4-cylinder touring car.

Acme Motor Car Co., Reading, Pa.
Acme Gasolene Cars.
One 6-cylinder touring car, and one 4-cylinder touring car.

Allen-Kingston Motor Car Co., Kingston, N. Y.
A-K Gasolene Cars.
One 4-cylinder touring car and one 4-cylinder roadster.

Anderson Carriage Co., Detroit, Mich.
Anderson Electric Cars.
One electric coupe and one electric Victoria.

Austin Auto Co., Grand Rapids, Mich.
Austin Gasolene Cars.
One 6-cylinder touring car, one 6-cylinder limousine and one 6-cylinder roadster.

Abendroth & Root Mfg. Co., Newburgh, N. Y.
Frontenac Gasolene Cars.
One 4-cylinder touring car, one 4-cylinder roadster, and one 4-cylinder limousine.

Bartholomew Co., Peoria, Ill.
Glide Gasolene Cars.
Two 4-cylinder touring cars, one 4-cylinder limousine, and one 4-cylinder model engine.

Digitized by Google

Buckeye Mfg. Co., Anderson, Ind.
Lambert Gasolene Cars.
One 2-cylinder roadster, one 4-cylinder chassis, and two 4-cylinder touring cars.

Brush Runabout Co., Detroit, Mich.
Brush Gasolene Cars.
One 2-cylinder runabout, one 1-cylinder delivery wagon, and one 1-cylinder runabout.

Crawford Auto Co., Hagerstown, Md.
Crawford Gasolene Cars.
One 4-cylinder chassis, one 4-cylinder landaulet, and one 4-cylinder touring car.

Cameron Car Co., Brockton, Mass.
Cameron Gasolene Cars.
One 4-cylinder runabout and one 4-cylinder roadster—both air cooled.

Carter Motor Car Corp'n, Washington, D.C.
Carter Gasolene Cars.
Two 8-cylinder air-cooled touring cars.

Cleveland Motor Car Co., Cleveland, Ohio.
Cleveland Gasolene Cars.
One 4-cylinder chassis, one 4-cylinder limousine, one 4-cylinder roadster, and one 4-cylinder touring car.

Continental Automobile Mfg. Co., New Haven, Conn.
Continental Gasolene Cars.
One 4-cylinder touring car, one 4-cylinder roadster, and one 4-cylinder Victoria.

Colt Runabout Co., New York City.
Colt Gasolene Cars.
One 6-cylinder chassis and one 6-cylinder racing runabout.

Chadwick Engineering Works, Phila., Pa.
Chadwick Great Six Gasolene Cars.
One 6-cylinder chassis, one 6-cylinder roadster, and one 6-cylinder touring car.

Dayton Motor Car Co., Dayton, Ohio.
Stoddard-Dayton Gasolene Cars.
One 4-cylinder chassis, one 6-cylinder chassis, two 4-cylinder roadsters, one 4-cylinder touring car, one 6-cylinder touring car, one 4-cylinder limousine, one 4-cylinder taxicab, and one 4 cylinder doctor's carriage.

Dragon Auto Co., Philadelphia, Pa.
Dragon Gasolene Cars.
One 4-cylinder roadster, one 4-cylinder touring car, and one 4 cylinder model engine.

De Luxe Motor Car Co., Detroit, Mich.
De Luxe Gasolene Cars.
One 4-cylinder chassis and two 4-cylinder touring cars.

Dorris Motor Car Co., St. Louis, Mo.
Dorris Gasolene Cars.
One 4-cylinder chassis, one 4-cylinder touring car, one 4-cylinder limousine, and one 4-cylinder roadster.

Eagle Motor Co., Middletown, Conn.
Compound Gasolene Cars.
One 3-cylinder chassis, one 3-cylinder runabout, and one 3-cylinder touring car.

J. M. Ellsworth, New York City.
Ellsworth Gasolene Cars.
One 4-cylinder chassis and one brougham body.

Ford Motor Co., Detroit, Mich.
Ford Gasolene Cars.
Two 4 cylinder runabouts, one 6-cylinder roadster, and one 6 cylinder touring car.

Grout Bros. Automobile Co., Orange, Mass.
Grout Gasolene Cars.
One 4-cylinder chassis and one 4-cylinder touring car.

Gearless Transmission Co., Rochester, N. Y.
Gearless Gasolene Cars.
One 6-cylinder roadster, one 6-cylinder chassis, one 4-cylinder touring car, one 6-cylinder touring car, and one 6-cylinder model engine.

Gaeth Auto Works, Cleveland, Ohio.
Gaeth Gasolene Cars.
One 4-cylinder chassis and one 4-cylinder touring car.

Garford Motor Car Co., New York City.
Garford Gasolene Cars.
One 4-cylinder chassis, five 4-cylinder limousines, one 4-cylinder roadster and one 4-cylinder touring car.

Hatfield Motor Veh. Co., Miamisburg, Ohio.
Hatfield Gasolene Cars.
One 2-cylinder high wheeled "buggy-about" and one 2-cylinder chassis—both air cooled.

Holsman Auto Co., Chicago, Ill.
Holsman Gasolene Cars.
One 2-cylinder high wheeled buggy runabout and one 2-cylinder high wheeled surrey—all air cooled.

Imperial Motor Car Co., Williamsport, Pa.
Second Imperial Gasolene Cars.
One 4-cylinder chassis and two 4-cylinder roadsters.

Jackson Automobile Co., Jackson, Mich.
Jackson Gasolene Cars.
One 4-cylinder chassis, one 4-cylinder roadster and two 2-cylinder touring cars.

W. H. Kiblinger Co., Auburn, Ind.
Kiblinger Gasolene Cars.
One 2-cylinder chassis, one 2-cylinder high wheeled buggy, and one 2-cylinder model engine—all air cooled.

Klink Motor Car Mfg. Co., Dansville, N. Y.
Klink Gasolene Cars.
One 4-cylinder roadster and one 4-cylinder touring car.

Kissell Motor Car Co., Hartford, Wis.
Kissellkar Gasolene Cars.
One 4-cylinder chassis, one 4-cylinder limousine and one 4-cylinder touring car.

Lane Motor Veh. Co., Poughkeepsie, N. Y.
Lane Steam Cars.
Two steam roadsters and one steam touring car.

Logan Construction Co., Chilicothe, Ohio.
Logan Gasolene Cars.
One 4-cylinder air-cooled chassis, one 4-cylinder air-cooled delivery wagon, and one 4-cylinder water-cooled chassis.

The Lansden Co., Newark, N. J.
Lansden Electric Cars.
Two delivery wagons and one touring car.

Oscar Lear Auto Co., Springfield, Ohio.
Frayer-Miller Gasolene Cars.
One 4-cylinder roadster, two 4-cylinder touring cars, and one 4-cylinder racing runabout—all air cooled.

Rapid Motor Vehicle Co., Pontiac, Mich.
Rapid Gasolene Cars.
One 2-cylinder chassis, one 2-cylinder police patrol, one 2-cylinder 1½-ton truck, one 2-cylinder 16-passenger wagonette, one 2-cylinder 12-passenger sight seeing car, one 2-cylinder 12-passenger bus, one 2-cylinder 1-ton delivery wagon, one 2-cylinder 20 passenger sight seeing car, and one 2-cylinder 12-passenger opera bus.

Maxwell-Briscoe Motor Co., Tarrytown, N. Y.
Maxwell Gasolene Cars.
Two 4-cylinder touring cars, one 4-cylinder limousine, one 4-cylinder roadster, one 4-cylinder chassis, one 2-cylinder chassis, one 2-cylinder touring car, and one 2-cylinder runabout.

Mitchell Motor Car Co., Racine, Wis.
Mitchell Gasolene Cars.
One 4-cylinder runabout, one 4-cylinder limousine, one 4-cylinder roadster and one 4-cylinder touring car.

Mora Motor Car Co., Newark, N. Y.
Mora Gasolene Cars.
Two 4-cylinder roadsters, one 4-cylinder touring car, one 6-cylinder chassis, one 6-cylinder roadster, and one 6-cylinder touring car.

Motor Car Co., Detroit, Mich.
Cartercar Gasolene Cars.
One 2-cylinder chassis and two 2-cylinder touring cars.

Mack Bros. Motor Car Co., Allentown, Pa.
Mack Gasolene Cars.
One 4-cylinder 22-passenger sight seeing car and one 4-cylinder 3-ton truck.

Moon Motor Car Co., St. Louis, Mo.
Moon Gasolene Cars.
One 4-cylinder chassis, two 4-cylinder touring cars, and one 4-cylinder roadster.

Moline Automobile Co., East Moline, Ill.
Moline Gasolene Cars.
One 4-cylinder touring car and one 2-cylinder touring car.

Marion Motor Car Co., Indianapolis, Ind.
Marion Flyer Gasolene Cars.
One 6-cylinder roadster, and two 4-cylinder roadsters.

Nordyke & Marmon Co., Indianapolis, Ind.
Marmon Gasolene Cars.
One 4-cylinder air-cooled chassis, one 4-cylinder air-cooled touring car, one 4-cylinder water-cooled roadster, and one 4-cylinder water-cooled touring car.

National Motor Vehicle Co., Indianapolis, Ind.
National Gasolene Cars.
One 4-cylinder roadster, one 6-cylinder limousine, two 6-cylinder touring cars, one 4-cylinder touring car and one 4-cylinder model engine.

Napier Motor Co. of Amer. Boston, Mass.
American Napier Gasolene Cars.
One 6-cylinder limousine and one 4-cylinder runabout.

Overland Auto Co., Indianapolis, Ind.
Overland Gasolene Cars.
One 4-cylinder chassis and one 4-cylinder roadster.

Pontiac Spring and Wagon Works, Pontiac, Mich.
Pontiac Gasolene Buggy.
One 2-cylinder high wheeled buggy runabout.

Pennsylvania Auto-Motor Co., Bryn Mawr, Pa.
Pennsylvania Gasolene Cars.
One 4-cylinder chassis, one 4-cylinder touring car, and one 4-cylinder roadster.

Premier Motor Mfg. Co., Indianapolis, Ind.
Premier Gasolene Cars.
Two 4-cylinder touring cars one 4-cylinder roadster, and one 6-cylinder touring car.

J. N. Quinby & Co., Newark, N. J.
Bodies.
One 4-cylinder Panhard touring car, one 4-cylinder Simplex limousine, and one 4-cylinder Simplex roadster.

Reliance Motor Car Co., Detroit, Mich.
Reliance Gasolene Trucks.
One 3-cylinder chassis, one 4-cylinder 5-ton truck and one 2-cylinder 2-ton truck.

Reliable-Dayton Motor Car Co., Chicago, Ill.
Reliable-Dayton (Buggy type) Gasolene Cars.
One 2-cylinder chassis, one 2-cylinder high wheeled buggy runabout, and one 2-cylinder coupe.

Rainier Motor Car Co., New York City.
Rainier Gasolene Cars.
One 4-cylinder chassis, one 4-cylinder touring car, and one 4-cylinder limousine.

Reo Motor Car Co., Lansing, Mich.
Reo Gasolene Cars.
Two 2-cylinder touring cars, one 2-cylinder roadster, one 2-cylinder chassis and one 1-cylinder runabout.

Smith Auto Co., Topeka, Kan.
Great Smith Gasolene Cars.
One 4-cylinder touring car and one 4-cylinder roadster.

Schact Mfg. Co., Cincinnati, Ohio.
Schact Gasolene Cars.
(Buggy Type.)
Three 2-cylinder high wheeled buggy runabouts.

St. Louis Car Co., St. Louis, Mo.
American Mors Gasolene Cars.
One 6-cylinder chassis, two 4-cylinder limousines and one 6-cylinder touring car.

Wayne Auto Co., Detroit, Mich.
Wayne Gasolene Cars.
Two 4-cylinder touring cars, two 4-cylinder roadsters, and one 4-cylinder chassis.

Welch Motor Car Co., Pontiac, Mich.
Welch Gasolene Cars.
One 6-cylinder limousine and one 4-cylinder touring car.

Wayne Works, Richmond, Ind.
Richmond Gasolene Cars.
Two 4-cylinder air-cooled touring cars.

York Motor Car Co., York, Pa.
York Pullman Gasolene Cars.
One 6-cylinder roadster, two 4-cylinder model engines, two 4-cylinder touring cars.

Aurora Automatic Machine Co., Aurora, Ill., first gallery, 192—Thor motors and components.

Autocoil Co., Jersey City, N. J., first gallery, 187—Coils and ignition specialties.

Auto Accessories Mfg. Co., Detroit, Mich., first gallery, 123—Tops, tire jackets and specialties.

Auto Improvement Co., New York City, first gallery, 138—Self-starters and specialties.

Auto Igniter Co., New York City, second gallery, 369—Igniters.

Auto Pump Co., Springville, N. Y., first gallery, 168—Pumps and specialties.

Autolyte Mfg. Co., New York City, second gallery—Lamps, generators, horns, etc.

Automobile Supply Mfg. Co., Brooklyn, N. Y., second gallery, 347—Horns, tubing and brass specialties.

Auto Spring Repairer Co., New York City, second gallery, 375—Spring repair outfits.

Automobile Utilities Co., Boston, Mass., second gallery, 364.

Badger Brass Mfg. Co., New York City and Kenosha, Wis., first gallery, 111.—Solar lamps and acetylene generators.

Baldwin Chain & Mfg. Co., Worcester, Mass., first gallery, 161—Baldwin chains and recoil check.

S. F. Bowser & Co., Fort Wayne, Ind., first gallery, 126—Gasolene and oil storage outfits.

Breeze Carbureter Co., Newark, N. J., first gallery, 183—Breeze carburetters.

J. S. Bretz Co., New York City, second gallery, 355—Ball bearings and high tension magnetos.

Briscoe Mfg. Co., Detroit, Mich., first gallery, 163—Radiators and fittings.

Brooke Automobile Supply Co., New York City, second gallery, 302—Supplies.

Brown-Lipe Gear Co., Syracuse, N. Y., first gallery, 107—Transmissions, differentials and steering gear.

Brownell-Trebert Co., Rochester, N. Y., second gallery, 316—Motors.

Bureau of Tours, Automobile Club of America, second gallery, 376—Model hotel room for tourists.

Byrne, Kingston & Co., Kokomo, Ind., first gallery, 171—Kingston carburetters.

Clover Mfg. Co., New York City, second gallery, 361—Grinding compound.

Coe's Wrench Co., Worcester Mass., first gallery, 135—Wrenches.

Cohn, Frank & Co., second gallery—Specialties.

Columbia Nut & Bolt Co., Inc., Bridgeport, Conn., first gallery, 169—Columbia lock nuts.

Commonwealth Rubber Co., Reading, Mass., second gallery, 344—Tires.

Comptoir d'Innovations Automobiles, Paris, second gallery, 351—Tire inflators and French specialties.

Connecticut Telephone & Electric Co., Meriden, Conn., first gallery, 195—Spark coils, switches and ignition specialties.

Consolidated Optical Co., New York City, second gallery, 365—Goggles.

Continental Caoutchouc Co., New York City, first gallery, 211—Continental tires.

Cowles & Co., New Haven, Conn., first gallery, 201A—Accessories.

Cramp & Sons Ship & Engine Building Co., Philadelphia, first gallery, 162—Bronze castings and automobile parts.

Crown Battery Co., New York, second gallery, 314—Dry cells.

W. Smalley Daniels, Boston, Mass., second gallery, 317—Jacks and pumps.

Dayton Electrical Mfg. Co., Dayton, O., first gallery, 157—Igniters and ignition specialties.

J. E. Demar, New York City, second gallery, 332—Detachable rims.

Diamond Chain & Mfg. Co., Indianapolis, Ind., first gallery, 191—Diamond chains.

Diamond Rubber Co., Akron, O., first gallery, 104—Diamond tires.

Diezeman Shock Absorber Co., Hoboken, N. J., first gallery, 143—Shock absorbers.

Jos. Dixon Crucible Co., Jersey City, N. J., first gallery, 175—Graphite lubricants.

Dow Portable Electric Co., Braintree, Mass., second gallery—Coils, ignition specialties.

C. J. Downing, New York City, second gallery, 301—Supplies.

W. J. Duane & Co., New York City, first gallery, 141—Tops and slip covers.

Eastern Carbon Works, Jersey City, N. J., first gallery, 177—Batteries.

Edmunds & Jones Mfg. Co., Detroit, Mich., first gallery, 184—Lamps and specialties.

Electric Storage Battery Co., Philadelphia, first gallery, 148—Accumulators.

Electrical and Mechanical Development Co., Asbury Park, N. J., first gallery—Transformers and rectifiers.

Elite Mfg. Co., Ashland, O., second gallery, 306—Jacks and pumps.

Empire Auto Tire Co., Trenton, N. J., first gallery, 127—Empire tires.

F. R. V. Auto Parts Co., New York City, second gallery, 325—Shock absorbers.

Firestone Tire & Rubber Co., New York City, first gallery, 166—Firestone tires.

Fisk Rubber Co., Chicopee Falls, Mass., first gallery, 110—Fisk tires.

Gabriel Horn Mfg. Co., Cleveland, O., first gallery, 198—Gabriel horns.

Geiszler Bros., New York City, second gallery, 312—Batteries.

Gemmer Mfg. Co., Detroit, Mich., first gallery, 193—Steering gears and parts.

Gilbert Mfg. Co., New Haven, Conn., first gallery, 153—Tire jackets, lamps, covers and rubber cloth specialties.

C. P. Goerz Optical Co., Rochester, N. Y., second gallery—Lenses.

B. F. Goodrich Co., New York, first gallery, 112—Tires.

Goodyear Tire & Rubber Co., Akron, O., first gallery, 119—Goodyear tires.

G & J Tire Co., Indianapolis, Ind., first gallery, 108—G & J tires.

Gray & Davis, Amesbury, Mass., first gallery, 103—Lamps.

Gray-Hawley Mfg. Co., Detroit, Mich., first gallery, 190—Chime whistles and cut-out mufflers.

C. T. Ham Mfg. Co., Rochester, N. Y., first gallery, 139—Lamps.

Hancock Mfg. Co., Charlotte, Mich., first gallery, 195A—Oilers, tank gauges and fittings.

A. W. Harris Oil Co., Providence, R. I., first gallery, 149—Lubricants.

Hartford Rubber Works Co., Hartford, Conn., first gallery, 101—Hartford tires.

Hartford Suspension Co., New York, City, first gallery, 165—Hartford-Truffault shock absorbers.

Hayes Mfg. Co., Detroit, Mich., first gallery, 140—Fenders and fittings.

Hartford Auto Parts Co., Hartford, Conn., first gallery, 150—Universal joints and automobile parts.

READY NOW FOR THE GARDEN SHOW

How the Garden Will be Transformed for the Show.

There may be other shows and other show buildings, but it is certain that the one which is housed in Madison Square Garden, New York, by virtue of that fact, starts with a tremendous advantage which not even the most embittered rival can gainsay. Not only is it centrally located and close to "dear old" Broadway, but Madison Square Garden was specially designed for exhibition purposes and readily lends itself to effective decoration and display. It was not until three years ago that its full effectiveness for automobile display was realized. Five previous exhibitions of the sort had been held within the superb structure, but then it was that the Association of Licensed Automobile Manufacturers, deciding to flock by itself, secured a lease of the building, and by lavish expenditure so transformed it into a semi-fairyland that a new standard for automobile shows was created; and as in no other structure is it possible to attain that standard, perforce the Garden show stands alone. Not only is the setting far more beautiful than that of any other exhibition, but even the "atmosphere" is different, due partly to the surroundings and in part to the fact that most of the manufacturers who display their cars are the pioneers of the industry and of wide repute.

The eighth automobile show to be held in the Garden will be uncovered Saturday evening next, November 2. It will be the third under the A. L. A. M. auspices and it will be in keeping with its two immediate predecessors.

The color scheme is to be gray and crimson and white. There will be no starry sky overhead, but the girders of the big dome will be screened by a canopy of soft material, rich, warm gray in tone. The exhibition spaces of the main floor and elevated platform will be carpeted with a specially woven fabric of deep crimson, with the visitors' aisles between sharply set off by the gray material. Entering from the foyer, the visitor will be confronted by a towering gateway, a replica of one at the Florio Toresca villa in Florence. Back of the real iron gratings of this gateway, will

Digitized by Google

be visible a garden wall with trees and shrubbery behind. While on canvas, this garden will have a literal perspective of seven feet, for the gateway structure has just that much depth. Beyond this entrance piece will extend the main display space, a broad path of rose hue, between the side aisles, with a row of ornamental pillars, fourteen feet in height, crowned by lamp globes extending along the middle. In the distance, at the Fourth avenue end, the vista will be that of Italian villas with terraced gardens of their own. This view will be presented by an immense painting, such as was used last year to mask the tiers of boxes and rear walls.

The plan of having the elevated platform above the arena boxes project slightly over the main floor and of covering the high rear seats so as to make a sort of mezzanine floor, will be repeated, but the idea has been extended and the lines of the Garden are to be further obscured and more space gained by decking over the first balcony, so as to have the flooring extending beyond the balcony railing and overlapping the elevated platform. For the edges of the balcony, the platform and mezzanine floor, special railings have been designed, which, like the lamp and sign pillars, will be finished in pure white. In the general view, these railings of the platform, mezzanine floor and balcony will rise in three rows at the sides and the downward and backward slope from the balcony railing to the supports will be dressed in the gray and crimson. The stairways from the main floor to the platform will be white, with the newel posts supporting ornate urns containing ferns and flowers. The lamp pillars on the main floor and other pillars, twelve foot high, on the platforms, will all bear shields displaying the names of the exhibitors whose space they mark, this being a distinctly new and artistic sign scheme. A few heroic statutes in staff work will adorn the platform.

The same gray and crimson scheme will be found in the cafe and basement, but in the latter place the walls which do not flank exhibits will be picture covered. A rathskeller with novel grotto effect will be located in an out of the way corner of the basement.

In the concert hall, a departure in the decorative scheme is to be made by arranging it as an adjunctory rose garden, set with latticed arbors in green and white. There will be an arched entrance, with lattices of the double diagonal pattern framed in white, a central dividing lattice down the hall, while the walls under the balconies and back of the stage will be finished with the same restful design.

Of late years the Garden shows have been shows of big, impressive cars; runabouts and even big little touring cars have been in a very respectful minority; the one which opens on Saturday will be notable for the increased number of still bigger cars, those of seven-passenger capacity and those with six-cylinder engines, which will then make their first appearance. Pierce and Franklin and Stevens-Duryea exhibited "sixes" last year, and on the forthcoming occasion they will be reinforced by Thomas, Winton and Olds, among others.

Ponderous limousines will be in abundant evidence, of course, but the so-called town car, with a four-cylinder gasolene engine, the short, light car of moderate power and of the landaulet type, will mark its beginning, its chief exponent being the E. R. Thomas Motor Co. and the Knox Automobile Co., although the single-cylinder Cadillac coupe, which is no stranger to show goers, will be there to testify that the town car idea is not wholly new even if it may have been amplified.

Two of the exhibitors will for the first time stage water-cooled models, Corbin and Knox, although this does not imply any diminished regard for their familiar air-cooled cars; it will, however, leave to the Franklin, the distinction of being the only all-air cooled line, and with their daring and radical development and adoption of concentric valves the Franklin exhibit should not lack notice at any time. The Columbia gasolene-electric car, which dispenses with gears and clutches, was shown last year, but it has been redesigned and has gained interest meanwhile and should therefore prove an object of keen attention.

To say nothing of improvements in previous models, such pioneers as Apperson and Haynes each will show an addition to their respective lines—the former one of 30-35 horsepower, the latter one of 45 horsepower. Studebaker also will disclose new gasolene models, while the Pope-Hartford will be presented as a redesigned car and not to remark mechanical improvements, the Pope-Toledo and the Cadillac, for instance, will be distinguished by new bodies that will somewhat change their familiar appearance. While embodying some few refinements, such cars as the Locomobile and the Packard will have their respective and known and proven quantities as their leading attributes.

In the electric department the greatest diversity of body design and appointment will be found, as usual, and among the commercial electric vehicles will be found the "startler" of the show—a "gas-electric road train," the invention of Alden Sampson, 2d, which will be exhibited by the Alden Sampson Manufacturing Co. The train comprises a tractor and several trailers, each of which carries an electric motor and transmission, in addition to an automatic steering gear, controlled by the operator on the tractor. The current supply for the entire train is developed by a gasolene-electric plant on the tractor, and the general principle of operation is the same as is used in ordinary suburban electric railway service.

For the first time since the A. L. A. M. took control of the Garden show, steam has been permitted to enter. It was limited to one representative and it goes without saying that the solitary representative will be the peerless White—peerless, for while dispute always will exist as to the merits of respective gasolene and electric cars, the world admits the leadership of the White in the steam class. There is no other that is to be mentioned in the same breath with it; and the White, too, will prove a worthy compeer of any car of any sort that may be staged anywhere.

Generally speaking, the show in Grand Central Palace which closed to-night, will have "taken the shine off" the tires and other accessories which will be exhibited at the Garden, but for all of that, the number of accessory manufacturers who were not at the Palace and will be in the Garden is surprisingly large.

The full list of exhibitors, their locations, and the wares they will display, is as follows:

Main Floor.

1. Pope Motor Car Co.—Pope-Toledo cars.
2. Royal Motor Car Co.—Royal tourist cars
3. Buick Motor Co.—Buick cars.
4. Autocar Co.—Autocars.
5. F. B. Stearns Co.—Stearns cars.
6. Elmore Mfg. Co.—Elmore cars.
7. Northern Motor Car Co.—Northern cars.
8. Lozier Motor Co.—Lozier cars.
9. Knox Automobile Co.—Knox cars.
10. Haynes Automobile Co.—Haynes cars.
11. Electric Vehicle Co.—Columbia cars.
12. Apperson Bros.' Automobile Co.—Apperson cars.
13. Locomobile Co. of America—Locomobile cars.
14. Packard Motor Car Co.—Packard cars.
15. Cadillac Motor Car Co.—Cadillac cars.
16. George N. Pierce Co.—Pierce Arrow cars.
17. E. R. Thomas Motor Co.—Thomas cars.
18. H. H. Franklin Mfg. Co.—Franklin cars.
19. Stevens-Duryea Co.—Stevens-Duryea cars.
20. Peerless Motor Car Co.—Peerless cars.
21. Pope Mfg. Co.—Pope-Hartford cars.
22. Olds Motor Works—Oldsmobiles.
23. Winton Motor Carriage Co.—Winton.

Elevated Platform.

24. Waltham Mfg. Co.—Waltham-Orient cars.
25. Matheson Motor Car Co.—Matheson cars.
26. Walter Automobile Co.—Walter cars.
27. Selden Motor Vehicle Co.—Selden cars.
28. Alden Sampson, 2d.
29. The White Co.—White steam cars.
30. Corbin Motor Vehicle Corporation.—Corbin cars.
31. Studebaker Automobile Co.—Studebaker cars.

Exhibition Hall.

32. Babcock Electric Carriage Co.—Babcock electric cars.
33. Studebaker Automobile Co.—Studebaker commercial cars.
34. Rauch & Lang Carriage Co.—R. & L. electric cars.
35. General Vehicle Co.—General electric cars.
36. Pope Motor Car Co.—Pope-Toledo commercial cars.
37. Columbus Buggy Co.—Columbus electric cars.

Digitized by Google

38. Electric Vehicle—Columbia commercial cars.
39. Baker Motor Vehicle Co.—Baker electric cars.

Basement.

41. Knox Automobile Co.—Knox commercial cars.
42. Royal Motor Car Co.—Royal commercial cars.
45. General Vehicle Co.—General electric commercial cars.
46. Northern Motor Co.—Northern commercial cars.
47. Pope Motor Car Co.—Pope-Toledo commercial cars.
48. Packard Motor Car Co.—Packard commercial cars.
49. Studebaker Automobile Co.—Studebaker commercial cars.
50. Alden Sampson, 2d—Crest trucks.
51. Champion Wagon Co.—Champion electric commercial cars.
52. Cadillac Motor Car Co.—Cadillac commercial cars.
53. H. H. Franklin Mfg. Co.—Franklin commercial cars.
54. E. R. Thomas Motor Co.—Thomas commercial cars.
55. Hewitt Motor Co.—Hewitt trucks.

Mezzanine Platform.

56. Diamond Rubber Co., Akron, O.—Diamond tires.
57. C. F. Splitdorf, New York City—Ignition specialties.
58. Goodyear Tire and Rubber Co., Akron, O.—Goodyear tires.
59. Shelby Steel Tube Co., Pittsburg—Tubing.
60. Dayton Electrical Mfg. Co., Dayton, O.—Ignition specialties.
61. G & J Tire Co., Indianapolis—G & J tires.
62. Gray & Davis, Amesbury, Mass.—Lamps.
63. Veeder Mfg. Co., Hartford, Conn.—Odometers and speed indicators.
64. R. E. Dietz Co., New York City—Lamps.
65. Atwater-Kent Mfg. Works, Philadelphia—Igniters and timers.
66. Byrne, Kingston Co., Kokomo, Ind.—Kingston carburetters.
67. National Carbon Co., New York City—Batteries.
68. Baldwin Chain and Mfg. Co., Worcester, Mass.—Baldwin chains and recoil check.
69. Brennan Mfg. Co., Syracuse, N. Y.—Brennan motors.
70. N. Y. and N. J. Lubricant Co., New York City—Lubricants.
71. Schwartz Wheel Co., Philadelphia—Wheels.
72. The Autocoil Co., Jersey City, N. J.—Coils and ignition specialties.
73. Hess-Bright Mfg. Co., Philadelphia—Bearings.
74. Webb Mfg. Co., Newark, N. J.—Speed indicators.
75. Swinehart Clincher Tire and Rubber Co., Akron, O.—Swinehart tires.
76. Light Mfg. and Foundry Co., Pottstown, Pa.—Automobile parts and castings.
77. Warner Instrument Co., Beloit, Wis.—Warner Auto-meters.
78. Morgan & Wright, Detroit, Mich.—Morgan & Wright tires.
79. Columbia Nut and Bolt Co., Inc., Bridgeport, Conn.—Columbia lock nuts.
80. Hartford Auto Parts Co., Hartford, Conn.—Universal joints and automobile parts.
81. Cook's Standard Tool Co., Kalamazoo, Mich.—Standard jacks.
82. The Auto Pump Co., Springville, N. Y.—Pumps and specialties.
83. Leather Tire Goods Co., Newton Upper Falls, Mass.—Non-skid covers and leather inner tubes.
84. Duff Mfg. Co., Pittburg, Pa.—Barrett jacks.
85. Precision Appliance Co., Chicago—Hill precision oilers.
86. Stewart & Clark Mfg. Co., Philadelphia—Spark plugs.
88. Chandler Co., Springfield, Mass.—Name plates.
89. Globe Machine & Stamping Co., Cleveland—Metal stampings.
90. Kilgore Mfg. Co., Old Town, Me.—Pneumatic shock eliminators.
91. Firestone Tire & Rubber Co., New York City—Firestone tires.
92. Oliver Mfg. Co., Chicago—Jacks and accessories.
93. Hartford Suspension Co., New York City—Hartford-Truffault shock absorbers.
94. Phineas Jones & Co., Newark, N. J.—Wheels.
95. Jones Speedometer Co., New York City—Jones speedometers, annunciators, odometers, speed regulators and specialties.
96. Pennsylvania Rubber Co., Jeanette, Pa.—Tires.
97. Motsinger Device Mfg. Co., Pendleton, Ind.—Motsinger automobile sparker.
98. Timken Roller Bearing Axle Co., Canton, O.—Bearings and axles.
99. Warner Gear Co., Muncie, Ind.—Gears and parts.
100. Remy Electric Co., Anderson, Ind.—Magnetos.
101. The Manufacturers Foundry Co., Waterbury, Conn.—Castings.
102. Brown-Lipe Gear Co., Syracuse, N. Y.—Transmissions, differentials and steering gears.
103. Pittsfield Spark Coil Co., Pittsfield, Mass.—Ignition specialties.
104. Whitney Mfg. Co., Hartford, Conn.—Whitney chains and keying system.
105. Standard Welding Co., Cleveland—Tubing and electrically welded parts.
106. American Ball Bearing Co., Cleveland—Ball bearings.

Depew Causes Santa Rosa to Dream.

Amos Depew, of Sherlock, Wis., wherever that may be, has caused Santa Rosa, Cal., to become excited by threatening to establish an automobile factory there. Amos wants a site of 10 acres, but why he should go so far from dear old Sherlock to obtain it, is not made clear. Lebanon, Ind., also has visions of an automobile factory coming its way, but the identity of the Amos in its case is not disclosed.

East Liberty Changes to Arlington.

Owing to the confusion often resulting from the mixing of the names of the East Liberty Automobile Company and the Liberty Auto Company, Pittsburg, the former has decided to change its title to the Arlington Motor Co. The new garage, rendered necessary by fire some time ago, which is being erected at 5971 Center avenue, will be ready for occupancy next week.

Smalley Plant Bought by Ames.

At the receiver's sale last week, the plant and property of the Smalley Motor Co., Bay City, Mich., the plant was purchased by G. W. Ames for $26,000, and the merchandise by C. A. Eddy for $6,250. The total inventoried value of the assets was $110,000.

The Highest Standard of Efficiency Ever Offered In Any Commercial Rnbber Tire At Any Price

Hartford Solid Motor Tires are absolutely protected from rust by the method of fastening them to the rims.

Hartford Solid Motor Tires are fastened in place by longitudinal wires imbedded and vulcanized in the body of the tire itself.

Hartford Solid Motor Tire retaining wires never come in contact with the moisture from the streets—hence

Hartford Solid Motor Tires are absolutely water-proof and are never affected by rust.

Hartford Solid Motor Tires are held in place by compression and in addition are clamped into position by side flanges—hence

Hartford Solid Motor Tires Never creep.

The Hartford Rubber Works Co., Hartford, Conn.

Matheson

THE MATHESON is standardized. The few changes for 1908 are unimportant refinements. As a matter of fact, most of these were incorporated in mid-season, in our '07 cars. This is the Matheson policy. We do not "save up" new features till the beginning of a new selling season. We neither expect nor desire Matheson owners to buy a new car every year, nor every other year. We are building today 1908 Mathesons, 1909, 1910, 1912 Mathesons, and he who invests will have, years hence, a car which will, after the hardest use, be running as strongly, as reliably, giving as efficient and as economical road service as any high class car then offered for sale. A 1906 Matheson stock touring car still holds the world's record for having carried seven passengers a mile in 50⅕ seconds. Most cars are bought:
Matheson cars are invested in.

Write for our new booklet, "I Drove My Matheson—" by Matheson owners, some of whom have made thousands of miles without even an adjustment, some of whom have gone through an entire season with a repair bill of nearly five cents. Better still, visit our exhibit, Space No. 25 in the gallery, at the Madison Square Garden Show. The Matheson sets a standard by which you may judge other high powered cars.

TIMKEN PRINCIPLE CORRECT

TIMKEN QUALITY SUPREME

Why is it?

49%

of all the makers that exhibited at The Grand Central Palace are using

Timken Roller Bearings

Not a question of cost surely, for there are others cheaper, so it must be a question of QUALITY, and that's the reason why makers of over **60%** of all High Grade American Automobiles and **95%** of all Trucks made in this country use TIMKEN PRODUCTS

WE WILL EXHIBIT AT

Madison Square Garden Show
New York, November 2-9

Chicago Coliseum & 7th Regiment
Armory Shows in December

The Week's Patents.

863,827. Vehicle Wheel. Joseph Alloatti, Gerzat, France. Filed Jan. 19, 1906. Serial No. 296,840½.

1. In a vehicle, a series of movable pistons arranged in rows transverse to the perimeter of said wheel and forming the tread thereof, means for guiding said pistons, spring means for retaining said guiding means, and elastic means arranged to receive the thrust of said pistons.

863,838. Gas Engine. John G. Ennis, Apponaug, R. I. Filed Dec. 31, 1906. Serial No. 350,197.

1. An explosive engine comprising a cylinder, a piston working therein, a crank shaft operated by said piston, valves for controlling the flow of explosive gases to said cylinder, means for reversing said valves and simultaneously igniting the gases in said cylinder, whereby said engine is caused to run in the opposite direction.

853,848. Automobile Wheel. Adolph Heldman, New York, N. Y. Filed Sept. 19, 1906. Serial No. 335,217.

1. In a wheel the combination of a main rim and auxiliary rim adapted to fit around the main rim and arranged to carry a tire, both rims being tapered toward the wheel's axis, fasteners arranged to straddle the main rim and to embrace the auxiliary rim, and means for holding said fasteners.

863,864. Friction Clutch. Albert Master. Chicago, Ill. Filed Feb. 4, 1907. Serial No. 355,555.

1. A friction clutch comprising a member having a series of axially extending guide grooves or ways, a circular series of friction blocks having lugs engaging and sliding in said grooves or ways, said blocks being independently shiftable in axial direction upon said clutch member and a second clutch member comprising a pair of oppositely disposed jaws and means for shifting said jaws to grip said friction blocks, substantially as described.

than D. Maxwell, Tarrytown, N. Y., assignor to Maxwell Briscoe Motor Company, North Tarrytown, N. Y., a Corporation of New York. Filed Dec. 31, 1904. Serial No. 239,160.

1. Power transmitting and controlling mechanism for automobiles and the like, comprising a gear case having a plurality of chambers; an engine having a driving crankshaft and connecting rods in one of said chambers, and a clutch device, speed changing devices and a driven shaft in another of said chambers, substantially as described.

864,016. Clutch and Drum. Jonathan D. Maxwell, Tarrytown, N. Y., assignor to Maxwell-Briscoe Motor Company, North Tarrytown, N. Y., a Corporation of New York. Original application filed Dec. 31. 1904, Serial No. 239,161. Divided and this application filed Sept. 28, 1905. Serial No. 280,450.

1. In a plate clutch for power transmitting apparatus, driving and driven plates alternating in series, means adjustable in an annular field to maintain said plates in operative contact, and a spring wear disc

864,015. Transmission Gearing. Jona- intermediate said means and plates, substantially as described.

864,077. Timer. Harry A. Butler and Franklin C. Peterson, Haverford, Pa. Filed Jan. 27, 1906. Serial No. 298,140.

1. A timer comprising a sliding contact, means tending to press the contact in one direction, and a rotary cam member engaging the contact, said member normally restraining and periodically releasing the contact.

864,089. Wheel for Vehicles. Airry L. Finnell, New York, N. Y. Filed Dec. 30, 1905. Serial No. 294,011.

1. A wheel for vehicles comprising a series of radial spokes secured to a central hub and projecting through a surrounding inner rim and an outer tire rim, and movable spacing blocks between the inner and outer rims said spokes being provided with surrounding springs between the hub and inner rim, substantially as shown and described.

MICHELIN

FRANCE, ENGLAND, ITALY, AMERICA.

The car equipped with Michelin Tires is the car which will be the easiest to sell in 1908. Manufacturers can now afford to equip with Michelins. No more Duty—no more Trans-Atlantic Transportation Charges.

Michelin Tires included in a car's equipment means that the manufacturer is scrupulously careful to give in every way the BEST, the MOST for the customer's money. Michelins will be used on a large number of America's highest priced cars and they will be the standard catalogued equipment of leading cars in other classes.

What excuse can an agent give a customer for trying to sell him a car not equipped with Michelins?

The high import duty and heavy trans-Atlantic transportation charges on Michelin tires have been removed through the erection of our American Michelin factory. Its tires are identical in every particular with the products of our factories in France and Italy—the same famous Michelins which have been on the winning cars in the world's greatest races for the last six years and which made their victories possible.

It is the manufacturer's duty to his agents to give them the best selling proposition possible—his duty to the purchaser to give him the greatest possible value for his money. Michelin Tires are the world's standard. A car can hardly hope to be classed as standard that is not standard in every particular of its equipment.

Garford

A DEFINITION:

TALKING POINTS—Features of mechanical design in which engineering considerations are subordinate to those of advertisement and sale. They are always unnecessary, seldom advantageous and frequently injurious.

"Talking Points" have been shunned in the design of "The Garford." The Garford Company recognizes an "orthodox type." As THE TYPE improves we propose to anticipate, if possible, that improvement. But we will not abandon the fruits of the costly experience of all makers, and claim difference where the claim ought to be conformity to "THE TYPE," and where in the case of the Garford Company it is conformity.

CONFORMITY AT ANY TIME MEANS SUITABILITY

FORMERLY
OLIVER INSTRUMENT CO.

MINNEAPOLIS, MINN.

It was found that

3 Out of Every 4 Tourists
had used
Warner Auto-Meters

Yes, sir; of the 48 cars that finished at New York in this year's Glidden Tour, exactly 36 carried Warner Auto-Meters. Just think of that! Three times as many Auto-Meters were used by these experienced motorists as there were of all other speed-and-distance indicators combined!

This sweeping victory for Warner Auto-Meters, followed last year's equally creditable performance in the Glidden Tour, and the recent notable triumphs in the Chicago Sealed Bonnet Contest and the Boston Endurance Race, establish beyond the possibility of a doubt that the Warner Auto-Meter is the only speed-and-distance indicator that can be depended upon to do the work right at all times and under all conditions.

Accurate as a Watch—Reliable as a Compass

Warner Auto-Meters are made on the proven-successful magnetic principle. They're just as reliable and durable as a mariner's compass. No matter how rough the road, you can tell at a glance exactly how fast you are going. The arrow never flutters or bobs back and forth. The Warner Auto-Meter is as accurate as a watch.

You ought to have an Auto-Meter on your machine—it doubles the pleasure of autoing, helps you to control your machine and frequently saves embarrassing situations in the police court.

You'll notice the handsome little Auto-Meter on most of the best cars. Take a look at it; inquire about it—nearly all automobile dealers sell Auto-Meters.

Write us the name and power of your car, and we'll tell you just what it will cost you to put an Auto-Meter on the dashboard.

The Springfield Motometer

Presents New and Valuable Features

The Maximum Hand: Marks highest speed attained. Resets instantly. Can be disconnected in a moment.

New Easy Reading Dial—Big plain figures. Fired Enamel. Reads from the tonneau.

Spring Steel Reinforce on each end of the driving shaft. Compels easy curves and smooth running. Far better than gears.

Non-Clogging Pinion. Mud proof. Will not hold mud. A rainy weather necessity.

With these additional excellences, the Motometer is more than ever "The Speedometer for Service."

Remy Magnetos

which have become so well known to the automobile world and which have gained such great favor among their many users, are now being manufactured in the best equipped plant in the world devoted to the exclusive manufacture of Magnetos. This new factory, a model from the standpoint of efficient arrangement and high class equipment, together with perfected designs which are the results of years of experience in this line of manufacture, makes possible the turning out of the very highest grade ignition apparatus on the market.

For 1908 our line includes a new high tension Magneto without coil, which we build in large quantities and are selling at a medium price. It is simple, small and well made. It can be installed with minimum expense and is a high grade equipment in every respect. We also build Magnetos with coils for double ignition, and alternating and direct current Magnetos for all ignition purposes. It will pay you to investigate our Magnetos before deciding upon your ignition equipment for your 1908 cars.

We will exhibit at both New York Shows and the Chicago Show.

"WHITNEY" CHAINS

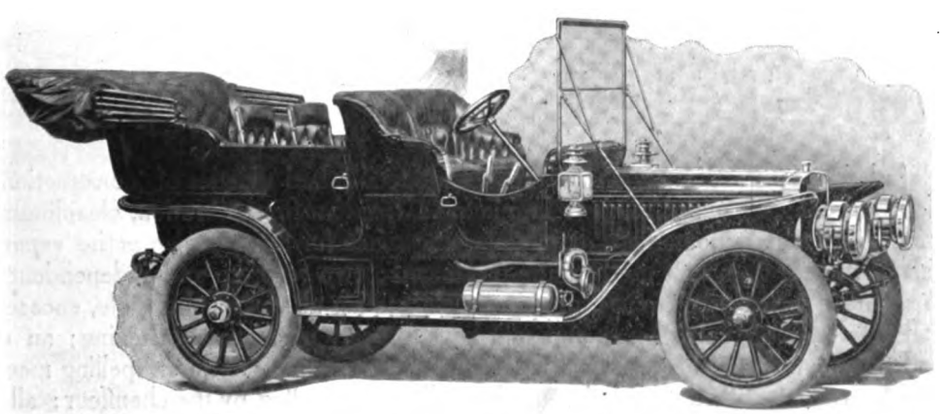
January 1, 1907 to November, 1, 1907, conditions as follows:

On January 1, 1907, we were renting about 38,000 square feet of floor space in a building not adapted for our growing business. At the same time we were giving much attention to our new buildings which were under construction, and not completed until July, 1907. During this period we moved our entire equipment to our new factory and for a number of weeks were obliged to operate machinery in both plants. We also carried on important experiments and constructed much special apparatus for our new factory. While thus handicapped we could not fully meet the increasing demand for "Whitney" Chains.. Nevertheless, we succeeded in shipping a greater number than ever before for an equal period of time.

Patented

"WHITNEY" CHAINS

November 1, 1907, to December 31, 1908, conditions as follows:



New fire-proof factory, one of the best, strongest and safest in the country. Floor space over 70,000 square feet. Best of light and excellent conditions for employes. Location one of the best in Hartford. Private side-track connecting with main line between New York and Boston. Land area over ten acres. Large increase in new machinery and tools. Improved methods. Inspection system more rigid than ever. Greater accuracy. Increased strength by the use of new materials and improved treatment. Greater durability. Better finish.

THE WHITNEY MFG. CO., - Hartford, Conn.

1908 Announcement

Pope-Toledo Type XVII

Its keynote of design is close attention to those fine details and niceties of construction which enhance the comfort and convenience of the user in quietness, freedom from vibration, cleanliness, speed, luxurious accommodations and appointments, ample carrying space for luggage; an entire separation of the mechanical part of the car from that used by the passengers; two separate and independent systems of ignition on two separate sets of spark plugs, practically eliminating all electrical trouble, encased noiseless Chrome Nickel Steel chains; castled nuts and split keys to every mechanical fastening; an enclosed detachable pan under the whole car to prevent the entrance of dirt or water to the propelling mechanism; an entire absence of brass parts, blued steel being used on all parts handled by the chauffeur; all handles and fittings in that part of the car occupied by the passengers covered with fine seal leather; double extension robe rail, folding detachable seats, dress-suit cases for the ladies' apparel and pockets for the gloves, goggles and other articles.

We take great pleasure in announcing to our dealers and many friends of the Pope-Toledo Car that our new models are

Rainier

"The Pullman of Motor Cars"

GUARANTEED FREE OF REPAIRS FOR ONE YEAR

OUR NEW PLANT, FROM WHICH IS COMING THE 1908 "MODEL D," TO ADD TO RAINIER FAME.

SOUND business economy demands that in selling a car under our original and distinctive guarantee, "Free of repairs for one year," that the chief expenditure must be at the beginning, that is, at the factory and, in material and construction, instead of in the local repair shops: Therefore our new factory at Saginaw, Mich.

The new plant comprises sixty acres of ground, with spacious brick buildings, in which every piece of machinery is new and specially designed for building the RAINIER. Nothing has been omitted that would tend to insure accuracy and superlative quality. James G. Heaslet, the original designer of RAINIER cars, is responsible for the 1908 RAINIER, which is higher-powered and more strikingly than ever a "Pullman" in quality and finish. "Quality, not quantity," is our factory watchword, and the 1908 output has been limited to 300 cars.

Rainier

"The Pullman of Motor Cars"

GUARANTEED FREE OF REPAIRS FOR ONE YEAR

1908 "Model D," 45-50 H. P.

SPECIFICATIONS

ENGINE—Rated H. P., 45-50; four cylinders, vertical, cast in pairs; 5-inch bore, by 5¼-inch stroke; cylinders hard gray iron castings, accurately ground to size; pistons light but rigid, ground to fit; valves on opposite sides, mechanically operated, all interchangeable; cams forged integral with shafts; crank shaft nickel steel forging, with bearing surface ground; main engine bearings and connecting rod bearings of finest babbitt metal, enclosed in bronze cases, a construction the same as that in the highest priced imported cars.

IGNITION—Make-and-break system, with Simms-Bosch, low tension magneto, but with a greatly improved and simplified mechanical sparking device, insuring accurate timing and minimum need for adjustment; one upright ignition shaft in place of four.

LUBRICATION—Positive feed mechanical oiler, driven by gear from the cam shaft, provides for engine bearings, magneto and pump shaft; Cylinders and pistons fed by splash system.

CARBURETER—Improved automatic type, having auxiliary air control on dash; feed by gravity flow through trap and screen; Capacity of gasoline tank, 20 gallons, two in reserve.

COOLING SYSTEM—Extra large radiator with fan running mounted on a pedestal over the timing gear case; fan belt runs vertically, driven by a pulley directly on the crank shaft.

CLUTCH—Multiple disc, alternate bronze and steel plates, running in oil; very sensitive touch.

TRANSMISSION—Selective type of gears, four speeds forward and one reverse, direct drive on third speed; shafts and gears nickel steel, and shafts mounted on imported ball bearings; counter shaft located below driving shaft, enabling use of sealed bearings, thereby avoiding oil leakage.

PROPELLER SHAFT—Nickel steel, with new and improved universal joints; driving pinion forged integral with the shaft.

REAR AXLE—Driving axle of floating type, with hubs mounted on tubular axle which carries the weight of the car; drive is bevel gear through clutch driven hubs; driving gear housings manganese bronze, while differential case is drop forging.

BRAKES—Hand and foot brakes, mounted on rear wheel drums, both interior expanding; hand brake pulls towards operator.

FRONT AXLE—Drop forging, manganese steel, I beam section; wheel hubs mounted on imported annular ball bearings.

WHEELS—36-inches with 1¾-inch spokes, second growth, grade A hickory.

TIRES—Rear 36 x 4½-inch, front 36 x 4-inch. Make optional.

FRAME—Pressed nickel steel, with 2½-inch drop forward of rear axle.

CONTROL—Spark and throttle on steering wheel, with stationary segment and foot accelerator pedal.

MUFFLER—Cut-out on all cars.

WHEEL BASE—119 inches.

SPRINGS—Front, semi-elliptic; rear, improved type of platform or three point suspension; size of springs greatly increased; quality of spring steel is most expensive and finest obtainable.

BODY—Double side entrance, seven passenger capacity, full aluminum, ironed for top; extra seats can be folded or removed instantly.

EQUIPMENT—Two acetylene head lights, generator, two oil side lights, oil rear light, large horn, brass coat rail, brass foot rest, tire carriers, trunk rack, tool box on step with full set of tools, including pump, jack and tire repair kit.

WEIGHT—2,850 pounds.

PRICE—$4,500.

The Value of a Motor Car

is not determined by its list price, but by its *construction* and *performance*. The 1908 PREMIERS embody structural features not to be found in other cars, and these special features do not savor of freakishness. Their clean, efficient motors with double ignition systems, enclosed multiple disc clutch, large braking surfaces, unusually wide pressed steel frame members, clutch drive rear axle, large roomy bodies, are all features which appeal to those who *know*—the *"motor wise."* We believe that a careful comparison with any other cars relatively the same size and power, without reference to price, will result favorably to the

PREMIER

"The Quality Car"

The PREMIER was awarded perfect score in the 1907 Glidden Tour; in Chicago endurance and sealed bonnet contests; holds world's record for non-stop run—4,906 miles; Boston-New York single and round trip records; Boston-Worcester record, and numerous others.

Model 45—7 passenger touring car; 45-55 horse-power; make-and-break ignition with Bosch low tension magneto and high tension jump spark with storage battery; 124-inch wheel base. Price, $3,750.

Model 30—5 passenger touring car; 4 cylinders, 30-35 horse-power; make-and-break ignition with Bosch low tension magneto and high tension jump spark with storage battery; 108-inch wheel base. Price, $2,600.

Model 24—5 passenger touring car; 4 cylinders, 24-30 horse-power; jump spark ignition, with storage and dry batteries; 108-inch wheel base. Price, $2,250.

ADVANCED IDEAS IN DESIGN

You are going to the Automobile Show to find out what is new in the industry—to keep posted on the latest developments and improvements in motor cars.

As in former years, experts always watch the Haynes exhibits. From the time when Elwood Haynes built the first American gasolene car (now in the Smithsonian Institute) the Haynes has always held the leadership in invention—not in passing freak devices, but in those features such as the magneto, the side entrance, large wheels, aluminum alloy, etc., etc., which have since become permanent features of all cars.

In the present year, the leadership of the Haynes in correct invention is still unchallenged. These are the unique features of the 1908 Haynes which we invite you to examine at the Show:

1. The roller-pinion-and-bevelled-sprocket direct drive. This device replaces the troublesome bevel gears and reduces rear axle strains. It makes shaft drive possible even in our high-powered Model U, and this model is probably the only high-powered car at the Show which does not have those noisy, stretching and mechanically incorrect side-chains.
2. The unique Haynes Master Clutch. This Clutch works like a band brake, metal to metal. It takes up the load smoothly and gently, without jerking. No leather to renew.
3. The Haynes Change-Gear System. This embodies a ratchet and pawl device which makes the burring and stripping of the gears impossible and entirely prevents shock to the mechanism when changing from a high to a lower gear.
4. The Haynes Unbreakable Universal Joints, the wear on which is taken by large flat surfaces instead of light pins.
5. The Roller-Bearing Power Route, all the way from piston stroke to the hub of the road wheel.

The Haynes is made in three models, all embodying the above advanced devices.

A NEW Columbia 7 Passenger MOTOR CAR With ELECTRIC TRANSMISSION

Electricity is not a prime power agent, yet as a means of transmission and control of power it has supplanted all other methods in steam railroads, street railroads, warships, factories, etc., and in the new high powered 7 passenger gasoline car electricity has supplanted all friction clutch, gear boxes and shifting levers.

Also: the light Columbia touring car, runabout and limousine has many and important improvements for 1908

Franklin

Six-cylinder Franklin $4000

What's six cylinders for?

More power per weight—means more "do;" more "go."

What a mistake, therefore, to add a ton of weight with the extra two cylinders!

The Franklin six-cylinder weighs only 300 pounds more than the Franklin four-cylinder.

Strong? What other automobile could have stood that 15-day trip from San Francisco to New York?

1908 Franklin Models

THOMAS

THE E. R. THOMAS MOTOR CO. presents four styles of chassis and nineteen styles of bodies

Thomas 4-20 Town Car

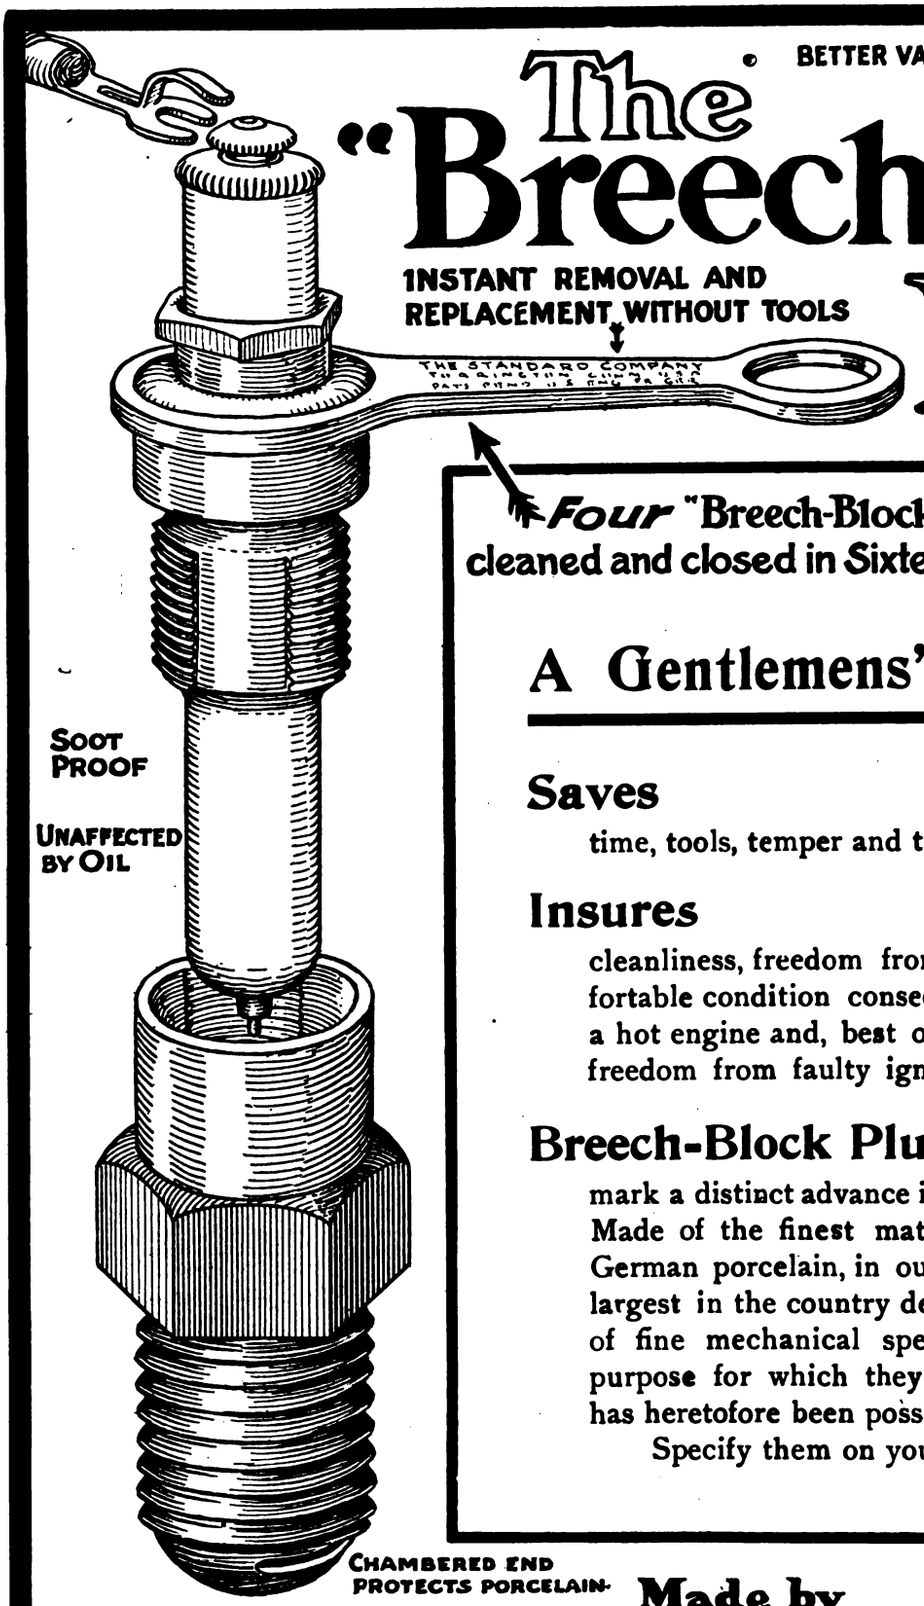
Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, $3,000 to $3,250.

Thomas 4-40 Detroit

A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse at a much lower price, shaft driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, $2,750 to $3,750.

Thomas 4-60 Flyer

The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, landaulet and limousine bodies. Prices, $4,500 to $5,700.



Thomas 6-70 Special

This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, $6,000 to $6,900.

BETTER VALUE THAN ANY OTHER PLUG MADE

The "Breech-Block" Plug

INSTANT REMOVAL AND REPLACEMENT WITHOUT TOOLS

Four "Breech-Block" plugs can be opened, cleaned and closed in Sixteen Seconds by the watch.

A Gentlemens' Spark Plug

Saves

time, tools, temper and trouble;

Insures

cleanliness, freedom from the "fussed-up" uncomfortable condition consequent of working around a hot engine and, best of all, insures comparative freedom from faulty ignition.

Breech-Block Plugs

mark a distinct advance in spark plug construction. Made of the finest materials, including genuine German porcelain, in our own factory (one of the largest in the country devoted to the manufacture of fine mechanical specialties), they fulfill the purpose for which they are designed better than has heretofore been possible.

Specify them on your cars.

TRUFFAULT-HARTFORD SHOCK ABSORBER

"Renders Real Rough Road Relief"

¶ The spring action of a car affects its smooth running qualities. Proper control of the springs prevents excessive oscillation, which insures LESS WEAR and TEAR, LONGER LIFE OF TIRES, GREATER SPEED AND GENUINE COMFORT.

¶ This control of the springs can be secured only by the use of TRUFFAULT-HARTFORD Shock Absorber—the device that has made SAFE, ECONOMICAL AND COMFORTABLE automobiling possible.

¶ In the 1908 model we believe that we have practically obtained perfection.

¶ A distinctly new feature has been added, consisting of a regulating dial with indicator, making it possible for even a novice to obtain a perfect and uniform adjustment to suit the exact requirements of the car as measured in terms of its gross weight, and easily secure the maximum benefit.

¶ The Truffault-Hartford is the only spring retarding device manufactured with a regulating dial. It is automatically lubricated, absolutely dust and water proof, interchangeable, practically indestructible and *fully guaranteed*.

¶ Twenty prominent automobile manufacturers now use the Truffault-Hartford Shock Absorber exclusively as part of the regular equipment of their cars.

¶ Write for our "Ruff Road" booklet, Dept. I, or a demonstration will convince you—see us at the shows.

The Anti-Fatigue Car

It never grows weary of well doing. All are beginning now to realize what the users of it and its builders always have known—that the

American Locomotive Motor Car

is the "greatest touring car in the world, bar none." Tourists boast that with this machine they can always keep their schedule and those who have driven it farthest, say:

"IT STAYS NEW"

Imported Materials. American Workmanship.

Vanadium, "the anti-fatigue metal," is in ALL its steel and iron.
What lasts best. *is* best.

The energies and backing of a $50,000,000 company are behind it.

AMERICAN LOCOMOTIVE AUTOMOBILE COMPANY

Matheson

THE MATHESON is standardized. The few changes for 1908 are unimportant refinements. As a matter of fact, most of these were incorporated in mid-season, in our '07 cars. This is the Matheson policy. We do not "save up" new features till the beginning of a new selling season. We neither expect nor desire Matheson owners to buy a new car every year, nor every other year. We are building today 1908 Mathesons, 1909, 1910, 1912 Mathesons, and he who invests will have, years hence, a car which will, after the hardest use, be running as strongly, as reliably, giving as efficient and as economical road service as any high class car then offered for sale. A 1906 Matheson stock touring car still holds the world's record for having carried seven passengers a mile in 50⅕ seconds. Most cars are bought:
Matheson cars are invested in.

Write for our new booklet, "I Drove My Matheson—" by Matheson owners, some of whom have made thousands of miles without even an adjustment, some of whom have gone through an entire season with a repair bill of nearly five cents. Better still, visit our exhibit, Space No. 25 in the gallery, at the Madison Square Garden Show. The Matheson sets a standard by which you may judge other high powered cars.

1908 Elmore Valveless 2-Cycle 1908

The information which it contains is so remarkable— so very much out of the ordinary—that this advertisement will have failed in its purpose if it does not impel you to consult with the nearest Elmore agent at once.

The Elmore agent is prepared to show you:—A car which will run for 2,000 miles on one set of ordinary six-inch dry cells.

A car that will drain those cells to so low a point that cells ordinarily discarded as useless for others cars will operate the Elmore.

A car in which all troubles due to batteries, timer or coils are cut out altogether.

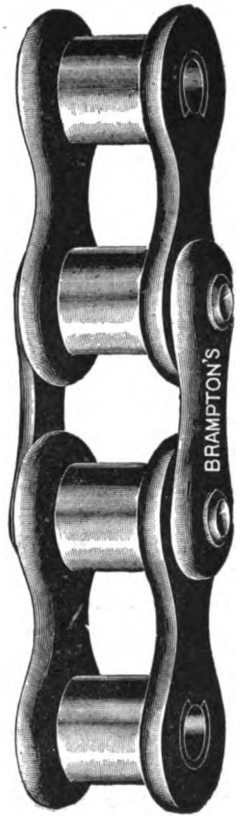
A car in which the ignition system ceases to be any occasion for thought or care at all.

A car which has not a single valve and consequently none of the troubles incident to valves, cams or springs.

A car equipped with continuous turning power which means—no idle stroke—and an impulse from each cylinder with every turn of the fly wheel.

A car in which the repair cost is practically nil because it contains none of the deficiencies or complications in engine construction, ignition system or usage of valves by which repairs are rendered necessary.

A car that to the unbiased investigator puts the four-cycle theory of construction into a defensive attitude and has helped to hasten the widespread adoption of the six cylinder idea—a vain effort to approach thro' increased cylinders, cost and complications, the marvelous efficiency of the Elmore continuous torque.



A car that is doing so many almost unbelievable things in the hands of several thousand owners that our chief difficulty is to find plain English words which will convey to you an adequate idea of the wide gulf that separates it from the ordinary four-cycle car.

Write for the Elmore literature—but see an Elmore agent.

THE BRAMPTON CHAIN

The **stongest** chain in the world; made of **self-hardening steel** with large spun rivets, chamferred side plates (no sharp edges). All parts of this chain are polished and fit the sprockets (which are properly cut) without friction.

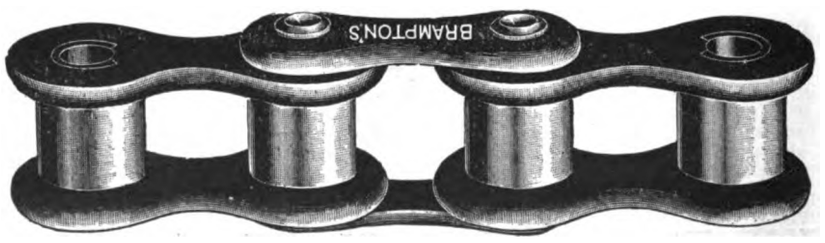
Imitation, What's the Definition?

Some chain manufacturers have copied the Brampton chain as near as they could. Their chain somewhat resembles the Brampton chain in appearance, but they have been unable to copy the material **(self-hardening steel).**

No change has been made in the construction of the Brampton chains in the past ten years. **What does that signify?**

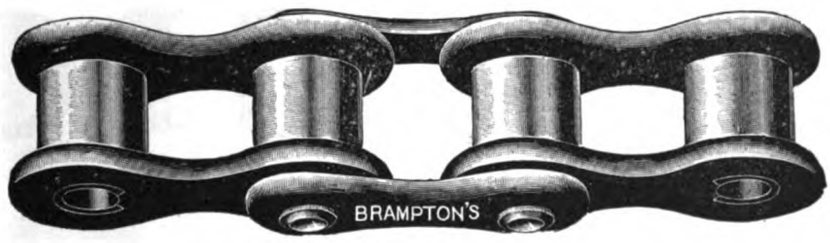
Our price list is not copyrighted and our competitors are welcome to use it. One of them has done so, using our numbers, sizes, prices and descriptive matter.

It is therefore easy to be seen that the Brampton chain is The One Standard of the World.



All Brampton Chains are stamped with the name Brampton on each outside link; Beware of the imitators and get the genuine Brampton.

PRICES THE SAME AS AMERICAN-MADE CHAINS.



We are the Sole American Agents. Catalog on request.

Rambler

Model 34
$2,250

In this car is embodied every modern feature that has withstood the severe test of practical service, and each has been refined and developed to the highest degree of mechanical perfection.

Through the offset crank shaft, straight line drive, direct from transmission gear to rear axle without an intervening joint, and ball or roller bearings at every point in the transmitting system, every ounce of cylinder pressure is delivered to the road wheels with the lowest possible loss in efficiency.

Equal improvements have been made in accessibility, comfort and outward appearance, and we offer this car as the equal, from every practical standpoint, of any car on the market, regardless of price.

We invite your most thorough examination, positive that it will convince you of the superiority of the Rambler.

Exhibited and demonstrated during the period of the New York Show at Homan & Schulz Co., 38-40 West 62d Street, New York City

Our advance catalog, describing in detail this car, both as touring car and roadster, and the new utility car, Model 31, is at your disposal. Write for it now.

Volume XVII. New York, U. S. A., Thursday, November 7, 1907. No. 6

BUDLONG NOW A. L. A. M. MANAGER

Former Hartford Man Chosen to Succeed Cutler—Clifton Re-elected President and G. H. Day a Committeeman.

M. J. Budlong is once more a large cog in the automobile industry—this time as general manager of the Association of Licensed Automobile Manufacturers, to which post he was elected yesterday to fill the vacancy made by the retirement of E. H. Cutler.

When Budlong resigned the presidency of the Electric Vehicle Co. and went abroad some two months ago, it was a safe assurance that a man of his tact and ability would not long remain out of harness. Since his return from Europe he has not lacked proposals and that he chose to become the manager of the A. L. A. M. is no surprise. After the embarrassment of the Knox Automobile Co., of which he was the head, it was known that E. H. Cutler would retire and Mr. Budlong has been for several weeks mentioned as his most likely successor. As the representative of the Electric Vehicle Co., Budlong had been a member of the executive committee of the A. L. A. M. from the time of its organization, and in consequence is familiar with its affairs.

Hardly less notable that Mr. Budlong's election is the return of George H. Day, the father of the A. L. A. M., as one of its active counsellors. He was made a member of the executive committee at the annual meeting which occurred yesterday in the New York office of the association.

Thirty of the thirty-one firms holding membership in the association were represented at the meeting, and the election of officers resulted as follows: Charles Clifton, George N. Pierce Co., president; Thomas Henderson, Winton Motor Carriage Co., vice-president; H. H. Franklin, H. H. Franklin Manufacturing Co., treasurer, and L. H. Kittredge, Peerless Motor Car Co., secretary. The new executive committee chosen comprises President Clifton, who has proven the right man in the right place; George H. Day (Electric Vehicle Co.), William E. Metzger (Cadillac), S. T. Davis, Jr. (Locomobile), and Thomas Henderson (Winton). Mr. Henderson succeeds F. L. Smith of the Olds Motor Works. Mr. Smith asked to be relieved, as he finds it impossible to get to New York to attend the regular meetings of the committee.

Shoemaker Tangled in Two States.

Before the Shoemaker Automobile Co. had removed all of its effects and money from Freeport, Ill., to Elkhart, Ind., the funds in bank that remained in the former place, were attached by Frank W. Stewart on a claim of $3,737.50, alleged to be due for commissions on the sale of the company's stock. The papers in the case were served at midnight. In Elkhart, too, some of the subscribers to the fund that induced the Shoemaker company to remove to that point became timid and refused to pay the amounts subscribed until they actually saw the factory in operation. As a result, Charles E. Clark, manager of the concern, applied for the appointment of a receiver. The proceeding was a friendly one and is understood to be in the nature of a protective measure.

Court Deals with Pope Affairs.

As the Motor World stated would be the case, George W. Yule, the head of the Badger Brass Mfg. Co., and chairman of the creditors' committee, has been formally appointed permanent co-receiver of the Pope Mfg. Co. At the same time Albert L. Pope's appointment as temporary receiver was made permanent. They are required to file a joint bond of $200,000. For his services as temporary receiver, Mr. Pope was allowed by the court the sum of $2,500; and the two appraisers of the Connecticut property, Fred C. Billings and John R. Hills, were each allowed $1,000. In the course of the proceedings it was made known that during his term as temporary receiver Mr. Pope had conducted the business without borrowing a penny.

HENDERSON NEW HEAD OF N. A. A. M.

No Other Change Made at Annual Election —Retiring President Urges Conservatism—Initiation Fee Now $500.

Thomas Henderson, of the Winton Motor Carriage Co., Cleveland, is the new president of the National Association of Automobile Manufacturers. He was elected to the office at the annual meeting of the organization held in New York City yesterday. All other of the incumbents were re-elected as follows: Vice-president, S. D. Waldon, Packard Motor Car Co.; second vice-president, William E. Metzger, Cadillac Motor Car Co.; third vice-president, L. H. Kittredge, Peerless Motor Car Co.; secretary, C. C. Hildebrand, Stevens-Duryea Co.; treasurer, William R. Innis, Studebaker Automobile Company. In accordance with the request of the American Automobile Association for the appointment of a conference committee, the president was instructed to make such an appointment. The suggestions relative to racing on circular tracks recently adopted by a conference under the auspices of the American Automobile Association, were fererred to the contest committee for action.

Immediately preceding the session of the executive committee, the general meeting was held at which Charles Clifton (Pierce), William E. Metzger (Cadillac), S. T. Davis, Jr. (Locomobile), S. D. Waldon (Packard), and L. H. Kittredge (Peerless), the members of the executive committee, were re-elected to serve for a term of three years.

The general meeting also amended the by-laws by increasing the initiation fee from $25 to $500.

The report of the retiring president, Albert L. Pope, was of uncommon interest. He warned the members of the association that a conservative course would be the best one to pursue for some little time as regards their plans for marketing cars. Hegards their plans for marketing cars.

In the Retail World.

J. E. Kennedy & Co., of Crawfordsville, Ind., have opened a new garage.

H. B. White is erecting a brick garage at 1325 Mount Curve avenue, Minneapolis, The cost is estimated at $5,000.

The American Auto Co., a new company of Cedar Rapids, Iowa, has purchased the interests of the Henderson Auto Co., of that city.

The Lichtie Automobile Co., of Toledo, O., is building a new garage at Eleventh and Madison avenue; it will be completed the first of December.

The recently organized Owego Motor Co. of Owego, N. Y., will erect a concrete building to be occupied as a garage. It will be on Central avenue, and is to cost $3,000.

Beloit, Wis., is to have a new garage to cost $7,000, located on Broad street, just outside the business center of the city. Mrs. C. R. Robinson will own it and Harry Vale is to be manager.

William Oldknow and John F. Kiser, of Atlanta, Ga., have petitioned for incorporation of the American Motor Car Co., to be capitalized at not less than $1,000, and to act as an automobile sales agency.

F. H. Osler, of Pomona, Cal., is having plans drawn for a brick building on Third street, between Main and Thomas. He will occupy it with his pump, engine and automobile business on its completion.

Schedules in bankruptcy filed by the Manufacturers Motor Car Co., New York, garagemen, disclosed assets of $8,232, and liabilities of $11,692. Of the assets $6,987 is represented by accounts and $2 by real cash.

Philip Drenner, Dixon's (Ill.) pioneer blacksmith and wheelwright, is "going into" automobiles. To make room for the new business he has built an addition 57x 28 feet, and besides conducting a repair shop, will have an agency.

G. L. Hudkins has built a large garage on South Pennsylvania avenue, Cawker City, Kan., and will operate a general garage and livery business. Three touring cars and twelve runabouts have been purchased for the conduction of the latter.

A slight fire, supposed to have been caused by spontaneous combustion, slightly damaged two or three cars in the sales rooms of the W. A. Frederick Co., 16 Columbus avenue, Boston, Tuesday of last week. The damage is estimated at $1,500.

The Spear Automobile Company has opened on Exchange street, near Federal, Portland, Me. William Dugan is president, Hon. Charles N. Trefethen vice-president, and Albert M. Speare, Jr., manager. The company will have the agency for Ford cars.

John Vaile and his son, John, Jr., have purchased a controlling interest in the Fort Smith (Ark.) Automobile & Supply Co. As the stock purchased represented the holdings of Samuel McCloud and A. N. Sicard, the latter president, change in officers will be necessary.

Putting new wicks in the lamps of an automobile for a party from Newark resulted in a fire in Browne & Schmidt's garage on Paterson street, Paterson, N. J., about midnight, Sunday, 3d inst. When the lamps were lighted a lamp tray which had been set on the floor burst into flames. The premises were considerably damaged and serious injury was caused to four automobiles. Two employees were badly burned while endeavoring to check the flames before the arrival of the firemen.

Still More Shrinkage in Imports.

The shrinkage of imports continues in increasing proportions, the decline shown by the statistics for the month of October amounting to $217,586.15. The number of automobiles entered was 202, or 18 less than in October, 1906, the appraised value being $591,466.63, as against $809,052.78. The total imports for the ten months ending with October numbered 1,093 cars, valued at $4,064,249.84; for the corresponding period in 1906 there were brought into thi scountry 1,302 cars valued at $4,605,315.21; the decline in imports thus shown for the ten months was 209 cars, and $541,065.57 in appraised valuation.

Plan to Continue Dolson Business.

Creditors and stockholders of the Dolson Automobile Co., Charlotte, Mich., have agreed upon a plan for carrying on the affairs of the company. The creditors are to take 50 per cent. of their respective claims in stock, 5 per cent. in cash and the balance in long time notes. The stockholders are to raise an additional $30,000 preferred stock. If the plans go through as marked a new board of directors will be elected consisting of three named by the creditors and two by the stockholders.

Drake and Lamb in New Places.

F. A. Drake, former manager of the Fisk Rubber Co.'s New York branch, has been added to the staff of the G & J Tire Co. The vacancy in the Fisk depot has been filled by the transfer of W. J. Lamb, who hitherto has cared for the Fisk interests in Detroit.

Empire Opens New York Depot.

The Empire Automobile Tire Co., Trenton, N. J., has established a New York depot at Seventy-third street and Broadway. It is in charge of Marcus Allen, former manager of the Auto Equipment Co. of Detroit.

Parker to Place Michelin Ads.

Burton Parker has "signed up" as advertising manager of the Michelin Tire Co. For several years he occupied a similar post in the Fisk Rubber Co.

The Week's Incorporations.

Nashua, N. H.—Pollard Auto Co., under New Hampshire laws, with $5,000 capital. Corporators not named.

Wilmington, Del.—Phoenix Auto Works, under Delaware laws, with $25,000 capital; to manufacture automobiles.

Fort Worth, Texas—Maxwell Fort Worth Auto Co., under Texas laws, with $5,000 capital. Corporators—J. Blankenhedges, J. D. Hadley, and Anson T. Feagin.

Camden, N. J.—Direct Motor-Drive Mfg. Co., under New Jersey laws, with $100,000 capital. Corporators—Lewis Ryan, Walter O. Foss and William Phillips, Jr.

Milwaukee, Wis.—Auto Specialty Mfg. Co., under Wisconsin laws, with $25,000 capital. Corporators—F. E. Foster, Chas. E. Hughson, and Henry Cummings.

Wilmington, Del.—Phoenix Auto Works, Inc., under Delaware laws, with $25,000 capital. Corporators—R. Lopton, G. C. Maris, G. B. Lewis, Wilmington, Del.

Rochester, N. Y.—University Automobile Co., under New York laws, with $15,000 capital. Corporators—Edward G. White, Victor L. Craft, A. Vernon Hart, directors.

Bayonne, N. J.—Automobile Exchange, under New Jersey laws, with $100,000 capital. Corporators—Edward D. Cronin, Frederick Knowlton, and E. A. Monfort.

Boston, Mass.—Jamaica Plain Automobile Co., under Massachusetts laws, with a capital of $5,000. Corporators—James H. McClellan, Issacher M. Burdett, Lewis F. Clark.

Rochester, N. Y.—Frederick A. Mabbett Co., (automobiles), under New York laws, with $40,000 capital. Corporators—Fred A. Mabbett, Joseph W. Pressey and Raymond M. Bettys, Rochester, N. Y., directors.

Elmira, N. Y.—Morrow Mfg. Co., under New York laws, with $5,000 capital, to manufacture automobile and bicycle parts, machine tools, machine parts, etc. Corporators—A. P. Morrow, J. Morrow, S. C. Morrow, Elmira, N. Y.

New York City, N. Y.—F. B. Stearns Co., automobiles, under New York laws, with $5,000 capital. Corporators—George E. Daniels, Madison, N. J.; David C. Watts, 125 East Fifty-seventh street, and William F. Wilbour, 161 Madison avenue, New York City, N. Y., directors.

New York City, N. Y.—Harry Curtis Auto Co., under New York laws, with $10,000 capital. Corporators—Amanda Curtis, 309 West 111th street; Harry S. Rogers, 430 West 122d street, and Joseph S. Brown, 66 West Forty-third street, New York City, N. Y.

New York City, N. Y.—New England Auto Top Co., under New York laws, with $12,000 capital. Corporators—Guy A. Mackay, 212 West 108th street; George L. Wilson, 145 East Fifty-sixth street, and Benjamin Eisenstein, 322 East Eighth street, New York City, N. Y., directors.

METZGER'S VIEWS OF CONDITIONS

Detroiter Lets Fall Some Stimulating Opinions and Points Out the Logic of the Situation.

Of course, W. E. Metzger, sales manager, and more, of the Cadillac Motor Car Co., is in New York this week. Wherever there are shows or meetings or doings of importance, there it is safe to say Metzger will be found, and in demand. He is fruitful of ideas, is clear headed and far seeing, and these are qualities that have made his opinions and counsel of value and worth the seeking. Of course he has opinions of conditions as they exist and as they are likely to exist. They are opinions that would put heart into the drooping spirit and cause it to take on new life. Because the automobile industry may have felt the influence of the financial unrest that has prevailed and because it may have become overdone by a comparatively few speculative manufacturers is not reason why the legitimate manufacturer should take alarm or be perturbed, is the Metzger opinion expressed with characteristic earnestness.

"Does any one suppose that there are any lines of industry that has not to some degree felt the effects of the financial disturbance?" he asked. "If you make inquiry regarding even such a staple and firmly rooted business as the dry goods business, it is safe to say that it will be found to have felt the influence. There have been failure in the dry goods trade every year for very many years, but the business goes on and will go on just the same and the legitimate manufacturers and dealers will continue to exist. Too many people, even some of those in our business, do not fully appreciate the position of the industry. Why," continued Metzger, warming to his words, "it is estimated that there are 118,000 automobiles in use in this country. This number represents what? The product of just about six years. Each of these six years has been a good year. It has shown a big increase over the business of the previous year. This year, 1907, is not an exception. It also shows a good growth. The percentage of increase may not have been as large as other years, but it has been an increase and a good one; the falling off has been more imaginary than real and it is very easily accounted for. Of course, there have been failures in this business exactly as there have been failures in other businesses. But not a few of the manufacturers who failed would have failed any way, it matters not if there had been no financial unrest or how good the demand might have been. Disturbances of that sort should cause no fear to the legitimate and conservative manufacturer. This is a big country and no one can make me believe that with a population of eighty odd millions, an output of 118,000 or 120,000 motor cars spread over a period of six years, or less than six, will cause stagnation. I believe the position of the legitimate manufacturer will, if anything, be more firmly fixed and I will not be surprised if instead of 120,000 cars in six years, there is not a sale for 500,000 of them within the next five years.

"And look at the prospect for the commercial car. It has been but little more than scratched. I have had good opportunities for witnessing the results of two factories that have been devoted solely to the production of commercial cars. These results have been positively inspiring and point to a future that simply must exist. I believe that the average merchant now is about convinced not only of the superiority of motor vehicles for business purpose—that scarcely admits of argument—but of their reliability and economy, as well. I believe that by 1909, certainly by 1910, we will see a tide set in for commercial cars that simply can't be stemmed. Why has it been so long coming? Because, in the first place, the demand for pleasure cars has kept us all busy and, in the second, because the development and demonstration of commercial vehicles would entail just about double the capital. It costs not merely about twice as much to build and develop them, but it costs as much more to demonstrate them as they must be and should be demonstrated to satisfy the hard-headed business man.

"But it's a good thing for every one that the demand for pleasure cars came first and has so greatly preponderated. The men who will buy commercials are the men who have been using pleasure cars and this use has served to show them how gradually and how greatly the gasolene motor has been perfected. Many of them used the cars of earlier years and suffered accordingly. If they had suffered such expensive troubles with business wagons, they would have cast them out forever more, and the growth of the commercial vehicle industry would have been stunted or killed before it had fairly begun. But in the pursuit of pleasure, it is different. Perhaps there has been a suggestion of sportiness in automobiling and when a man is in pursuit of pleasure or sport, he will endure many things which he would not suffer for a moment in business. This sort of man has continued to use motor cars until to-day, he simply must know that in the right hands and given the right treatment, they are as reliable as a horse and will do work and far more of it and more cheaply than any horse that ever was foaled.

"Yes, sir," broke off Metzger, " I repeat that if the speculators and promoters and stock jobbers in the business have found cause for apprehension, there is no real reason for uneasiness on the part of the legitimate manufacturer. The past has proven all right and there's nothing the matter with the future."

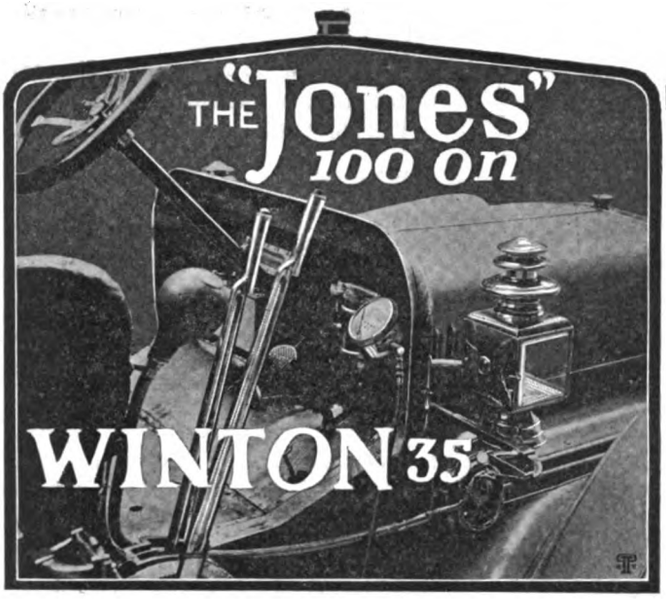
OLD HANDS REMAIN AT THE HELM

Accessory Association Makes Few Changes in Official Slate—Definitely Decides to Establish Permanent Office.

Excepting in the case of one of the vice-presidencies, no change was made in the official personnel of the Motor and Accessory Manufacturers, Inc., at their annual meeting in Hotel Astor, New York, yester-6th inst., the officers chosen by the directors being as follows: H. S. White, president; H. E. Raymond, first vice-president; H. T. Dunn, second vice-president; F. E. Castle, third vice-president; W. S. Gorton, treasurer; P. S. Steenstrup, secretary.

Immediately preceding this action by the directors, the annual general meeting of the members occurred in the same place. The revised constitution and by-laws having come into effect, directors were for the first time elected on the new basis, the result of the vote being as follows: Directors for three year terms: W. S. Gorton, Standard Welding Co.; H. S. White, Shelby Steel Tube Co.; P. S. Steenstrup, Hyatt Roller Bearing Co.; H. E. Raymond, The B. F. Goodrich Co. For two years: C. E. Whitney, The Whitney Mfg Co.; D. J. Post, Veeder Mfg. Co.; C. T. Byrne, Byrne, Kingston & Co.; W. H. Chapin, Brown-Lipe Co. For one year: E. S. Fretz, Light Mfg. & Fdy. Co.; H. T. Dunn, Fisk Rubber Co.; F. E. Castle, Gray & Davis; L. M. Wainwright, Diamond Chain & Mfg. Co.

A membership of 192 was reported and it was definitely decided to establish permanent headquarters. The treasurer's report disclosed that the organization's strong box is well filled.



Schaaf Resigns Pope-Toledo Management.

Albert E. Schaaf, manager of the Pope-Toledo factory, has resigned that office and temporarily, at least, the position will be filled by Harold Pope. The plant in Toledo probably will be shut down for a couple of weeks, but the Pope people want it known that neither Mr. Schaaf's resignation nor the shut-down indicates any lessening of energy or determination to keep the famous car to the fore. It is such a valuable asset that when certain changes are effected in the plant, it will be restarted with undiminished force and its product will be pushed with no lack of aggressiveness.

Napier Suffers Another Fire.

Fire starting in the stock and tool room of the Napier Motor Company's plant, Jamaica Plains, Mass., Thursday last, 31st ult., caused a loss of probably $50,000, the greatest loss being to the stock. This is the second bad fire which the Napier Motor Co. has had. Several years ago there was one in the same plant which caused a loss of $125,000.

On All the Best Cars You Will Find the Jones Speedometer

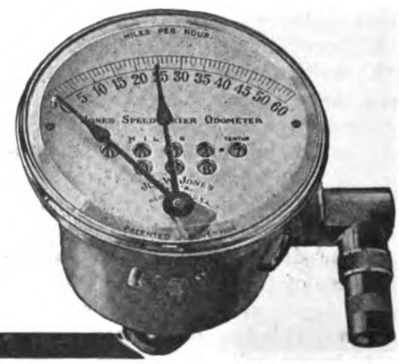
and here's a reason or two:

The Jones is the **pioneer** speed indicator.

The Jones is the accepted **standard** speed indicator.

The Jones is used in this country and abroad by Police Departments as a means for timing motor vehicles for reason of its **accuracy.**

The Jones won the Gold Medal **Reliability** Award in the Royal Automobile Club's Contest. All American and foreign manufactured speed indicators sufficiently practical to enter were in this contest.



S. F. Edge had the Jones on his Napier cars when he made the world's most remarkable record, traveling 1,588 miles 1,310 yards in 24 hours, averaging 66 miles per hour, on the Brooklands Track, London, England.

The Speedometer cable revolutions per hour, at a 66 mile speed, total 168,300 or 4,039,200 in 24 hours, demonstrating the Jones **"staying"** qualities.

Do not buy a 1908 Speed Indicator without a Maximum Speed Hand and Instantaneous Resetting Trip Odometer. These features are POSITIVE NECESSITIES. They are exclusive with the Jones Speedometer and are included on all Jones standard instruments without extra charge.

JONES SPEEDOMETER
76th Street and Broadway
New York

We will send you upon request without charge a catalog and Speedometer Bulletin. Write Dept. No. 20.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, NOVEMBER 7, 1907

The Show as a Stimulant.

It is doubtful if the tonic effects of an industrial display ever were better illustrated than by the Madison Square Garden show which now is occupying the boards.

There is no disguising the facts that the semi-panic of last week and the week before made its discomfiting influence felt at the Grand Central Palace show and that when it ended there were some sighs of temporary relief of a peculiar sort. If, between Thursday night when the Palace closed and Saturday, when the Garden opened, there was not something akin to a blue Friday, it was because the expressions of many belied them.

This feeling was pretty well dissipated before the Garden show was 48 hours old. It was a recovery of spirit so remarkable as to prove rightful cause for remark. The Garden show was one of those things that occurred at exactly the right time in exactly the right way, and perhaps in exactly the right place.

Its good effects will be represented not merely by the volume of sales, but by the renewed faith and spirit with which it infused a large part of the industry and the good influence will be imparted to and shared by even those who were not of the exhibitors.

As a cure for the "blues" the Garden show is an emphatic success and is worth all and more than it may cost.

Less Polish; Greater Utility.

One of the gratifying, though not altogether unexpected new features of detail that have become markedly apparent is the use of blued steel trimmings and black nickel lamps in place of the all too prevalent brass work of former years. In one or two instances, it appears that makers are prepared to equip all their cars in this fashion, while in others one or two machines are so mounted in what seems to be a more or less tentative manner. However, that may be, the fact that several of the lamp and fiitting makers are listing 1908 lines in which the dull oxide finish is a feature, is proof that a real movement in this direction has commenced.

Agitation in favor of such a development has not been lacking for some little time. As has been pointed out in these columns repeatedly, the lustrous finish, while ornamental and even beautiful when not carried to a foolish extreme, is in the nature of a needless luxury. More than that, the accepted fact that it is difficult to keep in proper condition, is of far less importance than the danger of disaster which it involves through risk of temporarily blinding the driver by its reflection of light into his eyes.

The dull finish, whatever its ornamental value, at all events always looks the same, regardless of weather conditions or a large or small amount of care bestowed upon it in the way of cleaning. This is its chief advantage. Another point worth considering in the same connection, is that its use affords the maker a greater latitude in the choice of metals, permits the lightening of weight, increasing of strength, or reduction of original cost, practically regardless of the exterior surface to be obtained in the finished part. The almost exclusive use of brass for this purpose thus may be eliminated, plating done away with, and by the use of the proper reagents, the final colors may be graded to suit a wide range of taste and to harmonize with an astonishingly great number of color schemes.

The Eight Suggestions of the A. A. A.

Perhaps it is possible to conduct racing on the lines drawn by the eight suggestions discussed by the A. A. A. racing board and its invited trade guests, and which are printed in another column, but it well may be doubted. It is well to surround the sport with every possible safeguard, but from practically no safeguard to an almost impenetrable hedge of them is an almost about-face which the A. A. A. seems in a fair way of executing.

The suggestions read for all the world as if only the large club, the professional promoter and the big car were in mind. Scores of races have been held in country places where clubs are impossible and where nominations six weeks previous to a race are beyond the realm of practicability and yet so far as known, such events have not been attended by accident and undoubtedly they have served to spread the gospel of the automobile and to stimualte its use. To say that promoters of such affairs, say, in Kansas, or Nebraska, or Mississippi, shall first find a club to stand sponsor for them, then hire a photographer, and an expert on curves, angles and fences, and pay a big fee for their services and for the sanction, is equivalent to either snuffing out such helpful events or to encourage "outlaw" racing, that is, disregard of the A. A. A. and its rules. It is to be observed that in practically all such races, small cars are the rule, which may account for their freedom from accident. The A. A. A. has made a praiseworthy move in suggesting a limit of horsepower, but it practically is a foregone conclusion that the limit will be based on big car practice.

It certainly is courteous on the part of the A. A. A. to ask others how it shall conduct the sport, but once more it is respectfully suggested that the mission of a governing body is to govern. Why the A. A. A. did not invite the tire makers into the conference, or provide for an inspector of tires or at least for a definite method of securing tires to the rim, is an open question. Burst tires are said to have caused very many of the tragedies, and though it sounds impractical, the suggestion of an official inspector or an official or supplementary form of tire fastening is not worse than some of the suggestions laid down.

PROBABLE DOOM OF TRACK RACING

Sanctions Will Come High if Granted at All—Suggestions Considered by A. A. A. and Conferees.

If the suggestion for the granting of sanctions for track racing by the racing board of the American Automobile Association, as advanced at a meeting of a special committee, held at the offices of the association Wednesday of last week, are carried out literally, there will be little or no track racing in this country. The meeting was called to consider the advisability of the American Automobile Association withholding sanctions for meets on tracks originally built for horse racing, and the outcome was that definite action be deferred until the various suggestions made should have been referred to the organization represented at the meeting and passed upon by them. W. H. Hotchkiss, president of the American Automobile Association, presided at the meeting, and the others in attendance were Jefferson De Mont Thompson, chairman of the American Automobile Association racing board; Benjamin Briscoe, American Motor Car Manufacturers' Association; Samuel A. Miles, National Association of Automobile Manufacturers, and Percy Owen, Importers' Salon. Ira J. Cobe, Chicago A. C., and Charles Clifton, Association Licensed Automobile Manufacturers, who also were appointed on the committee, were absent.

The discussion resulted in the drafting of a tentative set of rules to govern the racing board in granting sanctions, to be passed upon by all the organizations interested, before definite action is taken. If the suggestions literally are carried out it will place sanction fees so high as to be out of reach of a majority of promoters. It was the sense of the committee that a limit of horsepower, as advocated by the Motor World, to be fixed by formula, be adopted.

The suggestions are that the racing board of the American Automobile Association grant sanctions for speed contests on tracks not specially built for the purpose, only on certain terms, viz.:

1. That the application be made through or by a club or organization which is a member of such association.
2. That such application be so made at least six weeks before the date set for the contest; provided, that in case a sanction has been granted for a contest on such track prior to the date of such application, and after the investigation and under the conditions here outlined, such second or other application could be made within a shorter time before the date set for the contest.
3. That such application be accompanied by a photograph or photographs, showing the turns of such track, and the location of the grandstands and public enclosures thereon, and also by an accurate drawing and specifications of the track, fences and structures adjacent.
4. That such application be also accompanied by a certificate of such club or organization, that it has examined such track and the fences and buildings adjacent, and that, in its opinion, the contest or contests for which sanction is asked, can be held thereon with reasonable safety to spectators and participants, which certificate must contain an agreement upon the part of such club or association that the public will be limited to certain portions of such buildings or grounds—specifying them—and excluded from all other portions.
5. That such application include the nomination of a person or persons, whom, or from whom, the racing board may appoint a referee, who, at such contests, shall be the official representative of such board and charged with the duty of compelling the observance of all stipulations specified in such sanction and application, as well as the rules of the racing board, in particular as to the competency of drivers and the mechanical condition of cars.
6. That sanctions on such applications be granted by the racing board only after an investigation of the track, fences, buildings and adjacent grounds, to be made by such board or member of it or a competent engineer appointed by it for that purpose.
7. That all sanctions granted by the racing board specify: (a) the number of cars which may take part in any heat, and (b) the upward limit of the horsepower of such cars, the same to be fixed by a formula to be subsequently announced, as to which limit of horsepower and as to which formula the committee requests the advice of the various organizations represented.
8. That applications for sanctions be accompanied by a sufficient fee, to be fixed by the racing board, to cover all its expenses in connection with the examination of the track and its surroundings, as well as the reasonable expenses and compensation of any referee whom it may appoint as its representative.

Those at the meeting agreed that the above suggestions be submitted to the various organizations represented in the near future, and after such submission the committee would be called together by its chairman and definite action taken. As a part of the proceedings a report was presented summarizing the vote of the clubs in the American Automobile Association which have thus far taken action for or against the granting of future sanctions on horse tracks as now constructed, although it was admitted that most of the clubs voting favored the continuance of racing on suitable tracks or under suitable restrictions or supervision, so that the result of the vote really is not to be accepted at its face value, which is as follows:

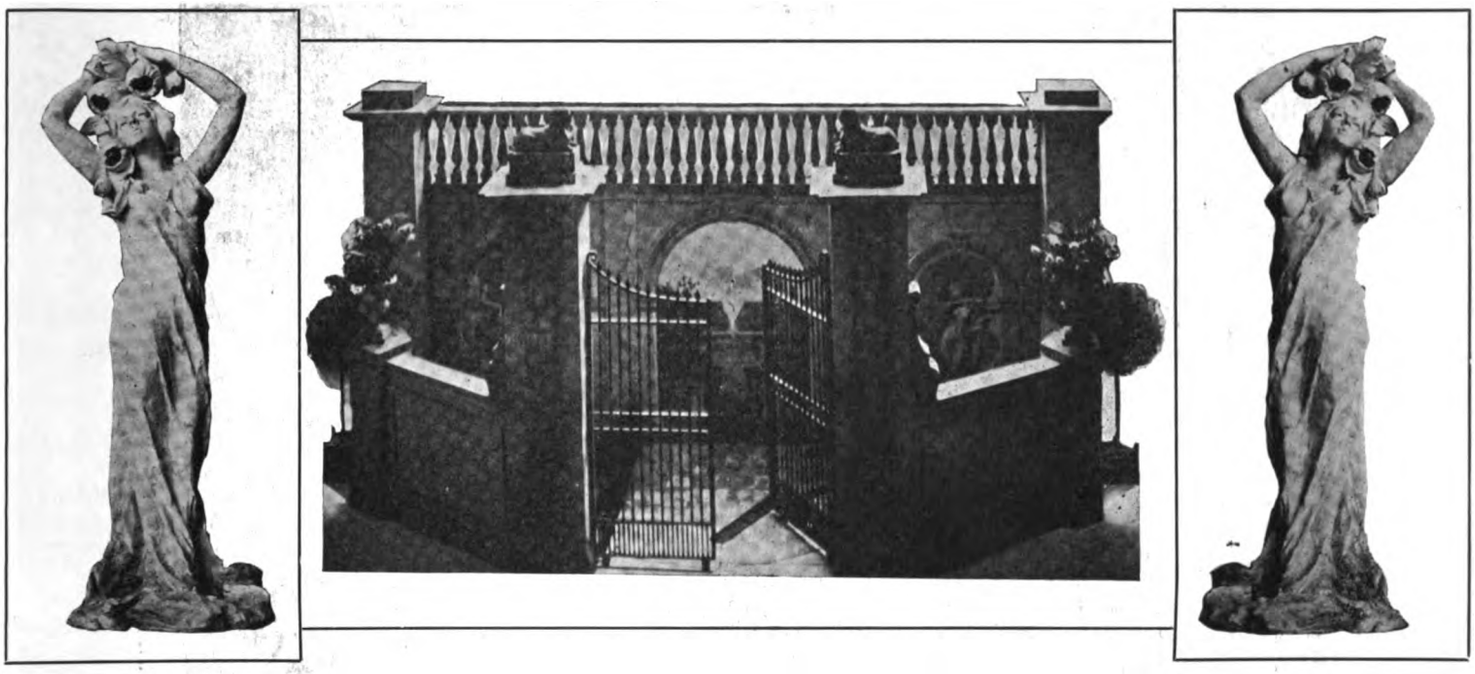
In favor of such sanctions unqualifiedly—Milwaukee Automobile Club, Motor Car Racing Association of Baltimore, Automobile Club of Kansas City.

In favor of such sanctions, but with certain restrictions—Chicago Automobile Club, Bay State Automobile Association, Quaker City Motor Club of Philadelphia.

Against such sanctions—Automobile Club of Cincinnati; Massachusetts Automobile Club; Automobile Club of Pittsburg; Rhode Island Automobile Club; Rochester Auto-Island Automobile Club, Rochester Automobile Club; Automobile Club of Buffalo; Cleveland Automobile Club; Wilkesbarre Automobile Club; Albany Automobile Club; Wilkinsburg, Pa., Automobile Club; Springfield, Ohio, Automobile Club; Automobile Club of Detroit; Brockton, Mass., Automobile Club; Automobile Club, Cass County, Ind.; Automobile Club of Central Pennsylvania; Janesville, Wis., Automobile Club; Automobile Club of Auburn, N. Y.; Grand Rapids, Mich., Automobile Club; Automobile Club of Schenectady, N. Y.; Worcester Automobile Club; Long Island Automobile Club; Weld County, Col.; Automobile Club of St. Louis; Owatonna, Minn., Automobile Club; New Jersey Automobile and Motor Club; Lima, Ohio, Automobile Club, and the Peoria, Ill., Automobile Club.

Against such sanctions in the opinion of the club secretaries, but no official action yet taken—Oswego, N. Y., Automobile Club; Springfield, Ill., Automobile Club; Bloomington, Ill., Automobile Club.

"Legal Speed Limit Run" in Rain.



Driving through a rainstorm that at times was blowing and served to make the roads slippery, eight automobiles contended in the annual cross country run of the Automobile Club of Philadelphia, on Saturday, 2d inst. The run, designated the "legal speed limit run," was for the Brazier challenge cup. Under the sules of the contest the speed maintained was to be the maximum permitted under the States laws and by the regulations of the cities and towns through which the course lay. Every minute ahead or behind time at the checking stations, which were unknown to the contestants, constituted a point against the car gaining or losing the time.

Two pilot cars started from the Manufacturers' Club, Philadelphia, at 7.30 a. m., laying out a course through Paoli, West Chester, Pheonixville, Jeffersonville, and Centre Square, scattering confetti on the way. G. B. Fletcher, 30 Packard, was the first starter, at 8 o'clock, and was followed at two-minute intervals by Henry P. Bailey, 40 Winton; Ewing L. Miler, 30 Packard; H. Morris, 35 Stoddard-Dayton; Dr. W. A. Phreaner, 40 Winton; C. Yarnell Abbott, 35 Pennsylvania; Allan Wood, 35 Ford, and C. J. Swain, Apperson "Jack Rabbit." The course measured 88.6 miles, and the running time allowed was 5 hours 19½ minutes. Swain won with a penalization of 14.5 points, Wood being second, with 15.5 points.

Governor Floyd Advocates Boulevard.

Governor Charles H. Floyd, of New Hampshire, who was the principal guest at a special meeting of a section of the State Grange at Plymouth on October 24, discussed the matter of State roads and said he was in favor of the next legislature passing a bill for the appropriation of $300,000 to build three boulevards—one in the Connecticut valley, one in the Merrimac valley, and one on the east side of the State.

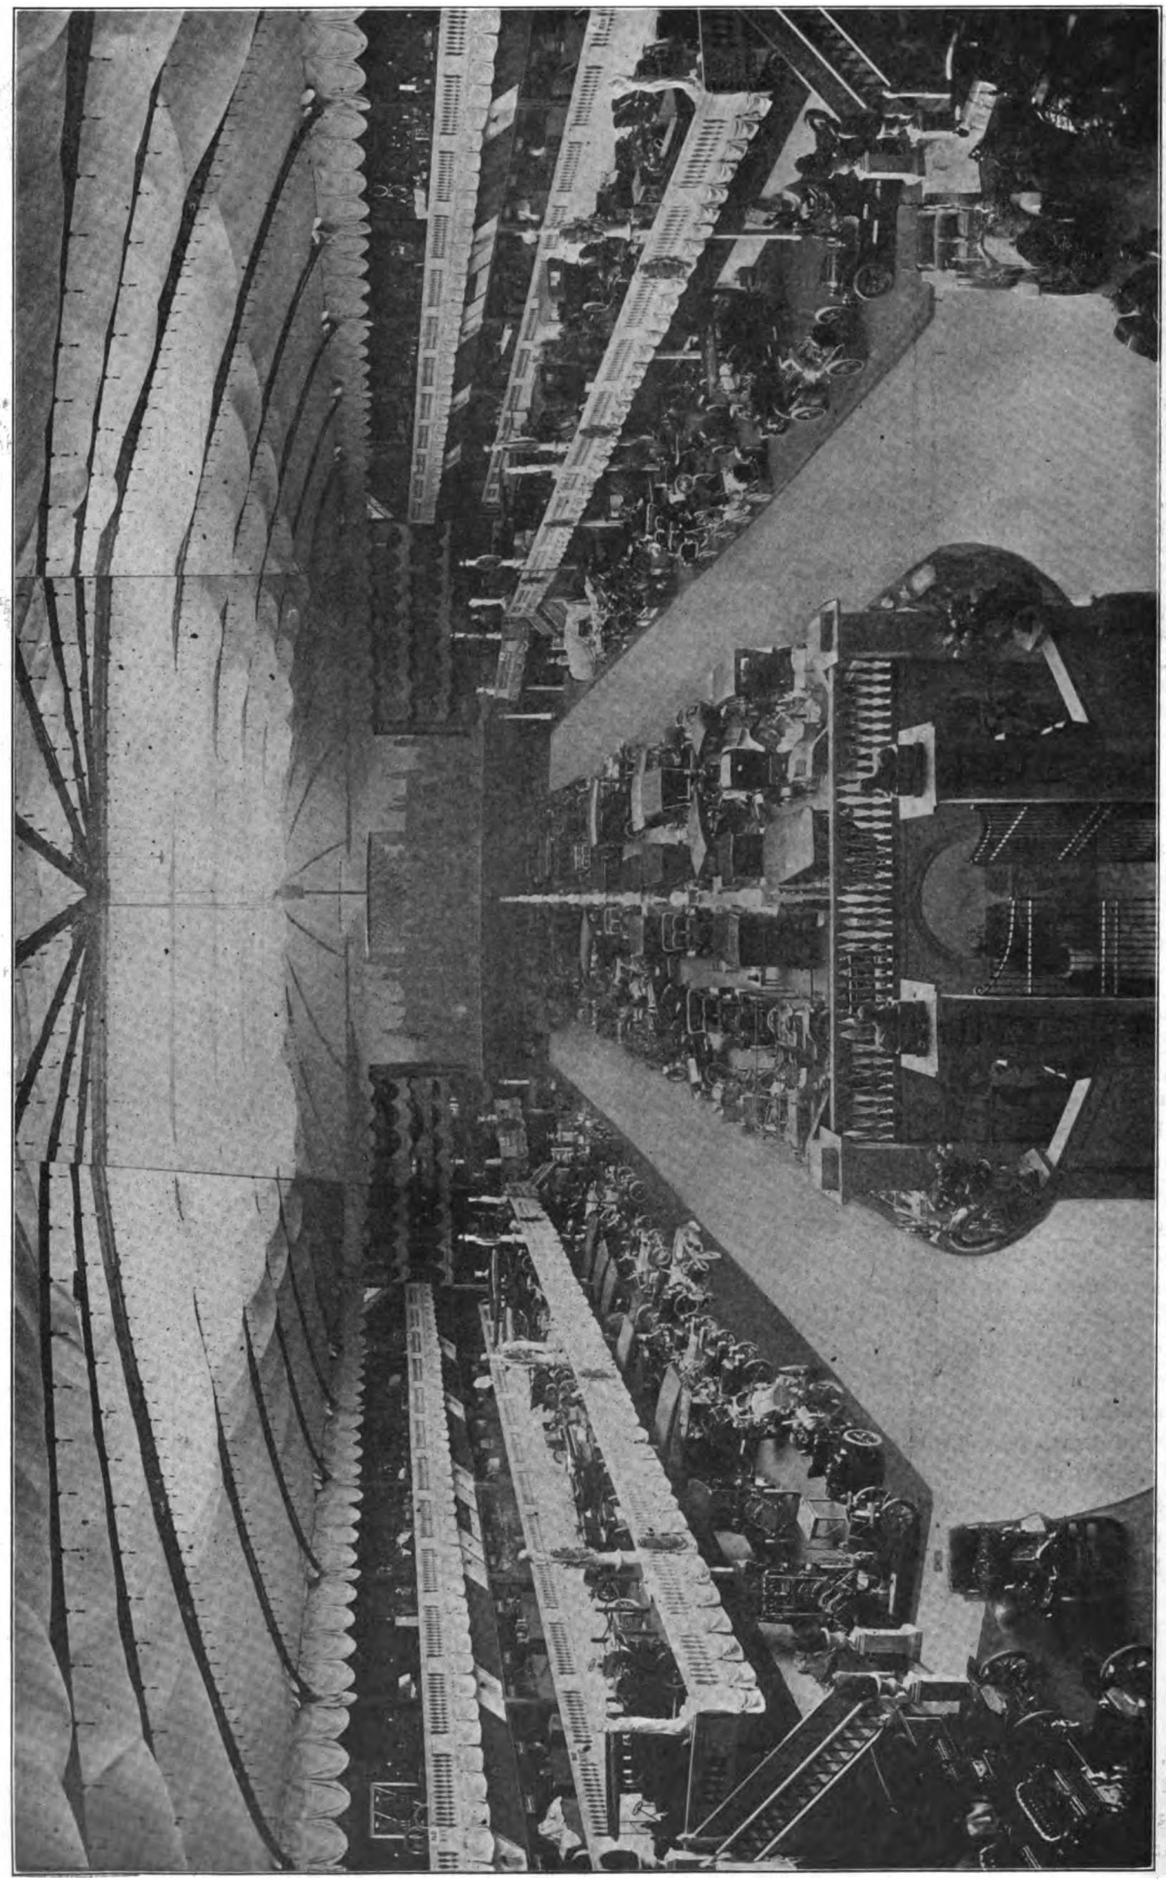
The Garden Show, Its Exhibits and Its Influence

Probably one show in New York would prove better than two, but let it be said that for once the automobile industry has been well served by the "double bill," which has been presented during the past few years.

If it were not for the show which opened in Madison Square Garden on Saturday last, 2d inst., and which will continue until Saturday evening next, a very large part of the trade would have had a very pronounced case of the "blues." Not even desire to make it, will permit of the statement that the results of the earlier show, the one held in Grand Central Palace the week previous, were of the sort to promote an excess of enthusiasm or contentment.



Perhaps the long period of financial unrest which climaxed in semi-panic during the week had something to do with the lessened attendance and dearth of and interest of sales which marked the Palace show, but whatever the cause, disappointment was the portion of very many of those who exhibited there. Most of the better known manufacturers of cars are not included in this category. They had come to the Palace with their 1908 outputs either practically sold or over-sold, and their presence was largely due to sentiment of the "rally 'round the flag, boys," kind. But to the new makers and to those who depended on the show to fill their order books the harvest was meagre, indeed. The accessory manufacturers, who, as is always the case, comprised an overwhelming majority of the exhibitors, were outspoken in their disappointment. They made no effort to conceal it. Hope for better things at the show in Madison Square Garden was the circumstance which served to keep their faces from falling lower. And for once hope was not misplaced.

When the show opened Saturday evening a howling storm of wind and rain prevailed. It was not the sort of weather to tempt people out of doors, but for all of that the attendance was unexpectedly large. And once within the big building, Chairman George Pope and his fellows of the Association of Licensed Automobile Manufacturers' show committee, had performed their work so well that it was easy to forget the raging elements without.

As was the case at the A. L. A. M. show last year, there were no Swiss guards in ruffs and helmets to catch the eye of the visitor; there were no splashing fountains or water nymphs; nor were there painted suggestions of Alpine snows or Alpine ruggedness. But chauffeurs in fancy dress, the most conspicuous feature of which was a scarlet coat, greeted the visitor as he passed the ticket-takers in the lobby. The scarlet coats constituted the first suggestion of warmth, and after passing the heroic Italian gateway, which constitutes the "frontispiece" of the show the glow of the decorative plan itself became apparent. It was not merely the glow of the thousands of electric lights, but of the deep crimson, which relieved by a soft, warm gray, formed the color scheme. The carpeting was of the same cordial hue, as were the signs on which the lettering was of gold. "Dummy" railings, delineated on cloth, circled each of the three balconies, and if one strained his imagination, he might fancy that residents in the huge painting of an Italian vila, which was employed to mask the rear walls and boxes, were looking from afar on a great amphitheatre filled with modern motor cars. If less elaborate, the whole setting is more effective than the Alpine scenery of a year ago. All is harmony, that is, all save the telharmonic music which is supposed to issue from nowhere. It is the one jarring note. It resembles the "music" ground out on a handorgan by a concealed Italian. Fortunately, there is not too much of it, and fortunately, also, a full orchestra relieves the rather doleful dirges.

Under the influence of the illumination, the warmth of decoration, the collection of magnificent cars, and of a large first-night attendance, spirits that had drooped because of previous disappointment immediately began to revive. When the show

Under the "Italian Villa" at the East End of the Garden.

closed that night, practically every one had recovered "tone" and was feeling distinctly better. On Monday the good feeling was strengthened. Throughout the day the number of dealers in attendance was gratifying and in the evening the crowd also was large and of good class. On Tuesday—"Dollar day"—and, incidentally, election day, when increased admission fee and holiday was expected to prove a combination that would considerably reduce the "gate," there was another agreeable surprise. While the crowd in the early afternoon was light, it picked up amazingly in the evening, and a practically full house resulted.

It is, of course, essentially a show of big, impressive cars, and nowhere can such cars be shown to better advantage than in Madison Square Garden. Other buildings may be as expansive, but they lack the light and the great height of dome that adds so much to the general effectiveness. The Cadillac is almost alone in the field of small, popular priced cars, but it holds its own well and, with their new bodies, which seem of higher finish than heretofore, the Cadillacs never showed to better advantage. Even the body change in the famous single cylinder Cadillac, while not extensive, has served to give it a "niftier" appearance. There is a buckboard in the show, but it is in a class apart and also is there an Autocar runabout, but it is quite overshadowed by its big brother. There are a few big little cars like certain of the Franklins, and there is a new Buick runabout at $850, which is making its debut, but, of course, it has yet to earn its spurs, so to speak. Probably the Thomas town car also comes under the head of a big little vehicle and it is not too much to say that it merits all the attention it receives. The Franklin cab was one of the unanticipated cars, which, because of its high build and unlikeness to anything else in evidence, "stands out" quite prominently. In the electric department there are of course, a number of runabouts. Practically every exhibitor has one or more, and as always and generally speaking they are of pleasing design and superb finish.

With big cars the rule and not the exception, it is difficult for any one of them to so "stand out" as to be specially distinctive, but, if apart from striking colorings, there are three cars that do so stand out, undoubtedly they are the Pope-Toledo touring coach, the Apperson touring coach and the Corbin "Comet," the latter a rather lightly built double rumble runabout which with wide sweeping mud guards fore and aft suggests a huge winged bird perched on wheels. Of cars which catch the eye and cause tongues to wag, none have caused more of the wagging than the big Packard runabout finished in lavender and gold and upholstered with white calf. It has been dubbed the "honeymoon car" and it looks the part.

Viewed with an eye to color effects the display, as a whole, is surprisingly harmonious, and while here and there a bit of vivid color may be seen there is little that suggests garishness. Something more of this quality is to be seen on more detailed inspection, but the loud colors are exceptional. A great majority of the color schemes exemplify a refined taste, even where assertive hues prevail, and in a number of instances the bright color employed loses its loudness in the service of setting off a jetty black or a very deep blue or green. Perhaps the daintiest specimen of the painter's work in the entire show is the "honeymoon car," a Packard runabout from the tires of which one might almost expect to pick out kernels of rice. The color is light lavender picked out in gold and a darker shade of lavender in stripes. The upholstering is in white enamelled calfskin.

Apart from this particular vehicle the Packard exhibit is a pleasing one in the substantial richness of finish seen on the cars, which, with this and one other exception, are finished in the standard colors of this make—dark blue body picked off with primrose, and the running gear in primrose. The other exception is a limousine body in very dark green, picked off in black. The running gear is primrose.

Of several cars finished in unusual colors one is a cape top Matheson touring car, finished in a peculiar shade of light green for which no name could be found. It is gravely stated to inquirers that a lady for whom the car is intended could not name the color in which she wanted it finished, but presented her gloves and parasols to be matched in the paint shop. The "greenery-yallery" or whatever the aesthetic hue

Digitized by Google

may be, is set off by black stripes. The car is upholstered in oak tanned pigskin.

Another Matheson production which attracts attention is a three-quarter limousine showing a beautiful natural wood finish, the finely grained panels divided by mouldings of a lighter color. The mud guards are of light colored leather. The interior is finished in woven rattan and the upholstering is in pigskin.

What many persons consider the most elegant body in the show is a Pierce Great Arrow limousine, much of the beauty of which is the interior. The upholstery and trimming are in rawhide, all the decoration being hand tooled. The decorative scheme is rich and somewhat profuse, but not beyond bounds, and in some parts there is effective use made of tiny bits of red and blue. The ceiling, with an electric lamp, in the center, is a feature in the scheme. Exteriorly the body is of dark maroon, with black sides, the hood also being black, which color appears also in stripes on the maroon. The panels are maroon, picked off with black stripes. The running gear is painted chocolate color, with black striping.

Another limousine body which repays a look inside is the Pope-Toledo touring coach. It is a striking vehicle in its outward appearance of bright yellow. The yellow is picked off with black striping, and a Victoria hood over the driver's seat serves to quiet, with its black, the noisier color. The interior finish of the body is in curly French walnut, and the upholstery is in a soft gray material. An interior electric light, sliding windows and blinds, and folding spare seats are other inside features. This car carries oxydized lamps, which, with black lamps are appearing to challenge the lamps of polished brass and nickel.

A Pope-Toledo four-seat runabout presents one of the few oddities in color. It is a peculiar light green, set off with gold stripes about a quarter-inch wide. The upholstery is leather of the tint known as ashes of roses.

An English mail coach of the old style, with an automobile hood in front of it is the form taken by one of the Apperson cars. It is a tolerably exact reproduction, and some of the well known lines in the old coach are emphasized in the color scheme of the finish, scarlet predominating. the bright color being set off by the black top and trimming. Another Apperson product staged is a touring car of pleasing body design the lines of which are lost in a perpendicular arrangement of black and red stripes, the forward portion of the body being mainly in red.

A Columbia gasolene-electric runabout, finished in a peculiar yellowish color, is one of the conundrums to visitors who are not familiar with the painting trade. Fired at attendants the conundrum elicits an answer which, as near as it can be spelled by ear is "serpentan." The attendants declared they were not joking, but they declined all invitations to spell. The color is picked off with gold stripes, and the car is upholstered in dark maroon.

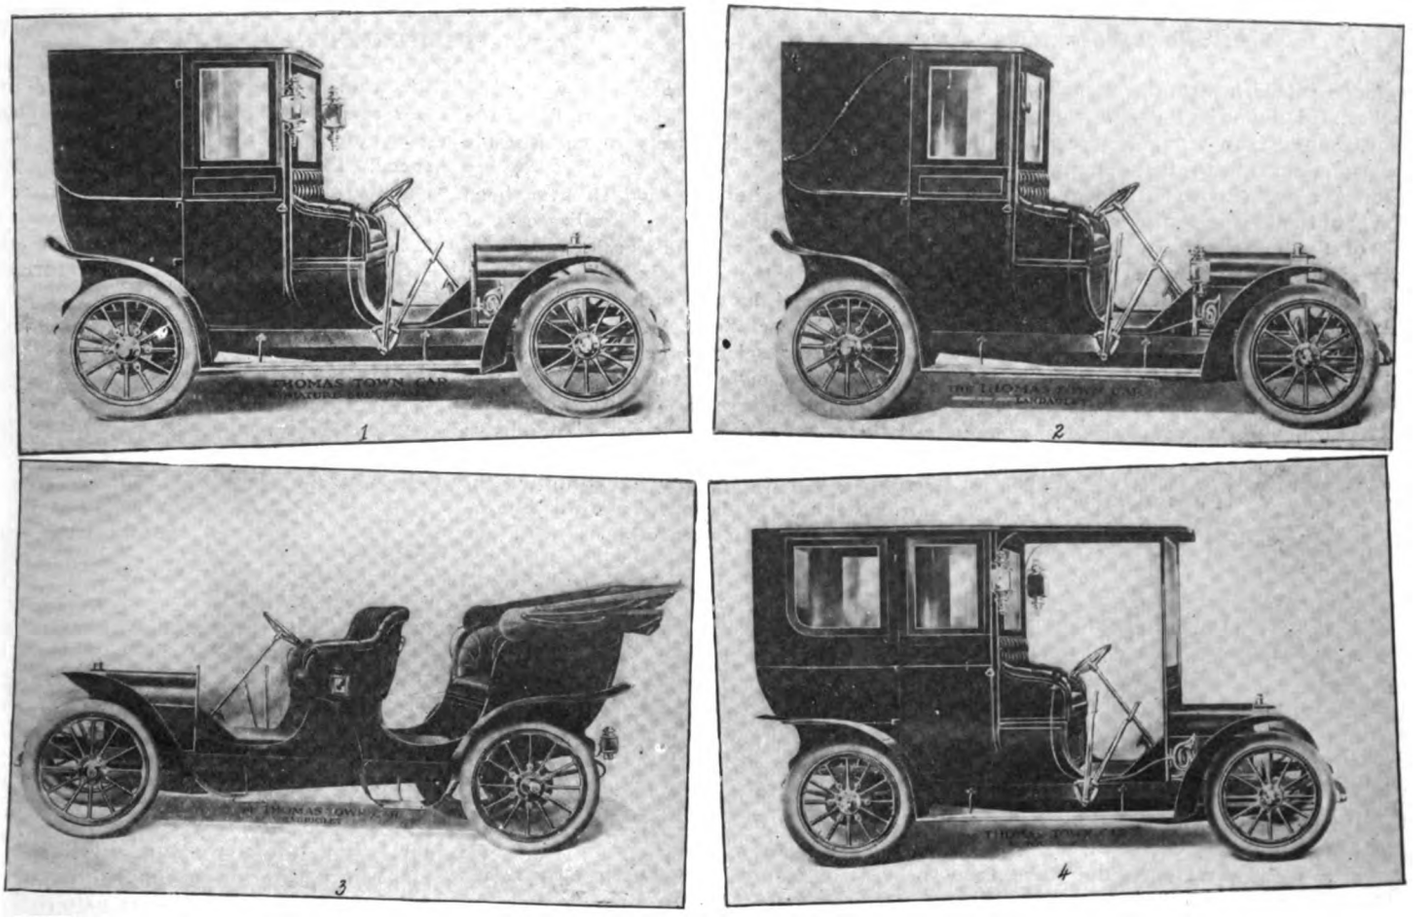
Cream yellow, striped with dark green and narrower stripes of red, make an attractive finish on a Haynes cape top touring car. The upholstery is green.

An effective display of color schemes marks the exhibit of White steamers, one of which in white is especially noteworthy. It is a runabout, finished in white, with narrow red striping and upholstered in terra cotta colored leather.

Rich tones mark the colors on the Studebaker cars, one of which, a large touring car, is a bright red. The lower part of the body and the hood are black, with broad striping of red. The running gear is red with black striping. Black leather is employed in the upholstering. Another handsome Studebaker is a runabout with a rich emerald finish on the body, black striping and red leather upholstery. The black hood has brass hinges and a brass front.

An attractive color scheme is seen on a Locomobile with a yellowish green body, lightly striped with red. The chassis and running gear are red, striped with the color seen on the body.

Among the electric cars a Baker runabout is marked by the contrast between the dark blue body, striped with primrose and the primrose running gear striped with dark blue.



It has come to be generally accepted that the internal mechanism of the car now offers small room for startling improvement. Nevertheless several features are disclosed at the show which are worthy of being singled out, while a few others are of a more significant nature. Thus the use of the concentric type of valve on the Franklin motor is absolutely revolutionary in its effect, while the Haynes double fly wheel, advanced as an "answer to the six-cylinder argument" is fraught with far-reaching possibilities. The Winton self-starting gear proved to be unique, both as to purpose as well as in general simplicity and effectiveness, while incidentally the application of the double jet principle to the "puddle type" of carburetter, the first development along this line of a type which appears to be growing in popularity, also was distinctive.

The "bloc" type motor applied to the Thomas town car line, and which is made up of but two castings, practically speaking, is another feature of moment, while the construction of the remainder of the little chassis in itself is interesting in the extreme. The Columbia gasolene-electric system, though not absolutely new at this time, having been shown last year, yet proves interesting not alone because of its continued novelty, but because of the general improvement in the system as a whole brought about by the adoption of the new and excellently designed motor.

In a still more general way, the fact that three of the former exclusive adherents of air-cooling for motors now produce in addition to their regular lines cars which are closely parallels with them, but driven by water cooled motors, serves to draw attention anew to the subject of cooling and cooling systems, and incidentally gives Franklin, as the exclusive air cooler, an opportunity to point out that the auxiliary exhaust, as employed in the Franklin mo-

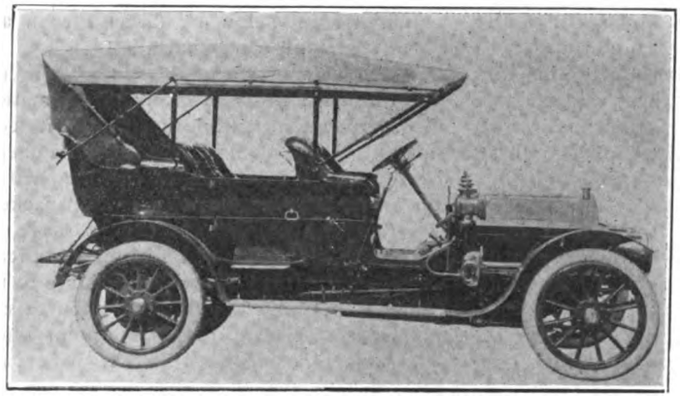
Digitized by Google

tor is one of the big secrets of the air-cooled system. An apparent growth in the use of the shaft drive, the increased use of either full elliptic or platform suspensions in place of the formerly abundant and almost exclusive semi-elliptic pattern, draws attention to this matter, while sundry improvements in another way, focus attention on the braking problem and the new ideas which have developed within a twelve-month. The fact that in one or two instances wheel bases have been decreased, or weights lightened over those of last season, are doubly significant as indicating further convergence of types, and the working out of certain notions of design to their limiting values.

Four Forms of Thomas Town Cars.

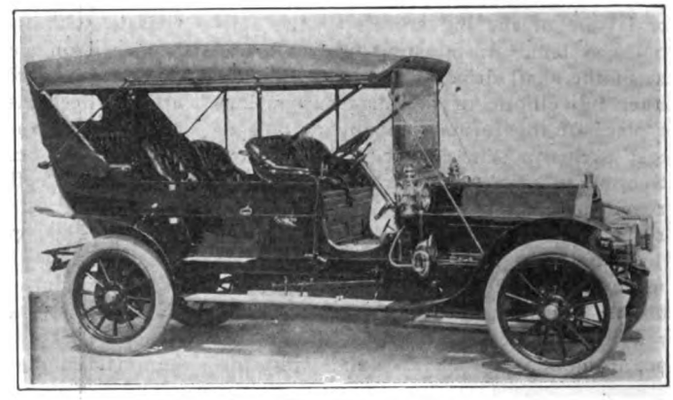
THE THOMAS CARS.

For the 1908 season the Thomas product has been so enlarged that it may now be said to embrace three distinct lines, namely, the Thomas Flyers, which are made in four-cylinder 60 horsepower and six cylinder 70 horsepower types; the Thomas-Detroit, which is a 40 horsepower machine, and the Thomas town car line, which is based upon the new and very remarkable 18-20 horsepower chassis. The first two lines have undergone some little change since last year, the six-cylinder Flyer being an innovation at the present show. The town car chassis, with its various bodies, of course is placed on view for the first time.



The specifications of the latter machine are: Wheel base, 100 inches; tire sizes, 32 by 4 inches, front and rear; transmission, selective gear change and propeller shaft; springs, semi-elliptical front, and full elliptical with scroll ends, rear; weight approximately 1,800 pounds. Its general lightness and low chassis level are noteworthy, especially since the compactness of the design permits the use of a low frame without material sacrifice of road clearance, the nominal height of the lowest point above the ground being 10 inches. The center of interest, however, is the motor, which is remarkable in the extreme.

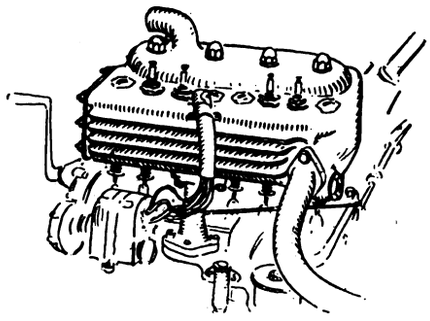
With its four cylinders cast "en bloc," and containing not simply four cylinders together with their valve chambers and ports, but also the inlet and exhaust manifolds—the latter being cooled to some extent by the use of external radiating flanges—the economy of space is simply amazing, especially considering its cylinder dimensions, which are 3¼ by 4 5-16 inches, bore and stroke. The exhaust pipe is led out at the rear end of the cylinder casting, while the inlet pipe is coupled at the center of the block, and below the overhang of the valve chambers. Both sets of valves are placed on the left side of the group and are actuated from below by direct thrust, and from the single cam shaft..



The lower portion of the motor, comprising the usual bed and crank pit formation, also performs a multiple function in its conduction of the cooling water, and housing of the carburetter mixing chamber within the water inlet port to the cylinder jackets. To this end an independent passage is cored out of the side of the crank case, leading from the front of the base casting to the junction between the third and fourth cylinders, from below. Just at the point where the joint is made between the base casting and the cylinder casting, this passage is enlarged, and is made to surround a small chamber which does duty as mixing chamber, and to which are connected the float chamber, as well as the short length of intake piping.

The crank and cam shafts run on annular ball bearings, one set mounted at either end of the base, serving in each case, these four bearings being the only ones in the entire motor. The only auxiliary, if the carburetter be accepted as integral with the motor itself, is the high tension magneto, which is driven by a spur gear from the two-to-one group at the forward end. The water connections, both to top and bottom of the radiator are very large, and circulation is by the thermo-syphon system. Fan blades

Digitized by Google



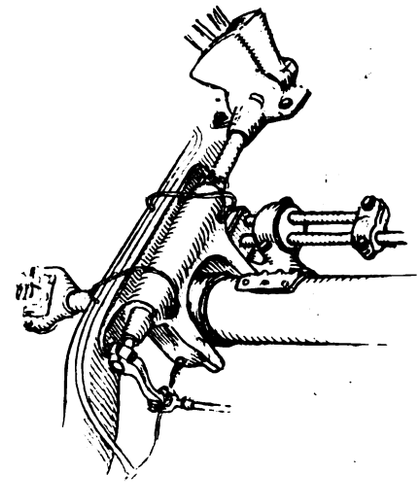
Four-Cylinder Pierce Great Arrow

Six-Cylinder Pierce Great Arrow.

are made integral with the fly wheel, this member also mounting the plain cone clutch.

The change gear group is mounted in a housing integral with the differential casing on the live rear axle, the torsion tube being unusually long, and supported just back of the clutch in a universal hanger, which also is adapted to receive the traction drag from the wheels. This important articulation, like those of the selective mechanism adjacent, is lubricated by force feed, one set of branched leads taking care

Thomas Town Car Motor.



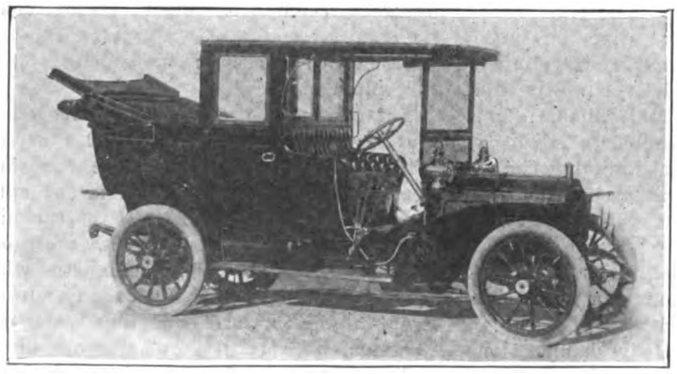
of all the bearings in the chassis which require frequent attention in this way.

The change gear affords three changes of speed with a direct drive on the high, its concentration on the rear axle, along with the brakes, making but two centres requiring attention, namely the motor in front, and the driving group in the rear. The frame is dropped from the rear axle behind, thus affording the very low normal chassis plane mentioned, and permitting the adoption of a wide variety of comfortable bodies.

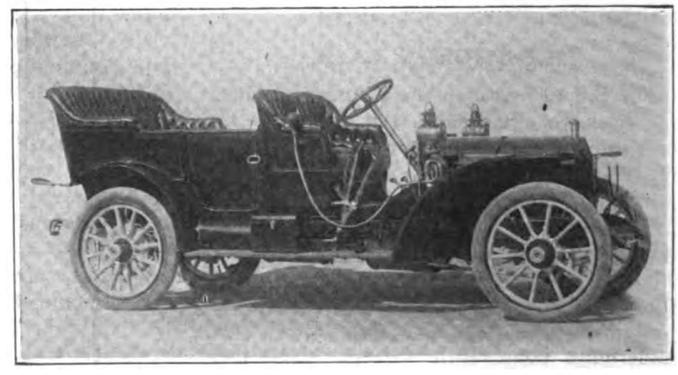
Among the alterations which have been brought about in the more familiar cars of the Thomas line, may be mentioned the development of the new six cylinder Flyer, which has 5¾ by 5¾ inch cylinders, 137-inch wheel base, 36 by 4½ by 5 inch tires, front and rear, selective gearset, giving four speeds with double bevel drive, furnishing direct connection on both third and fourth relations, and is chain driven. The alterations in the four-cylinder Flyer comprise among other things, the adoption of the straight line type of body, a new form of radiator, straight dash, and the use of a suction fan in the fly wheel in addition to that mounted back of the radiator. The wheel base is now 128 inches, as against 118 inches last year.

The Thomas-Detroit cars also have been considerably improved, a new form of motor having been adopted, which has both valves on one side, worked by direct thrust from below, and with cylinder dimensions, 5 by 4¾ inches, bore and stroke. A new carburetter is in use, which has a water-jacketed mixing chamber; while such improvements as are embodied in an increase in the size of the water pump, and the adoption of a larger and stronger fan among others, tend to increase the running efficiency of the power plant.

The wheel base now is 112½ inches, and the wheel and tire sizes are 34 by 4, front and rear alike. The selective type change gear, affords three forward changes of speed. The use of larger springs and heavier steering knuckles, makes for easier riding, and the increase in the dimensions of the tonneau by 5 inches in length and 6 inches in breadth, conduces to creature com-



Torsion Group, Thomas Car.



fort. Both the Detroit and Flyer cars are made in roadster or runabout forms as well as in the regular touring car pattern.

PIERCE GREAT ARROW.

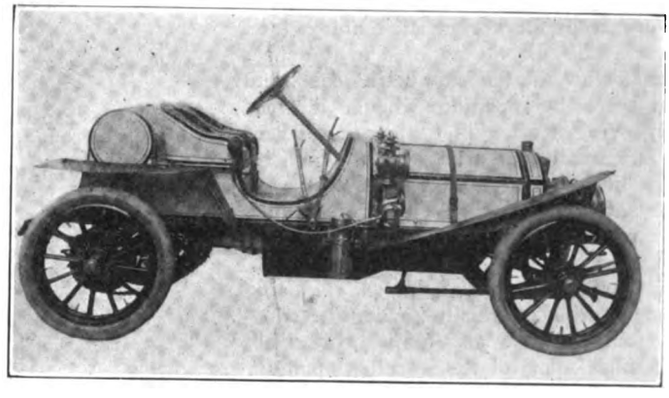
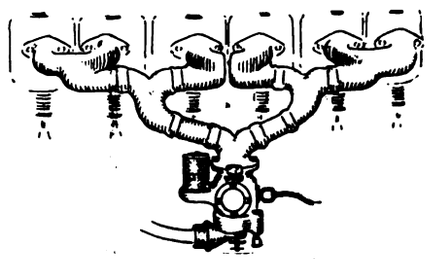
FOUR OF THE BIG RUNABOUTS AT THE SHOW.



Packard.

Studebaker.

Winton.



Apperson.

Great Arrow line, two being driven by four cylinder motors, and two by sextuple engines, one of the latter being a new model. The details of construction are very similar throughout the line, and as is the case with practically all standard cars of this type, there have been few alterations in structure, except in minor details.

Summarized, the specifications of the several types, each of which may be had either with closed or open bodies, are as follows: For the 30 horsepower, four-cylinder car, cylinders, 4¼ by 4¾ inches; wheel base, 112 inches; for the 40 horsepower four-cylinder cars, cylinders 5 by 5½ inches. wheel base, 124 inches; for the 40 horsepower six-cylinder car, cylinders 4¼ by 4¾ inches; wheel base, 130 inches; for the 60 horsepower, six-cylinder car, cylinders, 5 by 5½ inches; wheel base, 135 inches. The 6-40 type is a new model.

General features common to the line are the use of individually cast cylinders, double ignition by magneto and battery with two sets of spark plugs, oppositely disposed valves, actuated from below by direct thrust, auxiliary drives fully housed in every case, continuous flush lubrication by gravity feed from oil tank at side of cylinders to all bearings, including the crank pin journals, which are fed through ducts in the shaft. There is no sub frame, and the three-speed, direct-drive-on-high gearset is hung from cross members of the main frame. Transmission is through a leather faced cone clutch fitted with cork inserts, and by shaft to the live rear axle. The external-internal brakes on the rear wheels are equalized by beams extending the full width of the chassis and applied by center pull.

As already indicated, the alterations—refinements probably is the better word—found necessary have been few and apparently insignificant. They include, by way of illustration, the use of a new type of auxiliary air intake valve on the carburetter, which somewhat resembles in form, the reed of a common motor horn, the engine suction serving to lift the tongue in proportion

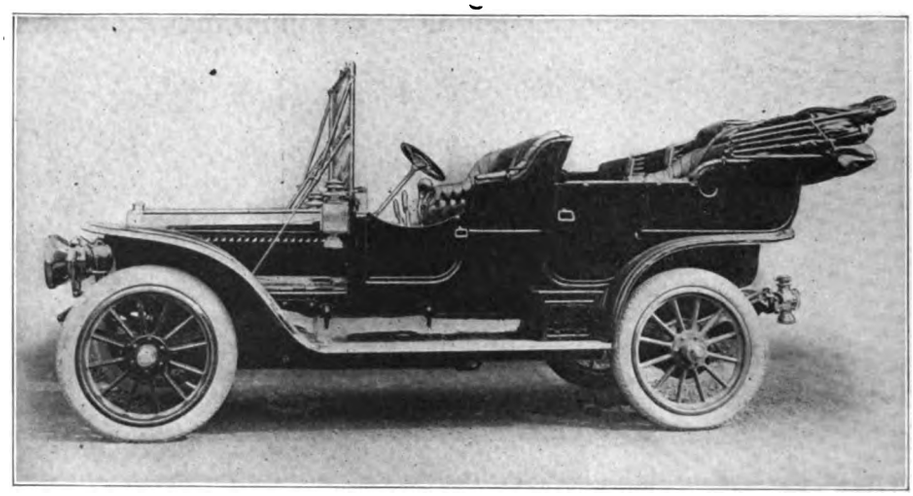
Intake Manifold, Pierce Great Arrow.

to the demand for extra air. Two of these valves are employed, one acting at medium motor speeds, and the other at high speeds. The construction is such that for all ranges of service, any tendency to whistling in the carburetter is completely overcome. A compensating adjustment on the valve lifters is another improvement of a simple but important nature, which further exemplifies the almost absurd simplicity of the alterations which are now deemed requisite from year to year.

WINTON SIX-TEEN-SIX.

As the only car exhibited by a maker devoting himself exclusively to the six cylinder product, as well as by reason of a number of unique features peculiar to itself, the Winton cars with their rather cryptic appelation, "Six-Teen-Six," were practically certain to command attention; and they have not failed to do so, and deservedly so. The Six-Teen-Six, besides being entirely new is of general and particularly interest because of the self-starting gear with which it is equipped—a feature long sought for and much to be desired.

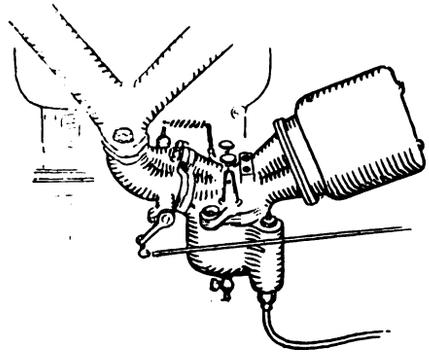
This consists of nothing more complicated than a distributing valve driven from the cam shaft and timed with it to open a port corresponding to each cylinder at the firing point only. Leads from the delivery side of the valve, which is of simple disc form, connect with the cylinders, while a supply pipe connects the valve with a storage tank under the left side of the chassis. A check valve on the forward cylinder, set to open at 90 pounds, serves to collect a small proportion of the cylinder contents during the firing stroke, and to pass them on to the tank, where a considerable volume of gas may thus be accumulated. When it is desired to start the motor, simply depressing a push-button on the dash, suffices to direct the compressed air and gas into the distributing valve which, in turn, auto-



Digitized by Google

matically selects the proper cylinder, and introduces the gas into it. The gas already compressed in the cylinder from previous running thus receives additional pressure from the supply tank, and when the full force of the tank pressure has made itself felt, the accumulated pressure becomes great enough to move the piston, when, the firing point being reached, the first ignition takes place, and from this artificial impluse the regular cycle of operation is at once instituted. The starter is always in gear and always ready for use. Its simplicity, moreover, affords it a strong recommendation.

An important point in connection with the lubricating system proves to be the means by which all surplus oil is returned from the crank pit to the supply chamber of the pressure feed oiler regularly employed on the car. The oiler is mounted in the chassis just below the left side of the dash, and in an accessible position, whence it feeds nearly every bearing in the car. Adjacent to it is a small gear driven pump which removes oil from the crank pit as fast as it accumulates, and returns it through suitable strainers, to the oiler to be used over again.



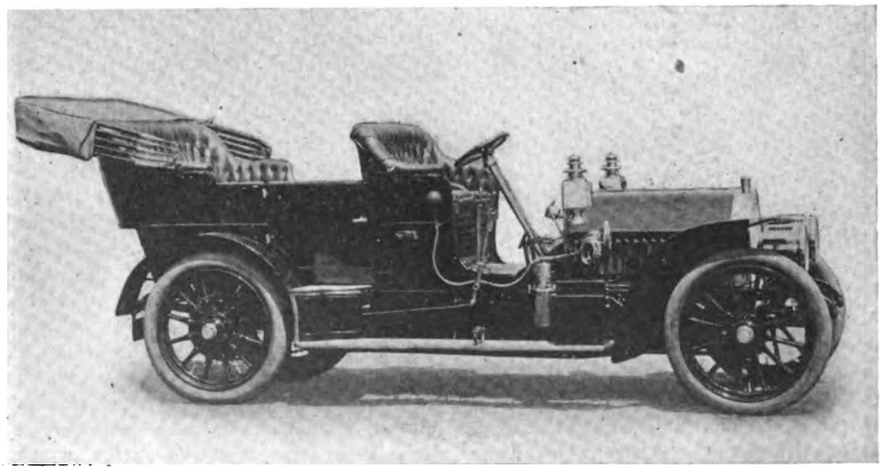
The carburetter also is unique in being provided with a muffler to deaden the whistling sound of the air intake. Like last year's model, it is of the so-called "puddle" type, in which the air supply is drawn in constant volume over a plain orifice at the base of a U-tube which is slightly submerged below the fuel level of the float chamber. This year's type, adds to the simple device thus formed, a second U-tube of smaller size and a compensating throttle arrangement whereby at low speeds and small throttle opening, the smaller tube only is in action, while for higher engine speeds the second is brought into play, the pair working together in producing the requisite mixture.

The Six-Teen-Six specifications may be be quoted briefly in this way: Cylinder dimensions, 4½ by 5 inches; 48:6 horsepower; wheel base, 120 inches; tires, and wheels,

Winton Six-Teen-Six.

36 by 4½ inches, all around; transmission by multiple disc clutch having 65 members; three-speed selective gearset, shaft drive, and floating type axle; both rear and front

Winton Carburetter.



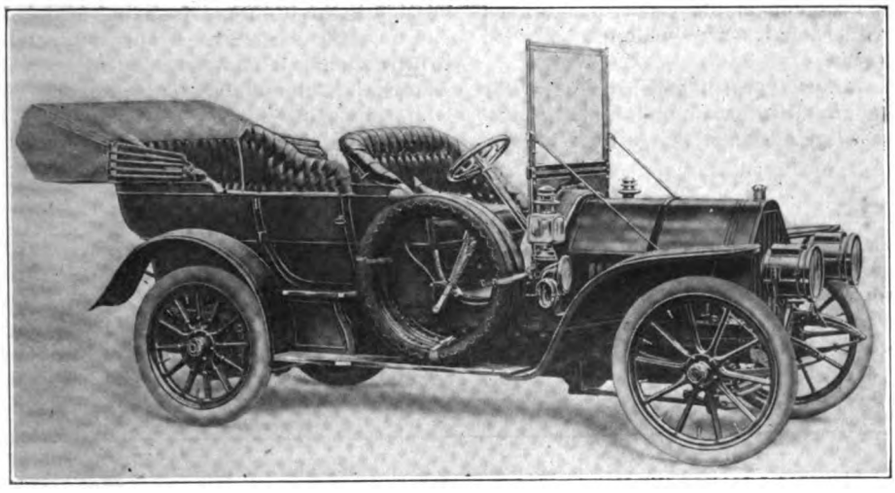
axles being mounted on Timken roller bearings.

ROYAL TOURIST.

The most striking feature in connection with the motor equipment of the Royal Tourist, is, as was the case last year, the use of double ignition, comprising the Bosch high tension magneto, and coil and accumulator, applied to a single set of plugs, the distributing arrangements being such that the coil is thrown entirely out of service when the magneto is cut in. This feature is retained absolutely without change; indeed, minor refinements only have been found possible in the whole structure of the car.

The principal points covering the structure of the vehicle in general are the wheel base, 114 inches; wheels and tires, 36 by 4½ inches, front and rear, shaft drive; three speed change gear system. The motor, which is rated at 45 horsepower, measures 5 by 5½ inches, bore and stroke, has cylinders cast in pairs, with integral jackets, centrifugal pump, cam and magneto gears fully housed, and interchangeable valves arranged on opposite sides of the motor.

Of the comparatively few alterations which are to be found in the 1908 model, the adoption of the semi-platform type of spring in the rear, together with the semi-elliptic type in front, and formerly used all around, stands out most conspicuously. Besides this the tire sizes have been increased from 34 by 4 inches to their present dimensions, while slight modifications —almost too unimportant to notice, have been made in the steering gear, hubs, radius rods and general arrangement of the rear axle group.



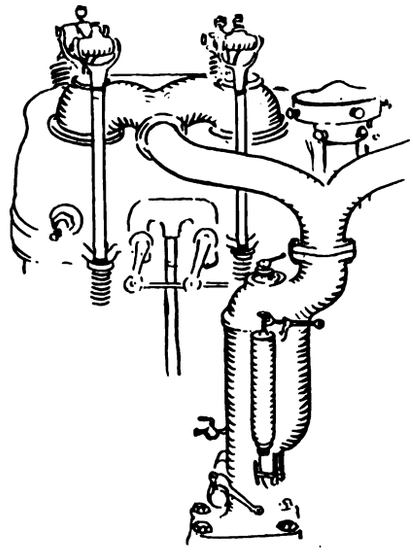
Type I Standard Locomobile.

POPE TOLEDO.

In the Pope-Toledo, than which no car is more impressive, a sufficient number of alterations have been brought about to materially alter its action in several ways. Two chassis are built at the present time, the chief distinction between them being the length of wheel base, which is 115 and 126 inches, respectively, and such difference in position of motors and steering gears as the requirements of the runabout and touring types of body demand. The bodies used are newly designed, and combine with stability of line a high degree of artistic effect.

As for the principle difference in the mechanism which distinguish the models of

Digitized by Google

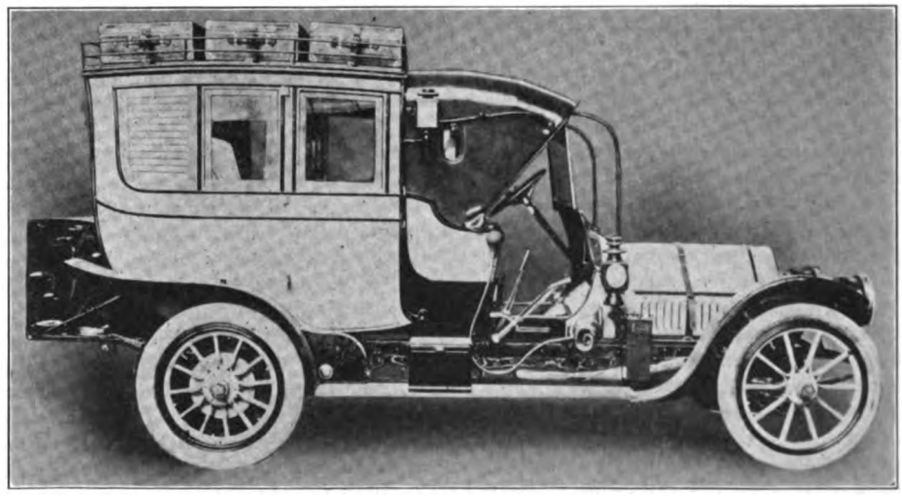


Pope-Toledo, Type XVI.

1908 and 1907, while the weight of the motor has not been increased, a number of changes have been made. Thus, while the jacket capacity has been increased, the design of the cylinder heads has been altered and simplified to lighten them somewhat. Double ignition is now fitted, the system being one of complete duplication, the Eiseman high tension magneto being supplemented by a quadruple coil, timer, battery and independent spark plugs. One of the comparatively minor refinements is the use of manifolds and drain pipes leading from the pet cocks on the cylinder walls to the pan beneath the crank case, thus leading away all oil and soot from the combustion chambers, and leaving the motor clean at all times.

A new carburetter of the concentric float, vertical pattern is employed, one of its original features being the adoption of a gas adjusting valve, regulating the quality of the mixture, and adjustable from the driver's seat by the manipulation of a small handle on the dash. The crank shaft is mounted on three annular bearings, and the entire interior of the engine is lubricated by an original and improved form of self-adjusting, constant level splash distribution. To this end, the crank base is divided laterally into two compartments, the upper forming the crank pit proper, while the lower serves as a sump and storage compartment for the reserve supply of lubricant. From the sump a small pump feeds the oil into the crank case, overflow pipes returning the surplus to the lower compartment as fast as the level rises beyond the proper point. In this way a constant level is maintained at all times, irrespective of local conditions. The splash into the lower sides of the pistons is prevented from flowing directly back into the crank pit by a flange cast inwardly upon the lower end of the shell, a small amount of oil thus being gathered and retained until distributed over the cylinder walls through several small holes drilled outwardly through the shell.

The master clutch, which has been lightened and strengthened at the same time, by the adoption of improved metals and the readjustment of the wearing surfaces, has



Pope-Toledo Carburetter.

33 discs in all, 17 of which are "dead" and turn with the engine shaft, the balance being keyed to the driven member. The change gearing, which is of the selective type, as has been the case hitherto, is mounted on five annular bearings. It is arranged to give a direct driving connection on the third speed, the fourth being geared up considerably nearer to the speed of the engine. As was the case with the previous model, the differential and countershaft group is mounted considerably to the rear of the gear case, the final drive being by double chain with the necessary reduction divided evenly between the bevels and chains. A new feature in this connection, is the use of leather chain guards, which completely protect those members from dust and dirt.

The mechanism of control comprises in addition to the motor controlling levers on the steering wheel, a foot accelerator, the unusual pair of side levers, and three pedals, one of which sets the rear wheel expanding brakes, also throwing out the clutch, the second actuating the clutch alone, while the third operates the countershaft brake, which is entirely independent of the clutch controlling device. The use of blued steel instead of polished finish in a number of parts is not the least of the noteworthy innovations.

MATHESON.

The sturdy and powerful characteristics of the Matheson car, due in part to the generally massive design of the machine, and in part to its original construction in several noteworthy points, have been further increased in the latest chassis, by the adoption of several improvements which, though few in number, are significant in detail. The specifications of this machine may be summarized thus: Bore and stroke of motor, 6 by 5 inches, the excess of bore over stroke being a Matheson asset in which no small value is placed; nominal power, 50; multiple disc clutch; change gear, selective type affording four forward speeds through a double bevel system, with direct drive to counter shaft on the fourth; double chain transmission to wheels; four brakes, one pair on

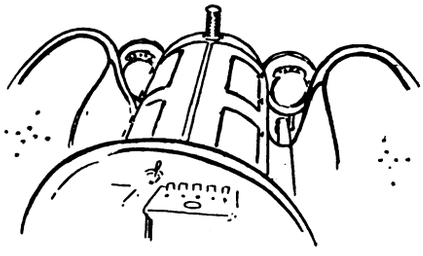
Pope-Hartford Touring Coach.

Digitized by Google

counter shaft, mounted at either end and applied by pedal, and the other expanding into drums on the rear wheels.

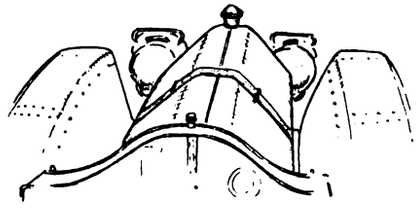
The peculiar construction of the valve and ignition mechanism which has been a feature of the car hitherto, is continued practically unchanged except that the single cam shaft is now driven through spiral gears, from a vertical, instead of an inclined shaft, the mechanism being entirely housed, and possessing means of adjustment to compensate for wear. In the ignition mechanism, small change has been made, the feature of a removable fixed electrode in the make and break sparker, which may be taken out without disturbing the hammer, against dropping in the event of a broken arm, while a quicker reduction is afforded in the gear.

The various types of body suited to this machine are all of broad and ample proportions, and are designed along stable lines.



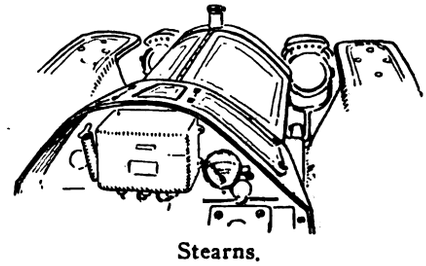
AUTOCAR.

The Autocar chassis common to the limousine, touring car and roadster, is to the forefront in the space of the Autocar Co., of Ardmore, Pa. It mounts a 30 horsepower motor and is gay in whites and reds of special show chassis finish, with generous dashes of blued steel. The motor, base, fly wheel and transmission are contained in a unit case supported at three points, doing away with subframe construction, The two forward points are bolted direct to the frame, and the third, under the transmission, is bolted to a cross member of the frame. A generous torsion rod for the shaft drive is provided but no distance rods, the rear springs taking the forward push. The motor, as in previous models has the inlet valves in the center of the cylinder heads, and double acting push rods for the valves make but one rod necessary to a cylinder. The cylinders are separate, 4¼ by 4½ inch, with integral water jackets. The clutch is of the floating ring fly wheel type as in previous years, a metal faced ring binding over the metal periphery of the fly wheel for engagement. The transmission is the progressive sliding gear type. No unusual departures from conventional construction are apparent, but the unique Autocar system of throttle and spark control from grips in the rim of the steering wheel is retained.



WALTER.

The Walter car is of 40 horsepower, its four cylinder motor dimensions being 5 by 5½ inches; double high tension ignition by battery and Eiseman magneto; cone clutch; selective type change gear giving three forward speeds with direct drive on the third; shaft drive; brakes on drive shaft and on rear wheels. Contrary to usual practices, the right hand member of the two foot pedals releases the clutch, the left pedal applying the full set of brakes simultaneously. The emergency brake lever applies the rear wheel brakes without releasing the clutch. The wheel base is 120 inches, or 4 inches less than that of last year; the wheels are 36 inches diameter, shod with 4 and 5-inch tires, front and rear; the weight of the touring cars is 3,200 pounds.



The motor used this year is materially different from that employed hitherto, the valves being placed on the left side of the motor and actuated from below, instead of being placed in the heads, as previously was the case; the carburetter is now placed on the right side, the intake pipe leading

over to the left side of the cylinder group for delivery. The rear axle group also has been redesigned, a torque rod having been installed in place of the torsion tube used before, the double shackling of the semi-elliptical rear springs necessitating the use of radius rods under the frame sills, these horizontal opposed, water cooled motor set well back in the frame, and driven by double chains through an improved form of friction change gearing. This chassis, which is made in 102 and 92-inch wheel base according to the type of body to be mounted, is otherwise practically the same in each of rise to a curious result, the false radiator at the front having no connection with the main cooler other than as a hood for catching the air. The under pan runs clear forward in this model, and thus the space enclosed beneath the bonnet between the front and the radiator proper is entirely barren

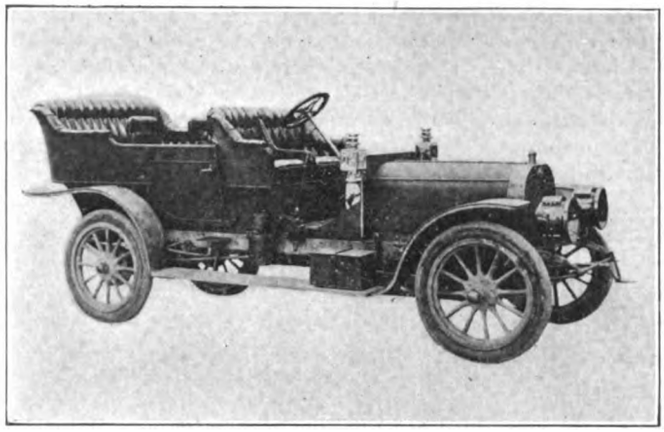
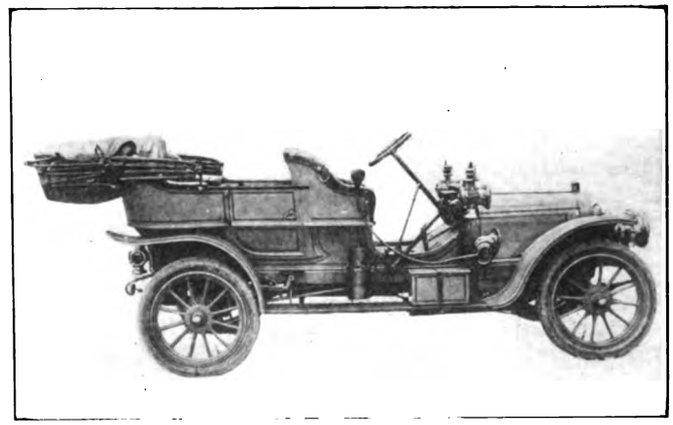
Packard.

Matheson.



members being affixed to collars riding loosely on the ends of the axle tube. Two conventional types of body are mounted on the chassis with comparatively slight alteration, both the limousine and touring types being of ample proportions.

WALTHAM.



The chief feature of the Waltham-Orient line is the new 14 horsepower chassis with the types presented, which comprise a runabout and a roadster, as well as a democrat wagon, which is suitable for commercial purposes and carries a removable rear seat secured to a stout box body of the express type. In each of the machines the radiator is set well to the rear and very low down, the under side of the motor and its mechanism being housed in by a substantial under pan. In the roadster, this practice gives of any paraphernalia, mechanical or otherwise, for some four feet of its length.

The change gear, embodies an ingenious modification of the ordinary double disc form whereby the highest speed ratio is obtained without the slight slippage across the tread which obtains in the ordinary relation. To this end, the two discs which comprise the group are bevelled, and roll together bevel to bevel at high speed, occu-

Digitized by Google

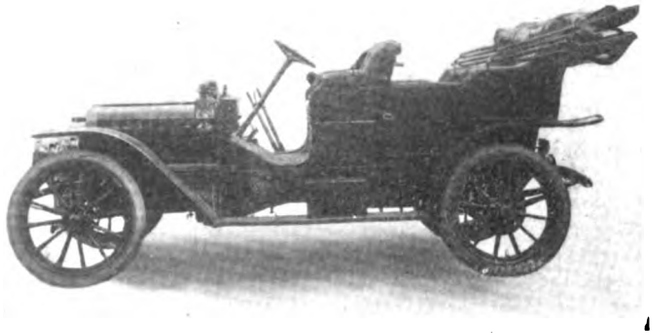
60 H. P. Haynes U.

40 H. P. Haynes W.

pying the exact relation of bevel gears rolling on their pitch surfaces. The method of control is, as heretofore, by pedal and lever.

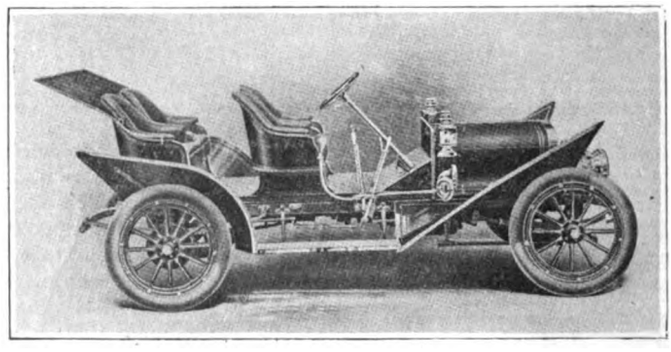
CORBIN.

In the Corbin line is presented the paralleling of both air and water cooled types throughout the complete list of cars manufactured—with one exception. The water cooled Corbin motor is an innovation this year, and is produced, as the Corbin people explain, entirely out of deference to popular sentiment, which even yet is somewhat inclined at times to question the reliability of the air cooled principle. The fact that the Corbin company have absolute faith in air cooling, as well as in their own solution of the problem, is proved by the facts that the air cooled line is continued with few changes of detail, and that the price of the air cooled product is kept slightly above that of the newer type. Except for the motor, the chassis are essentially the same in both cases, while it may be said that the motors are the same except for the single feature of the method of cooling.



The touring car, runabout—a brand new body design with four bucket seats, high backed, and shaped with wings to give a distinctive appearance—a limousine—built only to order—and the "Comet," comprise the line. The latter machine, which is entirely new as to body, though mounted on the standard type air cooled chassis, altered somewhat to suit conditions, is a semi-racer of the most approved pattern, with seat set well back on the frame, leaving an extraordinarily long foot board space in front, cylindrical fuel tank cradled immediately in the rear of the seat, and rounded storage boot beneath. But however much its appearance might serve to draw attention, the novel guarantee under which it is sold, and which supplies it with the catch phrase, "$50 a mile," goes even further in advertising its merits. As it is explained, the machine is sold under a guaranteed speed capacity of 60 miles an hour. If under suitable test it fails to come up to that minimum, the makers agree to deduct from the selling price a sum amounting to $50 for every mile per hour of deficiency. This "anti-come-back" method of marketing, at once inspires absolute confidence in the car, and removes all question as to the good faith under which the guarantee is made.

The Corbin specifications briefly are as follows: Motor, four cylinder vertical, air or water cooled, cylinders 4½ by 4¼ inches bore and stroke, this being an increase of a quarter inch in bore over the cylinders used hitherto; three speed, selective type change gear; shaft drive; wheel base 108 inches; weight 2,200 pounds; tires 34 by 3½ and 34 by 4. The springs are 40 and 50 inches long, front and back, semi-elliptical, and 2 and 2¼ inches wide. Annular ball bearings are used throughout the car excepting only the intermediate crank bearing, and the cam shaft supports.



STUDEBAKER.

In addition to the two previous models of Studebaker gasolene cars, the name this season is carried in a third model of generally heavier specifications and somewhat greater stability as is required by its greater weight and capacity. This machine is driven by a 40 horsepower motor, while the other two are propelled by 30 horsepower plants. The cars are known as models B, A, and H, respectively, and while belonging to the same class of design, they possess several point of difference outside the variations in sizes of parts. Thus the heavier and most recent model has a selective type change gear affording four changes of forward speed with direct drive on the third, and cone clutch with cork inserts, while the smaller cars have progressive gear sets with plain cone clutches of the more familiar type, giving but three speeds. Each type may be had with the usual variations in body construction, those on view at the show being touring cars on the models A and B chassis, and a runabout and limousine on the Model B chassis.

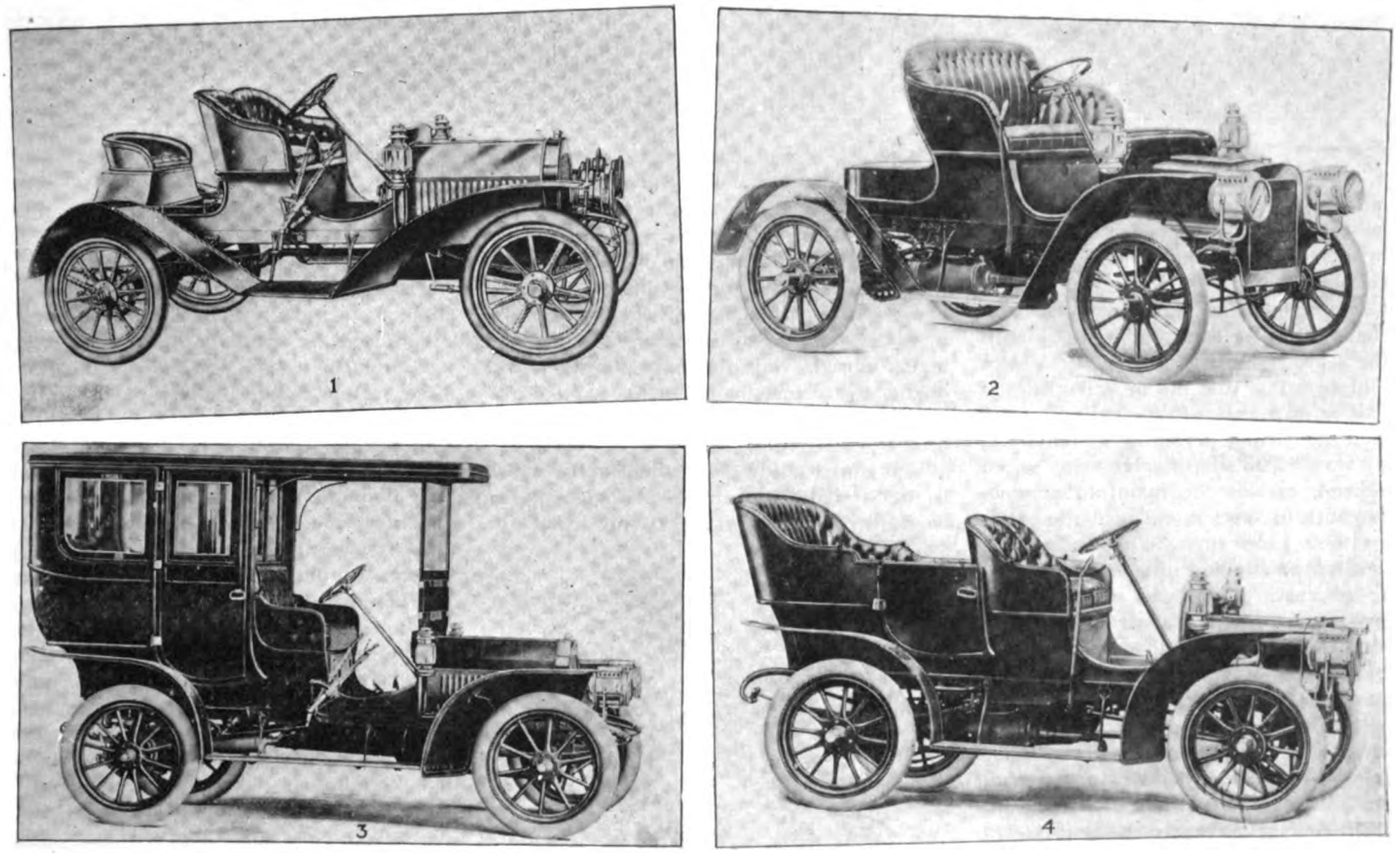
Features which are common to the line may be thus enumerated: Cold rolled,

Corbin, Model S, Water Cooled.

Corbin, Model R, Air Cooled.

Digitized by Google

pressed steel frame, aluminum under pan; wheels, 34 inches diameter; external-internal type brakes on rear wheels; I-beam section drop forged front axles, clutch driven rear members; ball bearings on front axle and throughout rear axle, connecting rod bearings of special white bronze, wrist pin bearings of hardened and ground steel. The cylinder dimensions of the B model are, 4¾ by 5¼ inches, the output being 36 horsepower, by the A. L. A. M. formula, and 40, according to nominal rating; the smaller motor, which is rated at 30 horsepower nominal, and 27.2, A. L. A. M. method, has cylinders 4⅛ by 5¼ inches, bore and stroke. The wheel bases are respectively 114 and 104 inches, and the tire sizes are 4½ inches front and rear, and 4 inches front and rear, except in the case of the A type closed cars, when 4½ inches rear tires are employed.



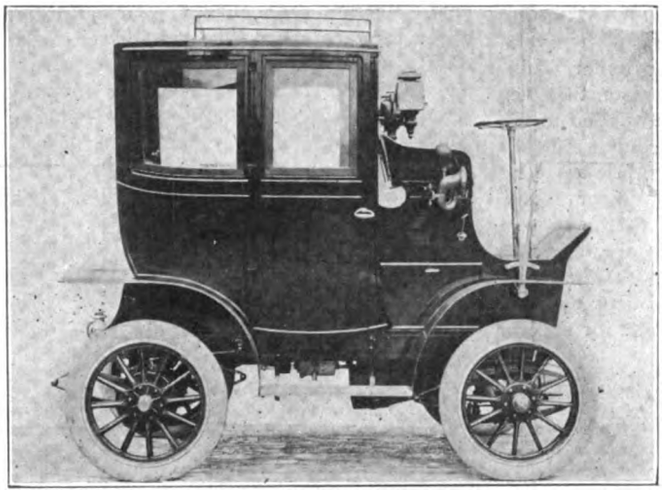
Some little variation also is shown in the method of suspending the chassis, the A and B types having three-quarter platform springs in the rear and semi-elliptical in front, while the H type has semi-elliptical springs all around. Some slight differences in the detail method of hanging the springs to the frames and axles also are observable, but they are of comparatively minor importance. The four complete vehicles and polished chassis shown in this connection comprised one-third of what is said to be the largest individual exhibit in the Garden.

CADILLAC.

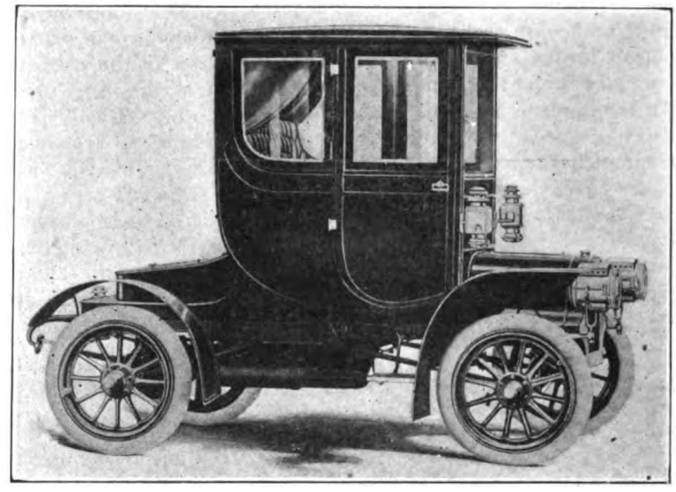
The adoption of the A. L. A. M. rating formula has proved something of a revelation in the case of the four-cylinder Cadillac cars, and delevoped the fact that the 20 horsepower nominal figure applied to the Model G type which was brought out for the first time last year, was far too low. The 1908 rating therefore, has been raised to 25 horsepower, according to the system which is being used by quite a number of makers, and that without any change being required in size or construction of the motor itself. As has been the case for several years, the famous single cylinder car continues to hold no inconspicuous place in the Cadillac family; its appearance this year in somewhat altered body adds not a little to its appearance.

Three types of chassis are the basis of the line, an unusual variety of body equipments, particularly in the case of the small car, serving to amplify the choice thus offered the purchaser to a degree which should brook no lack of satisfaction on that particular score. The specifications of the smallest chassis include: Motor, rated at 10 horsepower; cylinder, 5 by 5 inches, bore and stroke, horizontal type; change gear planetary; drive, single chain; tire sizes, 30 by 3, or 30 by 3½, according to body; springs, transverse, semi-elliptical in front, semi-elliptical rear. Of Model G, the characteristics are: Motor, 4 by 4½ inches, bore and stroke; cylinders copper jacketed; original selective type change gear, affording three forward speed changes; drive, cardan shaft; wheel base 100 inches; tires, 32 by 3½ or 32 by 4 inches, according to body. The large car, Model H, has a 30 horsepower motor, with cylinders, 4⅜ by 5 inches, bore and stroke; change gear, original type of planetary gear affording three forward speed changes; drive by cardan shaft; wheel base 103 inches; tires, 34 by 4 inches, or 34 by 4½ inches, according to body.

As already indicated, there have been comparatively few changes in the constructional details of any of the cars. In all three types, new styles of body have been developed, while in the case of the Model S, the little machine, the wheel base has been increased, while running boards and new and improved types of fenders have been installed, thus altering the appearance of the machine not a little.



Four of the Cadillacs.



FRANKLIN.

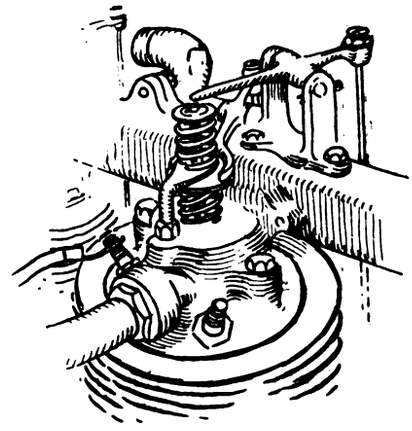
Undoubtedly the mechanical feature of the Franklin exhibit is the new cylinder construction involving the use of hemispherical heads and concentric valves. By this means, as well as by virtue of other and less noticeable changes, a slight increase in dimensions, among them, the power of the motors, has been increased to such an extent that the quadruple type, formely

Digitized by Google

Franklin Cab.

Cadillac Coupe.

rated at 12 horsepower, now is rated at 16; the four-cylinder 20 horsepower motor, has been raised to 28, and the 30 horsepower to 42, in rating.



The arrangement of the new valve permits the casting of the cylinder in identically the same fashion as though there were but a single valve, the line of valve motion being along the axis of the cylinder, and that member being perfectly symmetrical in every way. The single valve cage bolted to the head, carries the manifold connections for both intake and exhaust, the cylinder ports being concentric. The inlet takes the form of an annular opening surrounding the exhaust. The main valve seat in the head carries the inlet valve, which, instead of being a plain mushroom, is a hollow sleeve with a conical flange at its lower end, shaped at the proper angle to take the seat, and drawn in above to a rather substantial stem which is fitted with a collar and spring outside the cylinder, in the usual manner, and is actuated by a walking beam and push rod contrivance from the cam shaft on the left side of the engine base. A long guide for the exhaust valve stem also is fitted into the inlet member.

Seated within the conical flange of the inlet is the exhaust valve, which is of the ordinary mushroom pattern and smaller than is customary—this being made possible by the use of the auxiliary exhaust ports in the cylinder walls at the lower end of piston travel, which are controlled by independent valves, and are calculated to carry away some 70 per cent. of the burnt charge before the main exhaust is opened.

The stem of the main exhaust valve passes up through the hollow opening in the stem of the inlet valve, is topped by the usual collar and spring, the latter resting on a fork surrounding the inlet stem, and mounted on the cylinder head, and being actuated by a second beam and push rod, similar to the first.

As a result of this arrangement, when the inlet gear is actuated by its cam, both valves move together, the inlet passage being opened but the exhaust remaining closed to the cylinder, while the cylindrical body of the inlet valve, isolates the inlet and exhaust ports. When the exhaust gear is operated, on the other hand, the inlet remains closed, while the exhaust valve alone opens, the refuse gases being passed into the exhaust manifold through the interior of the inlet sleeve.

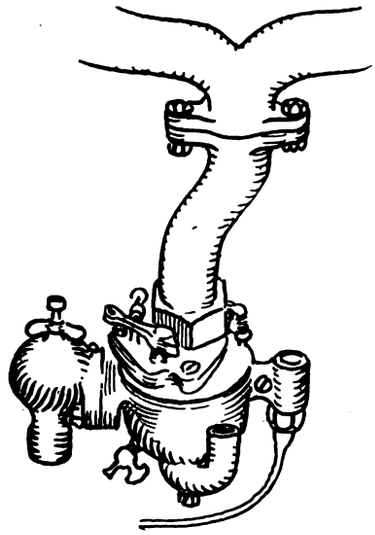
The construction of the inlet valve which is the vital portion of the arrangement has been worked out with extreme care, the

Franklin Concentric Valve Gear.

walls being very thin, to reduce expansion as far as possible, the metal used being a form of chrome nickel steel, which is worked down from the bar, hardened and ground. Under test, this part is stated to have withstood successfully a number of impacts equivalent to those involved in five years of continuous average service on the car. The trial was carried out on an impact machine especially designed for the purpose.

The cylinder dimensions of three types of motors enumerated above are, respectively, 3¼ by 3¼ inches, 4¼ by 4 inches, and 4¼ by 4, the latter being applied to six instead of four cylinders, as in the other two instances. The three types of chassis produced are known as G, D, and H, the first being delivered with runabout or touring body, the second with runabout, touring car or landaulet, and the third with runabout, touring car or limousine bodies. They are mounted on 90, 105, and 127 inch wheel base, respectively, the tire sizes ranging from 30 by 3 by 3½ inches to 34 by 4 by 4½ inches, according to type and style of body. All springs are full elliptic, brakes are mounted on the driving shaft and on the rear wheels, and the change gears are selectively actuated on the two larger types of chassis, but are of the progressive type on the smallest. Multiple disc clutches are used, and the control is standard in respect to the application of pedals and levers.

A newcomer in the line is the Franklin taxicab, which is mounted on the truck chassis, driven by the 16 horsepower motor with worm driving gear on the rear axle, but modified to a certain extent, mainly as regards the suspension, this being similar to that employed on the medium weight touring car. The body of this neat little vehicle is of the cab type and occupies the entire length of the chassis back of the motor space, the latter being completely housed by the front of the body. The driver's seat is raised above to a commanding elevation, and is located at the extreme front of the car. Barring the grilled opening in front of the motor, which serves as intake for the cooling air, there is little in the general appearance of the machine to differentiate it from the electric cabs of common city service, excepting only its weight, which is evidently very low.



SELDEN.

One of the newcomers at the show, and one which, bearing the name of the now famous patentee, is interesting from that fact, if for no other reason, is the Selden, which appears in two models, of 25 and 45 horsepower, respectively. Both types are of uniform and apparently

Digitized by Google

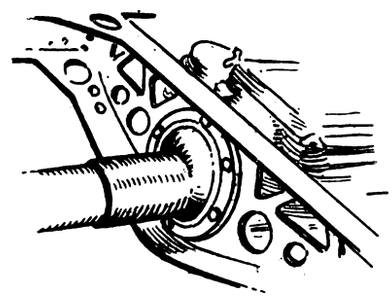
excellent construction, and both involve more or less originality, without in the least diverging from current practice in general respects. The larger and heavier car in particular, reveals a number of original features.

Among the specifications of this machine may be mentioned the cylinder dimensions, which are 5¼ by 6 inches, and the wheel base, 123 inches. The motor is of the T-head type, with oppositely disposed valves worked by direct thrust from below. Double ignition of the high tension type is employed, with two sets of plugs in the cylinder heads. An original form of carburetter is used with this motor, and is of unusually simple and compact construction.

Schebler Carburetter on "Selden Courier."

It may be described briefly as being of the concentric float type, and of plain cylindrical exterior contour. Within, and and above the float chamber, is a plunger or piston valve, seated at the base of the mixing chamber by gravity alone, and capable of entirely closing the air inlet when seated, the air being taken in through the base by way of an annular port surrounding the jet tube. The air rising up past the jet lifts the fuel in the usual way in a straight path to the engine manifold directly above, a gauze screen through which it must pass in entering the two branches of the forked manifold, assisting in breaking up the fuel and mingling it with the air. A water jacket connected in parallel with the cooling system of the motor surrounds the mixing chamber, this and the fuel inlet connection constituting the only connection except that of the manifold above.

As a result of this simple disposition, by loosening four lug bolts which pass from top to bottom of the device, it is possible to dismount simultaneously the float and mixing chambers, as well as to remove the governing or piston valve. In action, the weight of this member is just sufficient to ensure a rate of air flow proportional to that required by the motor speed which develops the suction. At the same time, the lift of the air piston, also serves to lift a small cone needle valve which is adapted to partially close the jet opening, thus proportioning the fuel delivery to the air supply. With this device no auxiliary air valve is employed.

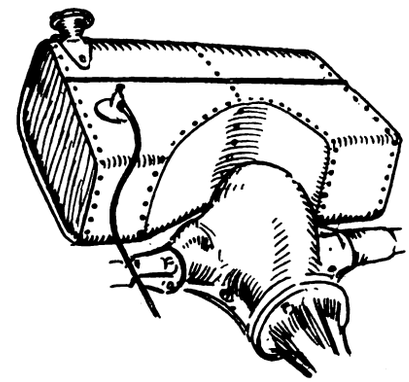


A rather large plain cone type of master clutch is employed, in conjunction with an original form of selectively actuated change speed gear, affording four speeds forward, with direct drive on the fourth. A rather unusual feature of the gear case employed is that instead of the usual cover plates of large size, only two hand holes are provided in the top, protected by screwed-in caps. The case proper is in two parts, and divides along the central line of the bearings. The car is shaft driven, and is heavily framed and mounted.

The smaller car may be outlined thus: Wheel base, 109 inches; wheels, 32 by 3½ inches; annular bearing axle and transmission; three-speed selective gearset; shaft drive; leather-faced cone clutch; motor, 4¼ by 4½ inches, bore and stroke; rated output, 25 horsepower. It is made up either as a five-passenger touring car, or a three-passenger runabout, with the usual rumble seat behind. The weight complete is about 1,900 pounds.

LOZIER.

To the chain-driven, 40 horsepower touring car which has stood in such excellent stead heretofore, the Lozier makers have added two new models this year, embodying two radical and basic departures from their traditions. These are shaft drive, which system is common to both of the new models, and a six cylinder motor. These two types, mount a number of alterations in detail which are innovations as well as advances in Lozier practice.



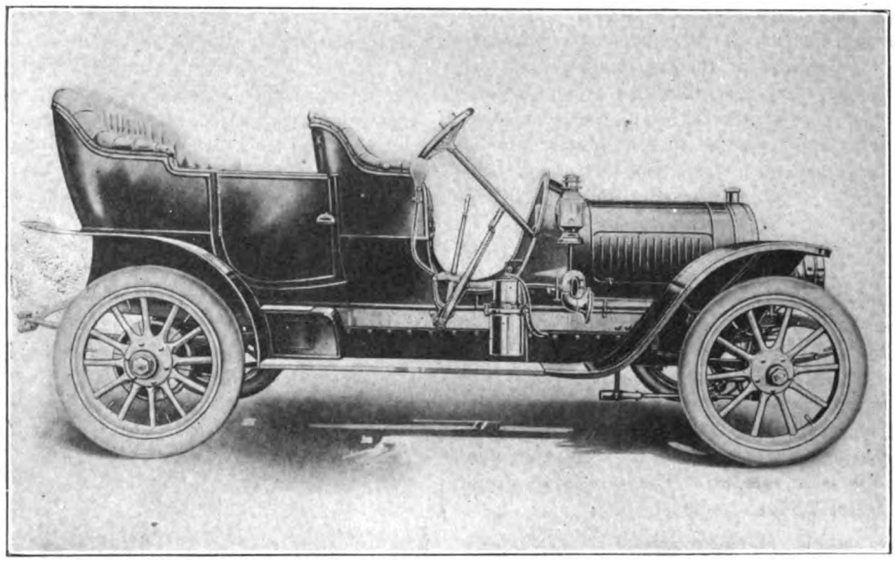
The specifications of the sextuple type are in a word, motor power by A. L. A. M.

Lozier Transmission Mounting.

rating, 50 horsepower; cylinders, 4⅝ by 5½ inches, cast in pairs, with jackets integral and valves actuated from below, the effect of the twin casting and economical arrangement of the annular bearings on the crank shaft being to secure a motor requiring a bonnet space only seven inches longer than that required for the quadruple motor. The complete duplicate system of ignition is employed, high tension throughout. The wheel base is 131 inches, and its weight, with seven-passenger body and full equipment, is 3,400 pounds.

The new four-cylinder car, on the other hand, has these salient features: cylinders 5¼ by 5¼ inches bore and stroke; slightly offset, as in the case with the sextuple motor; A. L. A. M. rating, 45 horsepower; wheel base 124 inches; weight, fully equipped, and with seven-passenger touring body, 3,200 pounds. In the transmission mechanism common to these cars, the clutch is of the multiple disc type, housed in the fly wheel and running in oil. The change gear is of the selective type, affording four forward speeds, with direct connection on the third. The final transmission as well as the mounting of the gear case is somewhat unusual as regards the joint support of the torsion tube and gear case on a single trussed cross member of the frame.

Lozier Fuel Tank.



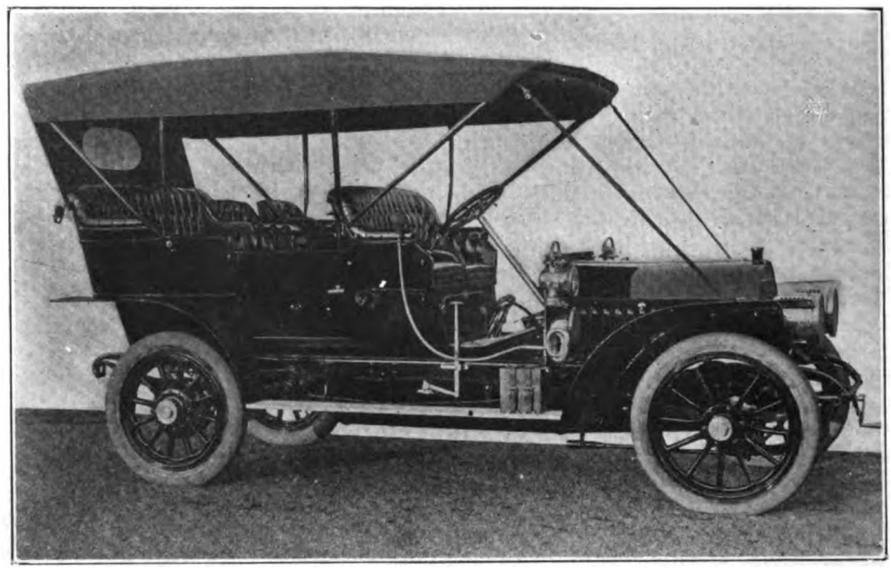
The torsion tube itself rides freely in a bronze sleeve of stable character, which has a ball shaped end, fitting closely a spherical socket in the transverse frame member mentioned. Surrounding the forward end of this socket is a collar by which the rear end of the gear case is carried. Two points of support at the side, and a complete attachment to the cast pan under the fly wheel, complete the hanging of the gearset, the arrangement of the supporting casting being such that a complete cast aluminum under pan is formed beneath the entire power plant. So compact is the arrangement of the driving mechanism that the 30-gallon fuel tank suspended in the rear of the chassis has to be cut away to afford proper clearance for the differential housing.

OLDSMOBILE.

The new six cylinder Olds, known as Model Z, is the headliner at the Olds Works stand. This is a seven passenger car rated at 48 horsepower, with a wheel base of 130 inches. The cylinders, which are 4½ by 4¾ inches, are cast in pairs and have both valves on the same side. The crank case is a one piece aluminum casting. Three cover plates on the lower part of the case give access to the crank shaft and connecting rod bearings. The crank

Digitized by Google

shaft is of hand forged nickel steel, 1⅞ inches in diameter and is supported on four ball bearings, a set on either side of the middle pair of cylinders and a set at each end. Selective transmission is employed with three speeds forward and a reverse, high speed being direct. The transmission is carried in an oil and air tight aluminum case of its own, and has ball bearings throughout. The rear axle is of the Timken full-floating type, with a tubular strut rod and a nickle steel torsion rod. Full elliptic springs are used at the back. Spark and throttle levers are on the steering wheel but an accelerator foot button is also provided for driving through heavy traffic. Double ignition, storage battery and magneto, is supplied. The show car, finished in natural wood, is comfortable, and pleasing to the eye. A burnished chassis of the Model M, 36 horsepower, four cylinder Olds, which presents several changes over last year, is also on view. The open hearth steel frame is raised considerably at the back to accommodate full elliptic springs. The transmission is carried on full ball bearings, the ends of the transmission case being composed of the bronze holders for the bearing sets. These holders are threaded and may be screwed in or out for adjustment or removal. Simms-Bosch magneto ignition and cork inserts for the clutch are further 1908 features for this model. The Model M, dressed in various bodies, has as companions the Model MR, a smart runabout with the same mechanical equipment, and the Model X, a 32 horsepower car for five passengers.

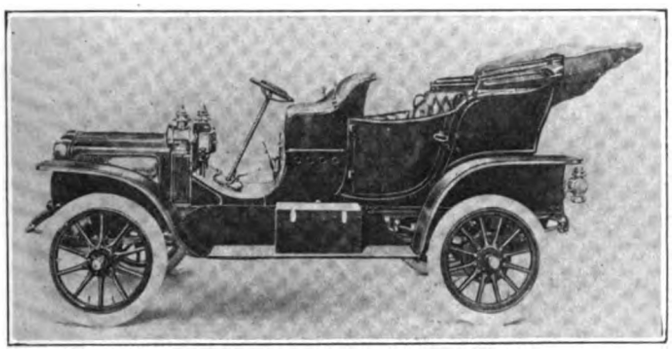


Pope-Hartford, Model M.

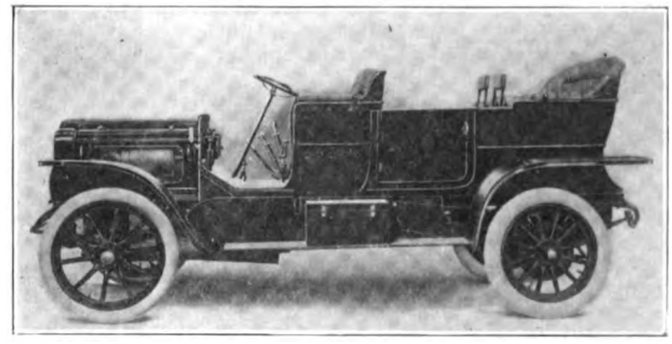
POPE-HARTFORD.

The new Model M Pope-Hartford occupies the center of the stage at the exhibit of the Pope Mfg. Co., of Hartford, Conn. It is a refinement of previous models. The motor, rated at 30 horsepower, has the cylinders cast in pairs with integral heads and water jackets. The valves, located in the heads, are interchangeable and are operated by one set of cams and push rods. The clutch, of the reversed cone type, has both large diameter and wide face. Leather with 34 compressed cork inserts makes the clutch surface. Selective transmission, three speeds forward, is used and the gear teeth this year are beveled to facilitate engagement in gear changing. The rear axle, fitted with Timkin roller bearings, is of the clutch type instead of the semi-floating variety formerly used, so that with the new model it is possible to take out all the interior rear axle driving mechanism without disturbing the rear wheels beyond removing the hub caps to withdraw the driving axles. An improved carburetter is used for 1908, designed to prevent flooding. Ignition and throttle control center on the top of the steering wheel on a non-revolving sector. The steering wheel itself is 17 inches in diameter and is made of aluminum with a mahogany rim.

Fitted with wind shield, top and a complete outfit of extras, a Model M with a striped Brewster green body and brilliant, shining red upholstery attracts a great deal of attention. By edging the top of the tonneau sides with strips of mahogany a very pretty finish touch has been added. The same car is also shown in its regular catalog form, with a "purple lake" finish to the body which is very rich, the effect being a deep translucent maroon. A runabout in red completes the Model M display. The Model R Pope-Hartford, lower in price, is shown as a touring car and with a limousine body. This model is similar in appearance and general lines to the Model M, but is fitted with Dow magneto ignition instead of batteries, and represents many little economies of construction in the motor and other parts. Two Pope-Tribune models are shown, a touring car in red and a French gray runabout.



Columbia Gasolene-Electric.

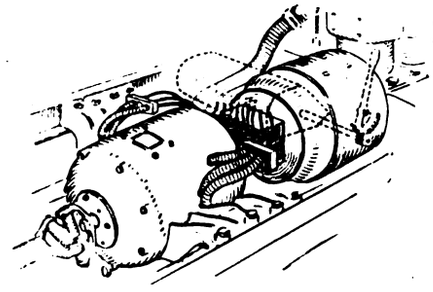


LOCOMOBILE.

Having first been introduced to the public shortly after midsummer, the 1908 Locomobile line appears at the show as an already well known and thoroughly proven group of vehicles, which therefore, and because they are practically unchanged from previous models, are to be considered as exhibits of structural excellence rather than as mechanical novelties, or sensational disclosures. The name Locomobile is applied to two types of chassis, one of 20 and the other of 40 horsepower, each being adaptable to the uses of either touring car, runabout or limousine. The ever increasing popularity of the closed car for city and

Digitized by Google

White, Model L.



White, Model K.

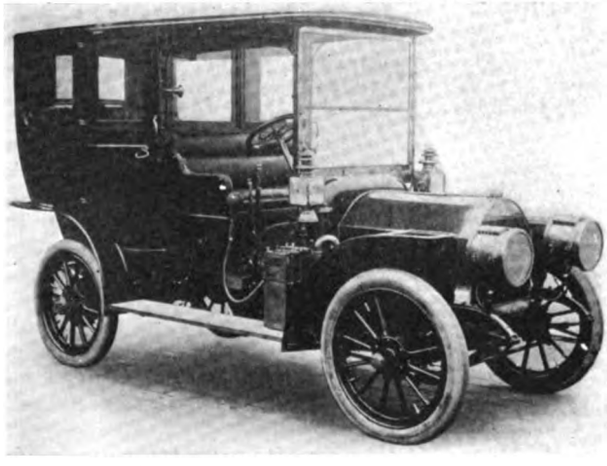
suburban use the year round, however, in this case has stimulated the development of two very excellent and graceful limousines, one, of trim-looking design as applied to the smaller chassis, and the other of ample proportions, designed for the more luxurious purposes of the larger.

Type "I," which is a counterpart of the 1907 type "H," only a trifle enlarged and improved, may be described in outline thus: Motor, 5 by 6 inches; cylinder dimensions instead of 4½ by 5, as in type H; cylinders cast in pairs; valves mounted on opposite sides and actuated from below by direct thrust; ignition by low tension magneto make and break ignitors, with auxiliary starting equipment of accumulators; selective type change gear, affording four forward changes of speed; chain drive; wheel base 123 inches; tires, 36 by 4 by 4½ inches.

Though similar to last year's car in many respects, a few alterations have been made in addition to the increases in power and wheel base. How insignificant these exceptions are, however, is shown by mentioning one or two other of the more important ones, such as the adoption of a new form of hot air intake for the carburetter, which is affixed directly to the exhaust manifold; the removal of the clamping screw which binds the fastening yoke to the magneto from the side to the more convenient position at the top of the magnet; and the use of a flexible coupling on the pump shaft.

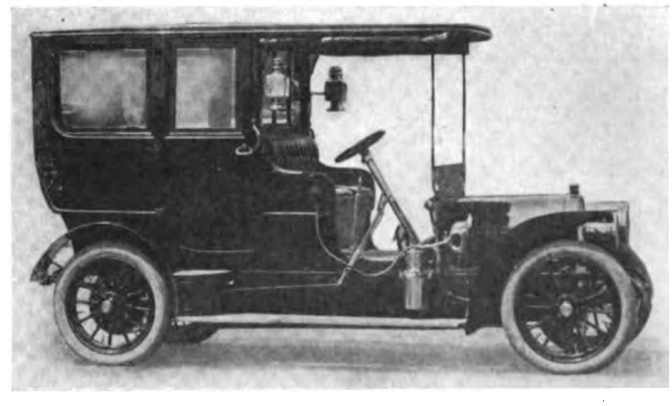
Type E has the same general mechanical features as the larger car, but on a reduced scale. Its wheel base is 102 inches, or 116 inches, where the limousine body is used.

Columbia Electric Transmission.



Both machines are of original design throughout, are massive in construction, yet it is noteworthy that they are designed with such skill as to be entirely free from any suggestion of clumsiness.

COLUMBIA.



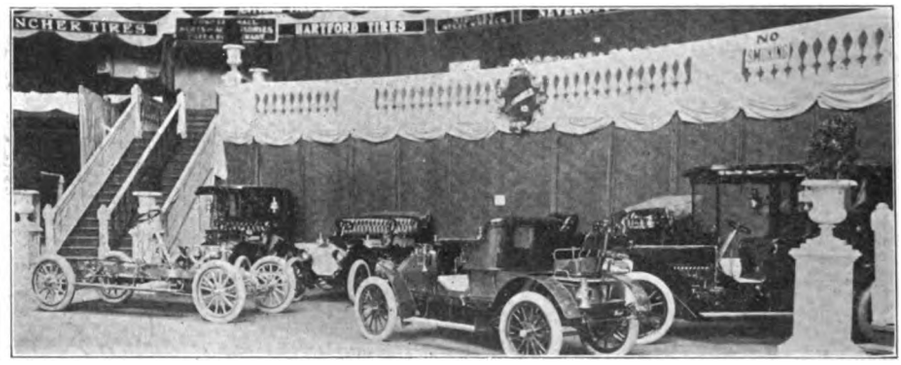
The presence of a model chassis of the Columbia gasolene-electric car, or more properly speaking, "the car with the electric transmission," serves to draw a great deal of attention to that vehicle, as well it may. Although shown in the form of a complete vehicle last year for the first time, it attracted far less attention then than now, probably owing to the advantage of the completely exposed mechanism in the present case. The fact that the car has been redesigned to a certain extent, and that it has a new and perfectly suitable motor, however, adds to the interest which otherwise attaches to it.

The electric transmission, which does away with all mechanical gearing between the engine and the differential group on the rear axle, if somewhat complicated in exact electrical theory, certainly is the very essence of mechanical simplicity. It consists merely of two electrical units—dynamo and motor—arranged with their rotary parts mounted directly on the driving shaft of the car. A special form of jaw clutch between them, and an electric controller of the rotating drum type, actuated by two levers, comprise the entire mechanism of control. Taking the place of the ordinary motor fly wheel, is an annular drum which is wound to form the field magnet of an electrical generator, the armature of which fits closely within it, but has no mechanical connection with it, its shaft being perfectly free to revolve independently of the speed of the motor as far as the mechanism alone is concerned.

Whenever the engine is turning, and the armature stationary, or whenever both are turning, but at different rates of speed, an

Studebaker, Model H.

Locomobile, Type E.



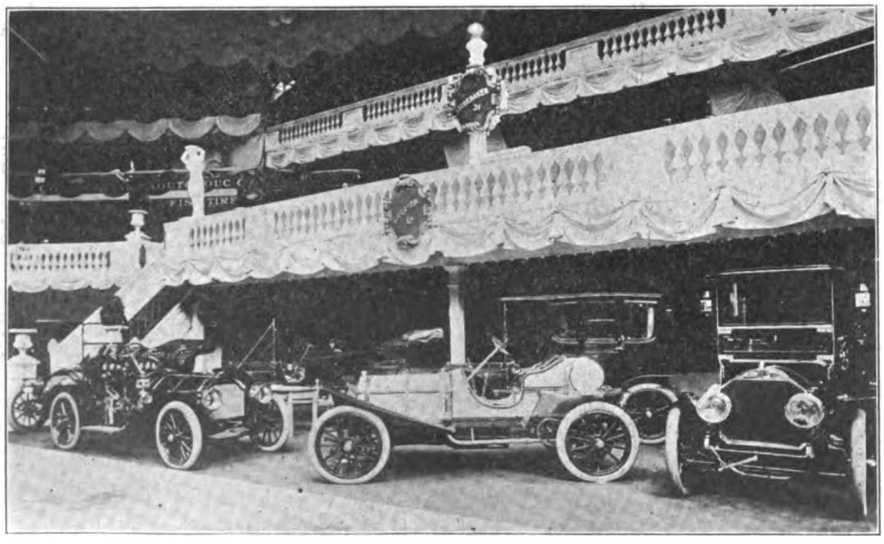
Digitized by Google

electric current must be generated, as a matter of course. The generation of this current requires a certain amount of energy, however, and consequently if the armature is free to turn about its own axis, when the circuit is closed, the tendency is for the field to pull the armature around with it, but at a slightly reduced rate of speed. This constitutes in effect an electro-magnetic clutch, and is used for the direct drive, or ordinary running speed, the armature shaft being in line with the propeller shaft of the car, and directly connected with it at this time.

In order to obtain differences of speed between the engine and propeller shaft greater than this simple arrangement would permit, a second member is added, which is nothing more nor less than an ordinary electric motor having a stationary field and revolving armature which also is mounted on the propeller shaft a short distance back of the generator clutch. When it is desired to run the car more slowly than the normal engine speed permits with the direct drive, electrical connection is made between the dynamo circuit and the motor, as a result of which the current generated by the rotation of the field and armature of the generator at different rates of speed, is carried over to the motor, where it serves a useful purpose in helping to pull over the propeller shaft.

By the use of suitable controller connections, similar in a general way to those employed on electric street cars, it is possible to vary the speed of the shaft through a considerable range, while the speed of the engine remains constant. In this way five changes of forward speed are secured without the use of gearing of any sort, the only manipulation required in effecting them, being the progressive movement of the controller handle.

To obtain the reverse, it is necessary to move a lever which disconnects a jaw clutch between the generator and motor, at the same time locking the armature of the generator fast to the frame of the car, and converting the generator-clutch into an ordinary dynamo in which the fields revolve instead of the armature, but which otherwise is perfectly regular. This being done, the current generated by the motion of the engine, may be used in driving the motor on the propeller shaft in either direction and at various speeds. In practice, but two reverse speeds are employed. Suitable manipulation of the electrical connections provides in addition to the forward and reverse driving relations, a perfectly reliable and efficient electrical brake, which is strictly double acting.

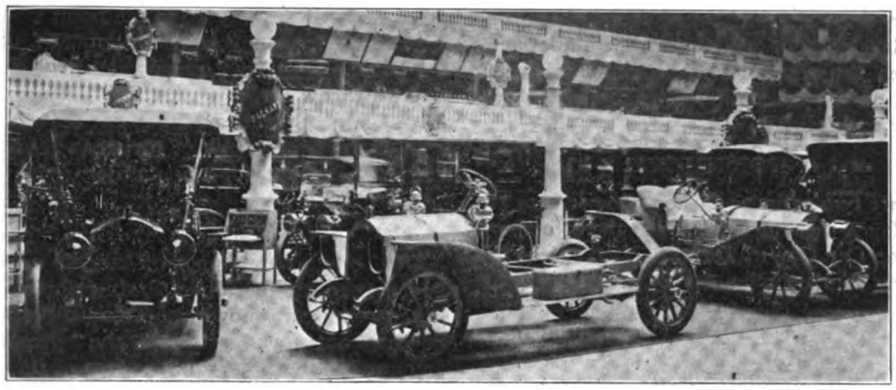


Locomobile Exhibit.

The 50 horsepower motor which is used in this machine, has cylinders, 5½ by 5½ inches, bore and stroke, cast in pairs, and with the inlet valves placed in offset pockets directly over the exhausts, and actuated by push rods and walking beams. The intake and exhaust ports for each cylinder group are siamesed, the piping thus being considerably simplified, the intake being led up from the right side of the motor to the top of each of the twin castings, where the gases are led in in a vertical direction, this disposition being somewhat unusual. Ignition is by jump spark, and the usual auxiliaries reveal little that is exceptional.

A new rear axle group is another new feature of the electric transmission car this year, a double jointed cardan shaft being employed, with torque and radius rod connections between the axle and chassis. These parts are particularly substantial looking, the radius rods in particular being noteworthy in that they are of pressed steel, channel section, and carry short rocker shafts which serve as a connecting link in the brake mechanism, giving it a direct line of tension from the main rocker shafts inside the frame, to the braking arms just inside the wheels. The brakes are of the external-internal type, actuated by pedal, and equalized by means of cables running over small sheaves on the extremities of the rocker arms.

The Columbia light touring car has been considerably improved since last year, the motor having been increased in size, its cylinders now measuring 4¼ by 4½ inches, and the rated output consequently being 28 horsepower, while the water jacket volumes have been increased to some extent, and the firing holes of the make and break ignitors have been reduced in size. In addition to this, the change speed gearing now is mounted entirely on annular bearings, the clutch diameter has been increased, the diameters of the steering hand wheel and the road wheels also having been enlarged, the latter to 34 inches. Otherwise, and except for the newly designed bodies, the car remains practically as during the last two years.



Apperson Exhibit.

WHITE.

As the sole exponent of the gospel of steam as applied to motor car construction exhibited at the Garden, as well as the carrier of what is beyond a doubt the most complete and efficient steam plant of its size in use for any purpose, the mechanism of the White car proves a strong center of attraction for the mechanically inclined, as well as those who are interested merely in the externals of the machine. Two models are shown this year, as last, the exhibit appearing in the "Licensed" show for the first time since separate shows have been held.

Model K is of 30 horsepower, and Model L has a 20 horsepower plant, in general,

Digitized by Google

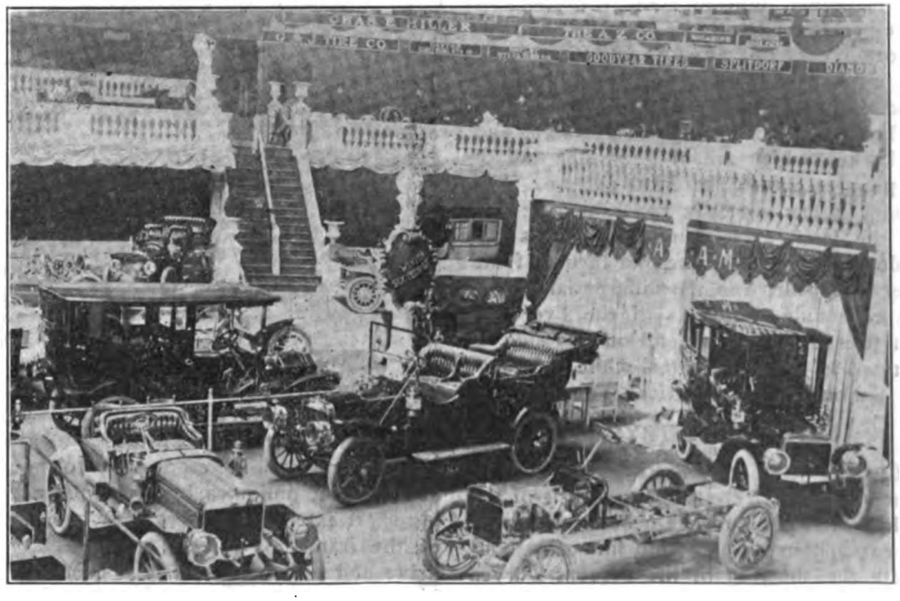
Packard Exhibit.

no startling changes have been developed for either model, but certain improvements have been made which are significant in their way. One of these, which applies to both types, relates to the placing of the thermostat, which governs the temperature of the steam, and plays an important though somewhat delicate part in the final regulation of the working fluid. The construction of this device also has undergone some little alteration.

The water supply to the semi-flash generator being derived from two parallel sources under independent control, the function of the thermostat is to supplement the action of the "regulator," which responds only to variations in steam pressure, by a more sensitive action affecting directly the temperature of the steam. To this end, a bronze rod of special alloy is supported in the steam line, and the latter being of iron, any changes in temperature of the steam will cause an unequal expansion of the two elements, thus producing a very slight motion on the part of the bronze piece, which is multiplied through linkage, and utilized in governing a valve by means of which water is introduced into the generator whenever the temperature of the steam becomes too high, thus lowering it at once; the reverse action taking place, and the valve being closed whenever the temperature of the steam falls below a certain point. So fine is the regulation developed in this way, that it is claimed that in practice on the road, the temperature of the steam seldom exceeds a variation of 10 degrees Centigrade.

The action of the thermostat is now checked by means of a thermometer placed within easy reading distance of the operator and in plain sight at all times. Furthermore, the device itself is located in such a position that it may be reached either from the side of the car, or through the footboard at an instant's notice. The new location is such that there is sufficient flow of steam over the expanding member to prevent any incrustation due to the use of impure water which otherwise might tend to occur.

A straight line type of body is now applied to Model K, considerably altering its appearance, while the lengthening of the wheel base from 116 to 122 inches, and the lowering of the car as a whole by hanging the generator and motor lower in the frame, but without altering the road clearance, which remains 10½ inches, as hitherto, in addition to increasing its stability, also have served to modify its appearance.



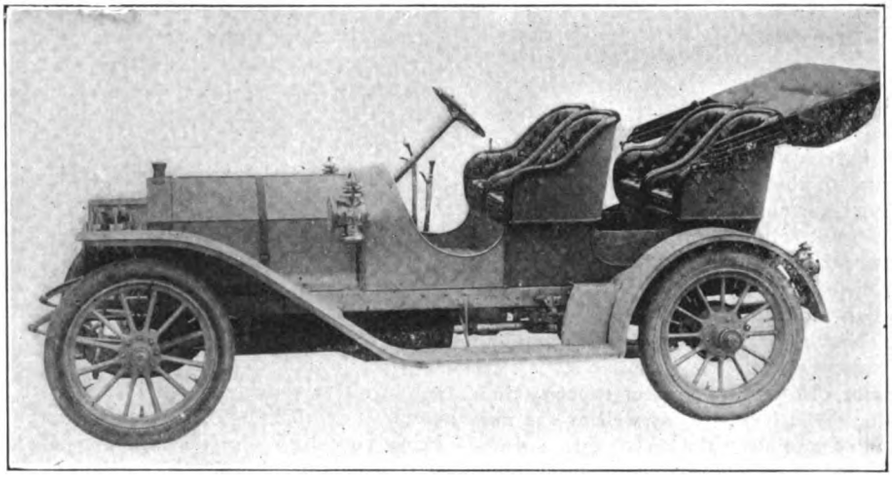
The smaller car has not been altered in these respects, but the adoption of a new generator of one-third greater capacity than that employed last year, as well as the new method of mounting the motor on an aluminum pan, thus eliminating the subframe construction, are changes which are by no means insignificant.

HAYNES.

By the development of a third and new type, the Haynes line has now been brought up to an even gradation in three steps from the Model S, at 30 horsepower, to the Model U at 60. Model W, the new car, which is shown for the first time, in addition to a number of other original features, possesses a double fly wheel construction which is absolutely new.

Instead of bulking the entire mass of the fly wheel at the rear end of the crank shaft, the same weight is used which naturally would be required with that arrangement, the fly wheel being built in two sections, as it were, and a portion amounting to less that one-half of it is placed at the forward end of the motor where, in addition to its nominal function it is useful as a belt pulley for the fan drive. This secondary balance wheel is of smaller diameter than the other, and consequently reacts on the variations of torque in a different way from that of the main member. In addition to this, the fact that the two parts co-act upon opposite ends of the shaft probably gives additional aid in steadying the movement of the motor. Both the cylinders and cam shafts are offset (the former by 3/8 inch), the result being a motor of exceptionally smooth action even at a moderate and very low speed and under load, as well as one which is "absolutely free" from the "gas" knock, which sometimes accompanies slow-speed running.

The general details of this model are: Output, 45 horsepower; cylinders, cast in pairs with oppositely placed valves, the Haynes method of coring large openings in the heads to provide means of access to the combustion chambers for cleaning purposes, being continued; double, high tension ignition; three-speed, selective change gear; shaft drive; wheel base, 106 inches; tires, 34 by 4 inches; weight, 2,650 pounds. In the change gear group, the use of the ratchet driving gear for the lay shaft—an exclusive Haynes feature—is continued, while the roller gear bevel drive in the axle group, also remains a distinctive feature. The torque bar, which formerly was placed vertically from the differential housing and projected between a pair of roller guides and up into the body under the rear seat, is continued in principle, but reversed in form. That is to say, an arm projects between the legs of a forked extension of the differential casing, the result accomplished being precisely the same as in the original sys-



Winton Exhibit.

Digitized by Google

tem, the space under the seat, however, being left perfectly free for storage purposes.

This altered construction of the torque bar, also is applied to Model U, the 60 horsepower car, which has been changed in a number of other ways since its introduction. Of these changes, the most important center about the engine, which has the double fly wheel arrangement, enlarged valves, a hot air intake for the carburetter, and double ignition, these improvements

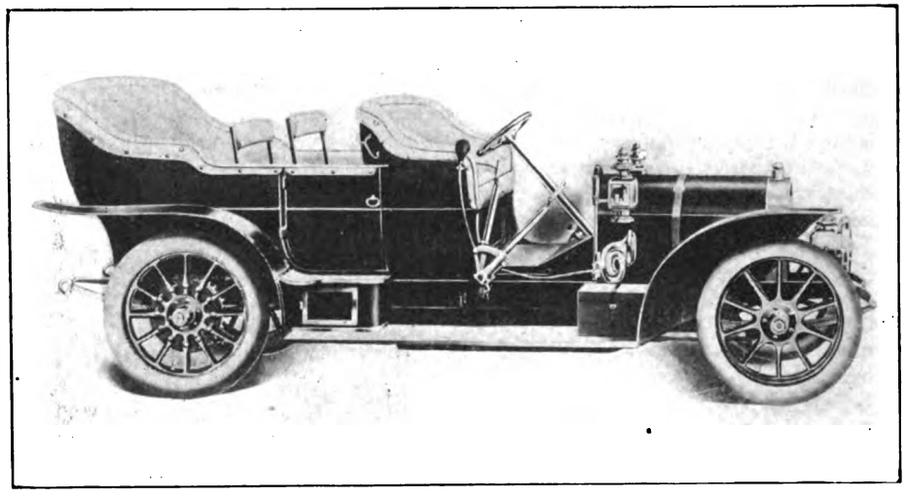
Apperson, Model M.

furnishing an authentic reason for increasing the power rating from 50—the former figure—to its present amount. The superficial details of the car are: Cylinder dimensions, 5½ by 6 inches; wheel base, 118 inches; tire sizes, 36 by 4½ inches, front and rear; the weight complete, with touring body, 2,950.

The third car of the line, Model S, is continued practically as heretofore. It has a 3¼ by 5 inch, 30 horsepower, four cylinder motor, selective change gear, shaft drive, 102 inch wheel base, and 34 by 4 inch tires. It weighs comething like 2,250 pounds, and its regular touring body is adapted to a five-passenger load. Features of this and the other cars not already enumerated are the pressed steel frames, reinforced with wood, the clutch, which is of the contracting band type and of original design, and the brakes, which are of good size and of the popular external-internal pattern. The Haynes is exclusively a roller bearing car. For the front axles, Timken bearings are employed, as also for the end thrust of the roller pinion drive in the differential group. The rear axle, which is of the live type with telescoped driving end on one side, is mounted in Hyatt bearings, while the gear set is mounted on American bearings.

STEVENS-DURYEA.

"Big Six" cars with touring body and limousine, respectively, a show chassis of the "light six," together with a new four cylinder car in touring body and limousine constitute the showing of the Stevens-Duryea Co., of Chicopee Falls, Mass. The six-cylinder cars are unchanged from those put out last season, and the four cylinder embodies the construction refinements developed on the other models, except as to cylinder multiplicity.



NORTHERN.

Only two-cylinder 24 horsepower cars are displayed at the space of the Northern Motor Car Co., of Detroit, Mich., although a new four-cylinder car is promised for a little later in the season. The chassis displayed emphasizes the claims for simplicity and compactness of mechanism that are made, although it is bare of radiator and other necessaries that when added would lessen the effect to some degree. The double opposed motor is mounted in front, under the hood, and immediately back of it is placed the planetary transmission. Motor and transmission are so tilted as to give a straight line from the crank shaft to the rear axle driving pinion, a long one piece driving shaft extending almost the whole length of the frame. The rear springs take the drive and a torsion rod is dispensed with by the use of a tube housing covering the drive shaft all the way up to the point where it emerges from the transmission in front, the leverage obtained making it permissible thus to throw a slight twist friction on the drive shaft. By this arrangement the whole rear of the frame back of the dash is clean and bare, except for the muffler.

APPERSON.

Of the two new Apperson models exhibited, safe to say the Model S, six-cylinder, 50 horsepower car, shown most conspicuously in runabout form, attracts the greatest amount of attention from the fact of its extreme compactness of motor build, as well as the neat details of its external appearance. Noteworthy points in connection with its motor equipment are the use of T-head independent cylinders, the bore and stroke of which is 4½ by 5 inches; the use of complete double ignition with two sets of plugs, the usual multiplicity of electrical connections so frequently in evidence where this system is used being notably absent in this case, the leads for each set of plugs being taken through brass conduits permanently affixed to the tops of the cylinders, and all loose and aimless connections being dispensed with; the elimination of waste room in the bonnet, the cylinders nearly filling the hooded space, both longitudinally and vertically, while the auxiliaries are compactly arranged, and also, as a result of this, the freedom from that ostentation in the general appearance of the machine, which becomes objectionable in several types of six-cylinder car.

The second new model on view, which, incidentally is more or less of an innovation in the Apperson ranks, since it is shaft driven, appears in the form of a four-seated runabout with individual seats of the same size front and rear, a not uncomely body, and roomy passenger accommodations. The motor of this, Model M, car is of the four-cylinder variety, with cylinders 4¼ by 5 inches, bore and stroke, and rated at 30 horsepower. The wheel base is 106¼

Thomas 40.

Digitized by Google

inches, the tires are 34 by 4 inches, the weight is 2,400 pounds.

Model K, the 50 horsepower touring car, which is somewhat similar to the new six in general specifications, but is driven by a 5½ by 5 inch four-cylinder motor, is continued from last year in improved form. Its wheel base is 114 inches, wheel and tire sizes, 36 by 4 by 4½ inches, and its weight in touring car form 3,200 pounds.

The change gear systems of all the cars are of the selective type, that on the model M affording three forward speed changes, while the larger cars are provided with a fourth speed as well. Double chain drive is used on all except the Model M car, and a special type of contracting band clutch also is featured. Mounting the same general features as the four-cylinder touring car, but of semi-racing build and specialized accordingly in several particulars, the "Jackrabbit" is, like the touring car, continued with only such minor alterations in structural detail as have been found necessary.

PACKARD.

Probably no stauncher or more famous exponent of the one-design-a-year principle exists in the American market than the Packard, which is continued over from year to year, with few changes, if any, in its makeup, yet without falling back into the leftover class at any time. This is due in part to the fact that its fundamental design was correct originally, though rated somewhat radical at the time of its introduction, and in part to the fact that a certain number of refinements are made each year in so subtle a fashion as to bring the new model into line with others in its class, without in the least destroying the semblance of the absolute constancy in detail which is only infringed upon in minor ways. The Packard exhibit displays the touring, runabout and limousine models.

The specifications peculiar to the standard model are, motor, rated 30 horsepower; cylinders, 5 by 5½ inches, bore and stroke; valves placed on opposite sides of the cylinders; ignition, double with a single set of plugs, the Eiseman low tension magneto being supplemented by a storage battery, the vibrator coil for which is mounted on the dash along with the transformer for the magneto; master clutch of the internal expanding type, actuated by screw and nut mechanism; transmission, propeller shaft with double universal joints; change gear mounted on the rear axle in housing made integral with that of the differential group; brakes, internal-external on rear wheels; wheel base, 123½ inches; tires, 36 by 4 by 4½, front and rear for the touring car, and 36 by 3½ by 4, for the runabout.

Of the changes which serve to distinguish the present type from previous models, the use of the 36-inch tires is the most noteworthy, not alone because it is the only one which is conspicuous, but also because the alteration has been accomplished without disturbing the center of gravity of the vehicle as a whole, notwithstanding the fact that its axles have been raised. This effect has been secured by arching the rear of the frame so that the springs may be set lower, thus allowing them full play without risking the bumping of the axle under strenuous highway conditions. The wheel base also represents a slight increase over that of last year, the difference in length having been introduced entirely in front of the dash, giving the front springs a better leverage on their load, and tending to make the car ride easier in front. The diameter of the steering wheel has been increased, also, as has that of the steering column; which thus is made even more substantial than hitherto. The radiator capacity has been increased somewhat, as has that of the lubricating oil tank, which holds approximately twice as much as before. The radiator also is fitted with a new type of filling cap with a form of bayonet lock.

The master clutch has been altered to the extent of adding a relieving spring to one side to ease the gripping action coming with too sudden release of the pedal, while the pedal linkage controling the clutch has been altered in such a way as to decrease the throw of the pedals. A change in the construction of the axle transmission group which has added something to its strength as well as improving its appearance very materially, consists in the use of internal strengthening webbs on the casing, instead of the external flanges which were formerly employed. A few detailed alterations have been made in the delineation of the bodies, but they are comparatively insignificant, with the possible exception of the limousine body, which is now pocketed at the sides in order to give more inside room with the same amount of wheel clearance as before.

ELMORE.

As the sole exponent of the two-cycle principle to be found in the Garden, the Elmore cars, as in former years, are centers of no small amount of interest and enthusiasm. Incidentally, the growing production of six-cylinder motors of the four-cycle type, has served as a strong text for preaching the two-cycle gospel, and the amount of technical discussion which the week has developed about the Elmore stand has been of a voluminous and instructive nature. Two types of car are produced under this aegis, namely the "30" and the "40," of three and four cylinders, respectively. Both are continuances of former models, but with sundry changes which make for a decided betterment in action. It is significant, however, that these alterations relate mainly to the construction of the chassis and not to the motors.

The larger car has a three port valveless motor, of 4½ by 4 inches, cylinder dimensions, selective type, change gear affording three forward speeds, shaft drive, 110-inch wheel base, 34 by 4 inch tires, and weighs equipped, 2,250 pounds. The dimensions of the three-cylinder motor are the same, per cylinder, while the overall specifications of the car are 104-inch wheel base, 32 by 3½ inch tires, and weight, 2,100 pounds.

The Atwater-Kent timer system has been adopted for the new cars, in addition to which, such changes as an increase in the wheel base of the larger, the adoption of a new type of steering gear, and the use of a new type of air cooled emergency brake on the rear wheel, as well as the use of an improved form of rear axle, are to be observed. In this connection, it is noteworthy that the three-quarter platform suspension used in the rear is supplemented by the use of helical springs mounted in tension between the rear axle and brackets offset from the side frame members on the inside of the chassis.

BUICK.

The strong feature of the Buick line for 1908 is the brand new offering of a 20 horsepower, four-cylinder runabout, with rumble seat, for $850. This little machine, which has a particularly sturdy and gratifying appearance, and seems to be quite the marvel it is claimed to be, has a vertical motor with cylinders, 3¼ by 3¼ inches, bore and stroke, with valves in the head seated in removable cages, actuated by push rods and walking beams, planetary change gear, shaft drive, semi-elliptical front and full elliptical rear suspension, expanding brakes on rear wheels, contracting band brake on drive shaft, 88-inch wheel base, and 30 by 3 inch tires. The power plant is mounted on a sub-frame, which, like the main frame, is of pressed steel. The parts are all compactly and neatly designed, and the general effect is that of a staunch and reliable machine of the light class.

A second innovation in the Buick line is a 2,000-pound, 24 horsepower touring car of the medium priced class, which is built much more solidly and in more general accordance with common practice. It has 106-inch wheel base, 32 by 4 inch tires, selective type change gear, shaft drive, multiple disc clutch, full elliptic rear springs. The models made last year are again continued with various improvements.

STEARNS.

What is little short of freak body design is disclosed on the four and six cylinder four-passenger roadsters at the space of the F. B. Stearns Co., of Cleveland. The two front seats, with very low backs are but a few inches above the floor, and are "staggered" so that the driver's seat is considerably in advance of that of his companion. The passenger who rides thus on the driver's port quarter, as it were, has an immense area of floor space in front of him, so that he may squeeze his shoulder blades into the little cup shaped seat and lie supine along the floor with his legs stretched forward till they reach a brass footrail that is provided. The two rear passengers, while having less provision for

Digitized by Google

reclining positions, are nevertheless given the same sort of indentations to sit in. An outrigger seat over the running board, for the chauffeur when he is not at the wheel, is further provided on the four cylinder roadster, an innovation which suggests great possibilities of dotting extra seats in many now unthought-of places. The cars are finished in the richest style and however much on first view the passengers' comfort may be doubted, they present a striking and imposing appearance. The Stearns four cylinder chassis is on display but presents no radical changes over the model made familiar during the past season. A seven passenger touring car on this chassis is shown which is a delight to look upon. It is finished in broad alternate stripes of deep green and black.

KNOX.

The feature of the Knox exhibit is the type L car, shown in addition to the several types of air cooled machines which are practically unchanged; it is the first Knox to employ a water cooled motor, but otherwise agrees in general specifications with the Model H of last year. The motor in question, which is 4⅜ by 4¼ inches cylinder dimensions, and is rated at 30.6 horsepower, is of the same general type as the air cooled original, is mounted on the same type of unit base, and has valves in the head, actuated by push rods from a single cam shaft. An unusual feature of the construction is the use of independent cylinder heads, which, though completely water jacketed, are held to the main cylinder castings by means of four lug bolts.

The Electric Pleasure Cars in Evidence

Like a "wheel within wheels" the electric vehicles are having a show within a show and are monopolizing the large room which was formerly known as "the restaurant," but which has of late years suffered so many interruptions in the meal survice on account of various shows and exhibits that it is now given the more dignified designation of the "Madison avenue exhibition hall."

Here the electric pleasure vehicles reign supreme, nearly all of them being gathered in the one fold, the exceptions having to be located elsewhere through lack of room. The exhibits of electric models show a most enterprising diversity, from speedy runabouts capable of almost 40 miles per hour to the most practical and economical of service rigs, and from dainty little Victoria type phaetons to immense and luxurious family carriages. The mileage and speed possibilities of the regular types show marked increases. The difficulties that confronted the prospective purchaser in former years as to getting proper charging current are also lessened, as rectifying and charging apparatus is offered in variety, giving evidence of the growing wisdom of the makers of electrics in making easy the maintenance of their cars.

In the center of the hall the Electric Vehicle Co., Hartford, Conn., displays five vehicles, four of which have one chassis in common. The brougham, landaulet, hansom and Victoria, all of which list $4,000, have a 40 mile radius and a maximum speed of 20 miles per hour. The chassis has a single motor shaft drive and is equipped with three-quarter platform springs in the rear. The battery equipment is 44 Exide cells. A smart Victoria phaeton at $1,000, known as Mark LXIX, Lot 3, is rated with a mileage capability of 68 miles and a maximum speed of 22 miles per hour. This rig has a single chain drive and a battery equipment of 30 cells.

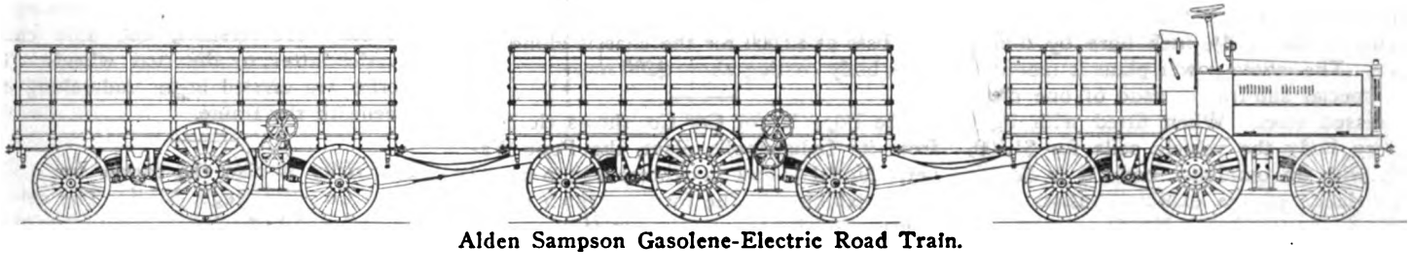
In the Pope-Waverly line, offered by the Pope Motor Car Co., Indianapolis, Ind., the Model 70 C Victoria-coupe with interchangeable bodies is featured. The construction of the body is such that the coupe top may be removed, leaving a Victoria phaeton, to which a leather top may be added if desired. The passenger floor is curved to a low point where the step adjoins, a constructional refinement on which great stress is laid. The vehicle lists at $1,900. Like the regular Victoria phaeton, Model 67, which lists at $1,600, and is also shown, it has one special Pope-Waverly motor designed for double overload and gives a speed of from 5 to 16 miles per hour with a 30 cell battery equipment. Noiseless "herring-bone" gearing, running in oil and protected in dust proof cases, is used. The Model 26 Chelsea, with removable coupe top, at $1,700, and the Model 65 Stanhope with leather top at $1,500, both having the same general running gear specifications as the models previously described, are also shown. A speed of 17 miles an hour is claimed for the Model 71 runabout with leather top, at $1,500, and the Model 69 runabout with leather top at $1,225, as these, while having the same power equipment as the others, bear much lighter bodies. The Model 60 surrey, which is also on the floor, has two motors and 42 cells. With its complement of four passengers it makes 15 miles per hour. Complete with leather extension top, as exhibited, it sells for $1,900.

Three open electrics with tops, together with a 14-passenger omnibus and an ambulance, constitute the non-commercial electric exhibit of the Studebaker Automobile Co., of South Bend, Ind. The Model 16d Victoria-phaeton, with graceful curves and splendid finish leads off. It has a mileage capacity of from 60 to 70 miles on the high speed, the distance, of course, being subject to great increase on the lower speeds. The rate of 15 miles an hour is not at all difficult for it. One special type motor is used, with ample overload capacity, while the battery equipment consists of 28 cells of 11-plate battery, part carried in front and part in the rear, for equal weight distribution. Models 22e and 22a, of the Stanhope type, vary only slightly in body design, and being lighter, match in performance the phaeton as to mileage and speed with a battery equipment of 24 cells. The 14-passenger bus, known as Model 2006e, has two motors of special design, each 80 volts and 20 amperes. The battery equipment is 40 cells in four separate units of 10 cells each. The mileage is between 30 and 40 miles and the speed on good roads from 3 to 10 miles. The vehicle, which weighs 5,500 pounds, accommodates 14 occupants beside the driver.

When the Baker speed roadster, built to look like a gasolene runabout speedster, was disclosed last year it created a buzz of comment as something very radical in the electric line. A similar model is shown this year by the Baker Motor Vehicle Co., of Cleveland. It is styled the Model M roadster and is credited with a speed of 38 miles an hour, and a radius of 70 miles when driven at the lower speeds. It is a long, rakish runabout with rumble seat in the back, holding a total of three passengers when necessary. The battery equipment is 40 cells, 9 P. V. The power from the motor is conveyed through a planetary gear reduction and shaft drive to bevel gears on the rear axle. The speed control is of the continuous torque system, the speed changes being made without sparking. There are nine speeds forward and three reverse, eight of the forward speeds being without resistance. From the first to the fifth speed inclusive the batteries are in parallel, while for the higher speeds they are in series. The speed lever is mounted on the steering wheel. The motor is rated at 3½ horsepower. Ball bearings are liberally used to give high efficiency. The blue of the body together with the yellow running gear give the car a very natty appearance, and it attracts a great deal of attention. The company also has for inspection the Queen Victoria, a popular design for general use or woman's driving. It is capable of 20 miles an hour and has a battery equipment of 24 cells, 9 M. V. The Baker inside driven coupe is likewise shown. It is the same chassis with coupe body, the latter being interchangeable with the Queen Victoria body if desired. The coupe style is recommended for physicians and for winter driving. A demonstration chassis of these two models is featured. It shows the steel frame which is a Baker feature and the control system giving six speeds forward and three reverse.

Another electric speedy roadster is revealed in the space of the General Vehicle Co., of Long Island City, N. Y. It is a racy, gray affair, with a battery equipment

Digitized by Google



of 40 cells and capable of 30 miles an hour. One the lower speeds it has a rated radius of 150 miles. A fancy green runabout seating two is also shown. This can make 18 miles per hour and can go 50 miles on one charge. The same chassis takes a phaeton body. A landaulet, luxurious in every way, is displayed. It can go 60 miles on one charging and can travel at the rate of 15 miles an hour. The battery equipment is 40 cells, and the complete vehicle weighs 3,000 pounds. A feature of the General method of construction is the use of Morse silent chain both for the gear reductions and for the final drive, rather than the employment of any gears.

A clever little canopy top Victoria-effect runabout confronts one at the stand of the Columbus Buggy Co., of Columbus, O. It has a maximum speed of 21 miles an hour and when driven at the more moderate pace of 12 or 13 miles an hour can cover 75 miles without recharging. A single motor is used with double chain drive from a differential countershaft, and 21 cells constitute the baatery equipment. A Victoria and a coupe on the same chassis are offered. The chassis is also shown stripped for demonstration purposes.

For the Babcock roadster, Model 5, exhibited by the Babcock Electric Co., of Buffalo, N. Y., it is claimed that at 16 miles an hour on good, level macadam roads 85 miles can be readily obtained on a single charge of the battery. The maximum speed is 26 miles per hour. The equipment of battery is 36 cells, divided between the front and the back. Five forward speeds and two reverse are given. When fitted with the Victoria phaeton body the speed is reduced to about a 25 mile maximum, but the latter body, because of its low hanging and wide entrance has many advantages for stout and elderly people. Wheel steer is used in both models, the steering column having a breaking joint to permit easy ingress and egress to the operator's seat. The same chassis is also shown fitted with a coupe body. The Model 1, a Stanhope, completes the exhibit. This has a mileage rating of 50 miles for ordinary roads, and a maximum of 18 miles per hour, being equipped with 40 cells.

A Stanhope and a coupe mounted on what is termed their Model 10 chassis are shown by the Rauch & Lang Carriage Co., of Cleveland. The chassis itself is also shown stripped of any body. It has 24 cells, 9 M. V., and can carry either the Stanhope or the coupe at 20 miles an hour. With suitable tires and good roads it is claimed that it can cover almost 100 miles on one charge. A six-passenger landaulet with 24 cells, 17 M. V., is displayed, too. It has a maximum speed of 18 miles per hour, which the manufacturers thing amply high for city driving.

Concerning the Commercial Vehicles

Alden Sampson Gasolene-Electric Road Train.

A round dozen makers staged commercial vehicles and their combined products range from a road train capable of carrying 20 tons cargo, to light wagons built for loads under 1,000 pounds. Two makers exhibit five ton trucks, one gasolene and the other electric, and in the smaller vehicles the two powers divide things about even, the freight train straddling by using both in a combination whereby gasolene generates the primary power and electricity transmits it.

What is described by its makers, the Alden Sampson Mfg. Co., of Pittsfield, Mass., as a "multiple unit road train," is literally the big feature of the commercial section, as it also is interesting from the point of novelty and radical design. It consists of a tractor with two trailers, the tractor mounting an electrical generator for supplying current to the motors individual to the trailers, the whole outfit being operated like the multiple unit system of a subway train, where the operator in front controls the action of not only the first car, but of those that are attached behind. The tarctor itself has six wheels and the trailers, too, have six wheels apiece, three on a side, the center wheel in each case being a drive wheel 54 inchs in diameter with 5-inch steel tires, while the wheels at either end are but 42 inches in diameter, with 3½ inch steel tires. The tractor and two trailers in combination are capable of carrying 20 tons at a rate of 6 miles an hour on level, hard macadam. The power plant of the tractor consists of a slow speed four cylinder motor of about 60 horsepower, driving a direct current generator. The current thus obtained is available for the electric motors operating the drive wheels on the trailers through the medium of connecting cables and when the whole train is in motion the two driving wheels on the tractor and the driving wheels on each of the trailers are all operated by electricity. Each trailer, therefore, has sufficient driving traction for its own load and the tractor is relieved of having to pull the whole mass. There are two motors to each car, a motor to each driving wheel, thus doing away with the need for a differential. The driving wheels are so free and unhampered in their action that they will easily ride over obstructions 12 inches high.

In turning corners the cars track each other practically perfectly and the whole train can make a complete turn in a 20-foot radius. Each car is steered by a tongue attached to the rear of the car ahead of it, the front and rear sets of wheels being cross connected so that in rounding a curve all six wheels follow concentric radii. The cars are 17 feet long by 4 feet 2 inches wide, and stand 4 feet high, weighing 7,000 pounds. The wheel gauge is 72 inches.

The power plant on the tractor makes it possible for the latter to stand still and yet supply power to move a trailer that is quite a distance away from it, if suitable lengths of wire are provided to supply the trailer motor with current from the tractor dynamo. Series-paralleling is accomplished by means of a rotary switch which is interlocked with the one-minute starting hreostat in such a way as to make it impossible for a careless or ignorant operator to cause damage to the electrical equipment. Braking is done by short circuiting the motors, making two magnetic brakes for each car.

The Hewitt Motor Co., New York City, exhibits a 5-ton truck of the most sturdy design. It is equipped with a gasolene motor rated according to the A. L. A. M. formula at 28 horsepower, and having four cylinders of 4¼-inch bore by 5½-inch stroke. The main fuel tank is at the side of the car, from which gasolene is from time to time pumped to the gravity feed tank on the dash. Simms-Bosch high tension magneto ignition is used, without supplementary batteries of any kind. The radiator extending across the front of the wide dashboard has an unique spring suspension mounting to save it from the strains and warpings that it might ordinarily get on the stiff truck. Spiral springs at each side of the dash support it and the arrangement is such that the whole radiator may be taken off with little difficulty.

A shaft with two universal points conveys the power to the cone clutch and planetary transmission. The latter has the usual two speeds forward and a reverse, the

Digitized by Google

drive, of course, being direct on the high speed. The brake bands on the transmission are of fibre. Two universal points are also used on the shaft from the transmission to the differential and the power is conveyed thence to the rear wheels by side chains. The long frame of channel section is of pressed steel, strongly reinforced at the corners. The springs are of the semi-elliptic type and those in the rear have 19 leaves. The rear wheels, which may be supplied with either twin or triple tires, are fitted with internal expansion brakes 24 inches in diameter and with 3-inch faces. There is also another brake on the transmission. Special Timken roller bearings are used for all heavy bearings. The chassis alone lists at $4,500, but equipped with a stake truck body sells for $5,000, a complete truck thus fitted out being shown. The same style of chassis with coal wagon body might be seen the fore part of the week delivering 5 tons at a time to the Madison Square Garden coal chutes.

The standard light Hewitt delivery wagon is also shown. This has a single cylinder motor rated at 12 horsepower, the dimensions being 4½-inch bore by 6-inch stroke. The whole power plant is mounted on a special sub-frame made of one piece of pressed steel. When fitted with light delivery body the vehicle sells for $1,600, while with an omnibus body it is $2,000. The balance of the exhibit consists of a standard four cylinder Hewitt motor and an eight cylinder V type motor for omnibus use, fitted with a special carburetter, guaranteed to give a steady gas supply to all eight cylinders, and a special eight lead distributor.

The 5-ton electric truck is shown by the General Vehicle Co., of Long Island City, N. Y. It has a single motor and uses Morse silent chain for the first reduction to the countershaft and differential, thus avoiding the use of gears. The motor is ball bearing and Timken roller bearings are used for the countershaft and wheels. Side chain drive is employed from the differential countershaft. The truck is capable of about 25 miles on a charge and the speed is in the neighborhood of 6 miles an hour. The beer truck style, as shown, lists at $4,500. A 3½-ton truck, with the same general principles of construction, is exhibited by the same makers. It is capable of 8 miles an hour and is good for 30 miles. The price for this style is $4,000. The 1,000 pound wagon completes the commercial exhibit of the company. It lists at $2,200 and can make 40 to 50 miles, its maximum speed being 12 miles per hour.

Two styles of wagons were shown by the Knox Automobile Co., of Springfield, Mass., the first being a 30 horsepower 3-ton truck with a four cylinder air cooled motor, three speed selective transmission, double chain drive, and rear wheels equipped with twin tires. Complete with Boston brewer's body it lists at $4,200. The 1½-ton truck, with two cylinder air cooled motor rated at 16-20 horsepower, has planetary transmission and lists at $2,600 for the chassis alone, an open body costing about $200 more.

The Pope Motor Car Co. shows electrics from its Indianapolis plant, the Pope-Waverly Model 43 and an express wagon model being exhibited. The former, which is the lighter model, has a single motor suspended from the frame and uses a double chain drive from a countershaft fitted with differential. It carries 42 cells for battery equipment. With an open body it lists at $1,800, and with a closed body at $1,850. The express wagon type has a double motor and is of about double the power. It uses double chain drive from a differential countershaft, like the other model, but differs from it in that semi-elliptic springs and plain bearings are used instead of full elliptic springs and ball bearings. Its price is $2,500, complete with the express wagon type of body with top.

A single Franklin truck is displayed, this being the 16 horsepower stake truck with four cylinder air cooled engine and spiral gear drive. The vehicle lists at $2,000, the manufacturers being the H. H. Franklin Mfg. Co., of Syracuse, N. Y.

The Cadillac light delivery car at $1,000, with a single cylinder 10 horsepower motor occupies the downstairs space of the Cadillac Motor Car Co., of Detroit, Mich. The vehicle has a covered body and has a carrying capacity of from 500 to 600 pounds.

The commercial chassis of the Baker Electric Co., of Cleveland, O., capable of taking a variety of bodies, is shown fitted as a police patrol wagon. The complete chassis with 42 battery cells, 9 MV in series at all speeds, weighs 3,000 pounds. The frame is of pressed steel, which is something of a departure in electrics. Renold silent chain is used from the motor to the differential countershaft, and side chains from the latter to the rear wheels. The batteries are carried in an underslung cra dle beneath the frame.

Electricity is also the power for a neat Wagon Co., of Owego, N. Y. The vehicle, with enclosed body, has a carrying capacity of 750 pounds and can go 35 miles on one charge. It has a single motor equipment and a triple linked spring suspension.

While making no exhibit of commercial vehicles, the Packard Motor Car Co., of Detroit, Mich., has a large space in the commercial vehicle section where a factory expert is ready to figure with those interested as to the use of the Packard commercial chassis. The company is prepared to supply a great variety of bodies.

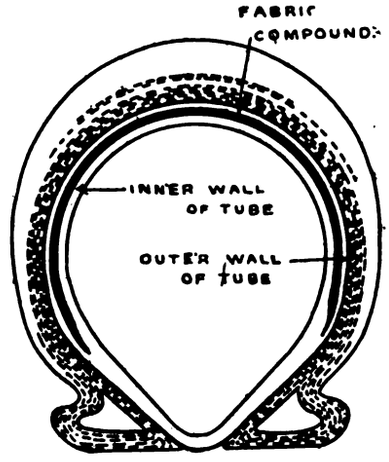
In the Realm of Tires and Accessories

Between the closing of the Palace show on Thursday night and the opening of the Garden show on Saturday, forty-five hours later, it scarcely was to be expected that those exhibiting in the first show would display anything new in the other show which so closely followed. Perforce, so far as accessories are concerned the Palace funtion took much of "the shine off" the second, but, as a matter of course, practically all of the better known accessory manufacturers were "present and voting" at both shows, as, for instance, the Diamond Rubber Co., Morgan & Wright, G & J Tire Co., Continental Caoutchouc Co., Goodyear Tire & Rubber Co., Hartford Rubber Works Co., Fisk Rubber Co., Ajax-Grieb Rubber Co., Firestone Tire & Rubber Co., and the Michelin Tire Co., and, of course, there are Midgley rims, Timken axles and bearings, Whitney chains, and Truffault-Hartford shock absorbers, and Solar lamps, and the Jones, Warner, Smith and Index speed indicators, Splitdorf, Witherbee, Heinze and Pittsfield ignition apparatus, and all of the well known products that contribute to the satisfaction of automobile usage.

But despite the fact, there are installed at the Garden not less than eighty-one accessory exhibitors who did not display their goods at the former, and it is among them that any newness must be looked for.

Two entirely new products appear in the exhibit of the Jones Speedometer, of New York, in addition to the regular line of Jones Speedometers. The first is the automatic speed regulator, having a dial arrangement which may be placed in the tonneau while the speed indicator part is on the dash of the car. The dial may be set for almost any maximum speed, and when that speed is reached the device automatically prevents the car going faster, by cutting out the spark or controlling the throttle. A new recording instrument, christened the "speedograph," is the other novelty. When put out in perfected form it will give graphic records of time, distance and speed on disc records of paper.

Each year the Garden show offers the opportunity for the Splitdorf Laboratory, New York, to bring out its new discoveries and always something new may be expected from it. This year the "something new" is a four cylinder unit coil with one synchronizing vibrator for the four coils, insuring an absolute correct timing of the ignition. The vibrator is of the high speed type, consuming a quarter of an ampere; these coils are also equipped with an aux-



Digitized by Google

iliary condenser in each unit, whose sole purpose is to absorb the spark or arc which is ever a menace to the commutator. This will be appreciated, especially as it is estimated that 90 per cent. of the ignition troubles are due to the destruction of the contacts in the commutator. The speed of the synchronizer is due to the short magnets which are employed in series with the primaries of the other units in operating the armature, and as a special unit is reserved for this vibrator a sufficient amount of condenser is supplied in this unit which will take care of any possible spark between the platinum points of the vibrator.

In addition to the Eiseman magneto and imported parts, of particular interest at this time, when the taxicab is very much in the public eye, not alone of the automobile manufacturers, but of those in the transit methods generally, is one of the exhibits of Lavalette & Co., of New York, who are showing an absolutely new taximeter for use on both motor cars and other wheeled vehicles. It is designed, of course, for use in indicating the amount of fare to be collected at the end of performed service. In outward appearance it is much like a small steel cash box, black, with a gold stripe; it is about 9 inches high, 5 inches wide and 7 deep; the front of glass permits a view of a silvered dial bearing indexes of the tariff—i. e., day or night use—fare in dollars and cents, also an index for "extras," by which is intended the baggage charges. operated at the vehicle by the gears of the same general type as used in speedometers. The connection to the taximeter is through a flexible shaft. On the side of the meter a small red metal flag indicates by its position if the car is engaged or is for hire, a perpendicular position indicating it is for hire; dropped or horizontal, that it is engaged. On the same side a small T handle is for the purpose of winding the clock work, which is started automatically when the vehicle is waiting the return of the passenger who has engaged it. In the event of a delay for which the fare is not responsible, a break or puncture, a lever on the same side as the other mechanism is thrown forward, showing a dial indication of "not recording." On the back is a series of indicator dials or wheels not unlike the appearance of an odometer, which show the total number of fares carried during a certain period of time, the number of miles traveled and the amount collected. The registration of "extras" is controlled by a push button arranged on the back.

A high tension magneto in which the primary circuit is automatically broken by the use of the magnetic force is the principal feature of the Albert Champion Co. exhibit. In this magneto the primary contact breaker has also the advantage of acting as an automatic cutout. When the armature has reached a certain speed it controls the high tension and makes it constant, the primary break in magneto fields acts as an automatic blow-out, eliminating arcing between the points of the primary breakers. In the distribution of the current there is no 2 to 1 shaft used, its place being taken by an internal gear in connection with a floating gear. A wide range of speed with spark advance is controlled by a shutter which displaces the magneto field between the armature and pole-pieces.

In respect to tires, the Dow non-deflation inner tube undoubtedly is the greatest novelty. It previously had been seen by many men in the trade and some of those in the Association of Licensed Automobile Manufacturers thought so well of it that they have been more or less indirectly exploiting it. At the Garden it is shown in improved form.

Dow Non-Deflation Inner Tube.

The Dow inner tube may be described as a tube within a tube. Considering the smaller diameter, the contained tube is vulcanized to its casing for about one-quarter of the diameter, the rest of it forming a pocket which is filled with a compound of paste and selected feathers. Inserted in a shoe in the same manner as the ordinary tube, it is inflated in the usual manner; the outward appearance is conventional. When the inevitable puncture occurs the feather compound finds the opening, seals it without appreciable loss of air and the puncture ceases to exist. With the pressure maintained in the tube the life of a shoe, which is always shortened if run soft, is necessarily lengthened by being used in the condition for which it was constructed, the probability of blow-outs becomes remote and as the tube construction does not subtract from the resiliency of the tire one obtains the maximum mileage with minimum trouble and expense.

The makers of the Kelly-Springfield tire bounce into the ring at the Garden show as makers of pneumatics. The Consolidated Rubber Tire Co., of New York, shows the new Kelly-Springfield pneumatic tires in a great variety of sizes. The new tires are regular type clinchers, with raised corrugated tread.

Holley Bros. Co. radically have changed their 1908 Holley carburetter, both in design and principle; it now constitutes a departure from the conventional designs of carburetter. A high air velocity is obtained in the mixing chamber by applying the principle of the Venturi tube, which feature, though not original in this carburetter, is important, for the reason that frequently is incorrectly applied. The true Venturi tube acts to discharge a liquid or gas with a velocity through the smallest section of the tube greater than the velocity due to the head alone. In the new Holley carburetter the gasolene level in the float chamber, instead of being slightly below the gasolene orifice, is about one-eighth inch higher, and it is in this fact that the radical departure lies. In some carburetters it is necessary to lift the gasolene by vacuum to produce a mixture, and at slow speeds the suction to accomplish this is lacking; in the new model there is a puddle one-eighth inch deep in the bottom of the chamber when the motor is at rest. Consequently when the motor is starting or running very slowly, the air does not have to lift the gasolene at all, but draws over the puddle and is carburetted by surface evaporation. As the throttle is opened and the air velocity increases, the puddle gradually is swept away by the strong air current over it, thus reducing the surface area of the puddle, and maintaining constant proportions of mixture. At the higher speeds the puddle is wiped out entirely and a spray of the ordinary sort takes place. Another feature claimed for the new model is that it has but one adjustment, all of it being made through the needle valve. At a slight additional cost the needle valve is fitted with a universal joint from which a small rod may be run through the dashboard, thus permitting adjustment from the seat while the engine is in motion.

R. E. Hardy & Co., whose Sta-Rite spark plugs are too widely known to require description, has brought out what is termed a magneto plug. In general construction the plug embodies the same principle as all Sta-Rite products, with a shell separable for cleaning and the porcelain protected by a metal cap, but it differs from the others in that it has a center sparking point of thick nickel, with four ground wires, the claim being made that this arrangement eliminates any chance of burning out the contact points, as the heat from the spark is equally distributed. The Stackpole Battery Co., St Mary's Pa., shows an assortment of dry cells and battery connections. In addition to its batteries, the Vesta Accumulator, Chicago, exhibits a line of electric horns, operated by push button from the steering wheel.

The Leavitt distributor, marketed by the Uncas Specialty Co., has been improved to some extent, and a new model of the Leavitt siren horn, with an eight-inch bell, also has made its appearance. Janney, Steinmetz &

Digitized by Google

Co., Philadelphia, have found improvement impossible in their large line of seamless cold drawn steel tanks, and that company still is marketing the Hill gasolene lock, the Lowndes duplex pipe wrench, and Richards' aluminum solder; the only new article the firm has to show is the "Flash Light" spark plug, with platinum iridium tips, in a variety of sizes, and at a popular price.

Two improvements are manifest in the Kilgore pneumatic shock eliminator, the most important being a change in the adjustment of the working cylinder proper. In last year's device eight small by-pass holes lined one side of the cylinder, but when after exhaustive tests it was found that the presence of so many holes did not afford sufficient resistance, six of the holes were done away with, leaving one each near the top and the bottom. Arguto wood piston rings have been substituted instead of steel rings. Originally wood was employed, and later steel, but the latter material was found to scratch the brass cylinder to an unnecessary degree, and this brought about a return to arguto wood.

Making the parts of a product that manufacturers either have not the facilities for making or do not care to make is the business of the Globe Machine & Stamping Co., Cleveland, which shows a comprehensive array of band brakes, brake drums, gear cases and stampings of all sorts. The company this year is making steel battery and tool boxes, that are unique, a wood lining having the effect of strengthening as well as rendering them practically noiseless when filled with either batteries or tools. The Radio-Escape, invented by Walter C. Baker, is another new product. It merely is a device to be applied to any radiator, and consists in sealing the radiator by closing the overflow, and screwing on the divice in place of the cap at the top. The claim is advanced that in winter it retains the vapor from the anti-freezing liquid within the radiator, necessitating refilling only after long service; while in summer the radiator can be filled with rain or distilled water, which does not produce tube-clogging lime scale, and the same water retained throughout the entire season.

Increased accessibility denotes the change in the Hill precision oilers, shown by the Precision Appliance Co., Chicago. On the new model oiler all the working parts are mounted on the cover and are removable with it, thereby making inspection of the working parts possible without removing the oil from the tank, a feature simplicity in itself. Apropos of lubrication, William C. Robinson & Sons Co. are represented with a large display of oils and greases, as also is Orlando W. Young and Adam Cook's Sons, the last named with its time-tried Albany grease. Young has concocted one new light oil and is showing the Cox vulcanizing clamp, so called, consisting of two metal clamps padded with felt, an instrument devised to hasten and make perfect patch repairs to inner tubes. The repaired tube is placed between the two felt-lined plates and the clamps screwed down. The felt, being soft, gives way at the thick portion of the patch and thus exerts an even pressure on the whole, making a quicker, easier and safer repair than by the old style method of pressure from the hand until the solution takes hold.

A small but very important change has been wrought in the Barrett automobile jack, manufactured by the Duff Mfg. Co., Pittsburg, Pa. Until this year the eccentric, or thumb screw, which reversed the movement, was contained at the side, which made manipulation difficult when the jack was in place under a wheel. The reversing lever now is in front of the frame alongside the operating lever and can be thrown up or down and thus reverses the movement without reaching in between the spokes of the wheel. Four new models are shown, the most striking an eight inch jack with a five inch raise, and a single acting jack for trucks. Cook's Standard Tool Co., Kalamazoo, Mich., also show the Standard jacks is a variety of sizes.

In addition to its electric speed indicator and rotary pumps, the Lipman Mfg. Co. has on its stand an electric odometer, without shaft, a dash board gasolene guage, and a special timer for Ford runabouts, all of which are new this season. The dashboard gasolene guage is a compact instrument with a scale denoting fifteen inches, and consists of a copper tube to be placed in the gasolene tank when it is desired to know the amount of fluid in the tank. The pressure of the fluid in the tank forces a colored liquid in the bottom reservoir of the instrument up a scale tube on the face of the dial, recording up to fifteen inches. The Hoffecker Co., of Boston, shows the Hoffecker speed indicator, and the Webb Mrfg. Co., Newark, N. J., has an interesting exhibit of various kinds and sizes of flexible shafting, as used in many of the well known speed indicators on the market to-day. A gasolene indicator, for dashboard use, is exhibited by the Edmund E. Hans Co., of Minneapalis.

The Comstock shock absorber, which is designed to be placed on a car at an angle of 45 degrees, is about the only one of that numerous family not exhibited at the previous show. It is of the hydraulic tribe. The chamber is filled with oil until the time of impact when the piston is depressed, forcing the oil through a recoil valve into the space behind the piston. At the point of greater depression the valve is unseated in which way care is taken of the spring recoil, allowing only a gradual resumption of the normal position of the spring, obviating the possibility of a break and preventing the personal discomfort of the shock or jar to the passengers.

To obtain a metal not heavier than aluminum, but with greater tensile strength, to retain the rough surface so that a finish easily may be given by the painters, to have the rigidity of steel and anti-rust qualities of the lighter metal, were some of the problems claimed to have been solved by the American Aluminum Coating Co., of Pittsburg, Pa., the result of their research in an exhibit of aluminum coated sheets, to be used for radiators, mud guards, panels for metal bodies, etc. Using a steel base, electrolysis is employed to coat it with aluminum or to plate it as one would obtain gold or silver plating. The surface of the coated steel not having the high polish that is given to pure aluminum sheets, it is unnecessary to rough or scarf it to enable the painters to apply a lasting coat of paint, and the greater strength of the steel base permits the use of a much lighter guage metal which about equalizes the weight with pure aluminum.

In respect to design, material, workmanship and finish of such commonplace articles as grease guns and gasolene primers, it would be difficult to excel those shown by the Randall-Faichney Co., of Boston. The firm is famous for their surgical instruments. They have shown the same care in the production of the tools that is found in their instruments. The novelty of the guns and primers is in the piston construction which employs solid brass without recourse to cork, leather, or rubber gaskets. The piston is ground to fit the cylinder and does so so perfectly that leakage behind it is impossible. The tips are made of seamless brass tubing, precluding the possibility of "joint leaks."

Some day it may be that bearings will have reached a stage of development when new designs will cease. That this time has not come is shown by the principal feature of the New Departure Mfg. Co., Bristol, Conn., whose exhibit is chiefly of an annular ball bearing that takes an end thrust and radial load, with twice the strength and double the load capacity. It is, in fact, two bearings in one. Two rows of balls with separator holding the balls in place, the rows being staggered, this separator performs no other function than to maintain the position of the balls; it does not in any way participate in the load carrying work of the bearing. The cone is a single grooved piece of steel and the raceways for the balls are in two pieces. When assembled the raceways, cones and balls fit into a case and are held in position by the edge of the case being spun over. The bearings are supplied in standard sizes in diameters and bore.

With some refinements in the Perfect Speed Indicator, shown in the basement of the Garden by S. Smith & Son, Ltd., they offer a novelty which they call the "Tourists' Companion," consisting in addition to the speed indicator of an eight day watch, barometer and compass, the whole mounted in compact form on a brass base, each instrument of sufficient size to be readily

Digitized by Google

read from the seat. At first thought the use of a barometer and compass is not readily determined, but when one remembers the road book directions of E. NE. or South, and realizes how few people can keep their bearings in mind, the use of the compass is apparent, and many a cautious person, with the occasional rheumatic tendencies and past experience in tire repairs on a rainy roadside, will accept an unfavorable barometer reading as a direct reason for postponing an all day trip. This firm is showing also the "Perfect Duplex or Double Speed Indicator," to be placed in the limousine where it will indicate to the occupant a duplicate reading of the dash instrument. Constructed with a clock, season and trip odometer, with speed indicator and maximum hand is gives absolute knowledge of the pace of the car from the limousine seat. A communicating device within easy reach permits of a signal for more or less speed and in all ways the action of the chauffeur may be directed by the electric signal.

With a combination of three mechanical powers, the wedge, the screw and the nut, though in only two parts, a device for absolutely fastening automatically both the nut and bolt, constitute the exhibit of the Columbia Nut and Bolt Co., of Bridgeport, Conn. While this device has met with a very general acceptance in the railroad world, its adoption by the automobile industry has been sufficiently slow to be a cause of wonder. Realizing, as all practical automobilists must and do, the immense damage a floating bolt or nut can accomplish, not alone in a crank or transmission case, but on any part of a moving car, it is difficult to know why an inexpensive contrivance that will not slack back or work loose, that is easily adjusted and may be used on any car without change in its standard equipment, has not been universally adopted. The principal of the nut, for such is the designation of the whole thing, is a device consisting of an inner and outer part, which when assembled are a unit. The inner nut, which is threaded to receive the bolt, is slotted throughout its length and is tapered from above downward to fit and correspond with the toper of the outward or binding nut. By applying the wrench and tightening the nut in the usual way the nut working on the taper binds the bolt without dependence on a lateral strain to hold it in place. Though readily removed, it will not of itself work loose and its general adoption in the automobile trade where already many cars have accepted it, is surely a matter of but a short time.

The Ball trunnion suspension, which is exploited by the A. Z. Co., New York, is offered as a solution of the problem of relieving the lateral strain to which radiators are subjected when the going is rough. In the A-Z constructive method, a ball is fastened securely to each side of the radiator, near the bottom. A sliding bushing is recessed to fit the ball and its outside is turned to fit and rest in the support which is attached to the chassis. The ball in its socket permits of any twisting of the car frame, and the bushings allow for its spreading. The strain it is claimed is thereby entirely removed from the radiator which retains its normal relation to the engine by means of the rubber water line connection. Another contrivance also designed to relieve tanks or liquid carriers from strain is a cradle in which the force tank is carried without connection from it to the car save by the gasolene line.

Users of storage batteries frequently have cause to complain of the way in which acid deposits on the outside of the case corrode the terminals and connections to the serious detriment of the latter's contact efficiency. To render this corrosion impossible, The Kitsee Storage Battery Co., Scranton, Pa., exhibit cells with connections of burnt lead which is non-corroding. To the same end they are using brass binding screws which also are lead covered, while hollow tube vent caps minimize the chances of acid being spilled out by the car vibration.

In the storage batteries of Peerless Ignition Co., Brooklyn, N. Y., is disclosed a sealing compound to prevent acid leaks with their consequent corrosion, and as a further prevention of the latter the lead terminals are extended to the top of the jar. Rubber is used in the construction of the jars which are not of the compartment type. All rubber separators, both corrugated and fine perforated flat sheets, are used between the plates, the former for preventing short circuiting, the latter to keep all material intact.

THE EXHIBITORS AND THE WARES THEY EXHIBITED.

AUTOMOBILES.

Alden, Sampson Mfg. Co., Pittsfield, Mass.—One gasolene-electric tractor and two electric trailers.

Anderson Carriage Co., Detroit, Detroit electric cars—One coupe and one runabout.

Apperson Bros. Automobile Co., Kokomo, Ind., Apperson gasolene cars—Two 4-cylinder touring cars, one 4-cylinder limousine, one 4-cylinder roadster and one 6-cylinder roadster.

Autocar Co., Ardmore, Pa., Autocar gasolene cars—One 2-cylinder runabout, one 4-cylinder roadster, one 4-cylinder limousine, one 4-cylinder touring car and one 4-cylinder chassis.

Babcock Electric Carriage Co., Buffalo, Babcock electric cars—Three electric runabouts and one coupe.

Buick Motor Co., Flint, Mich., Buick gasolene cars—Two 4-cylinder chassis, one 2-cylinder touring car, two 4-cylinder roadsters, and two 4-cylinder touring cars.

Baker Motor Vehicle Co., Cleveland, Baker electric cars—One chassis, one roadster, one enclosed cab, one brougham, one runabout, one enclosed coupe, and one patrol wagon.

Cadillac Motor Car Co., Detroit, Cadillac gasolene cars—One 1-cylinder light delivery wagon, one 4-cylinder chassis, two 4-cylinder touring cars, one 4-cylinder limousine, one 4-cylinder roadster, one 1-cylinder runabout, one 1-cylinder touring car, and one 1-cylinder coupe.

Champion Wagon Co., Owego, N. Y., Champion electric commercial cars—One electric delivery wagon.

Columbus Buggy Co., Columbus, Ohio, Columbus electric cars—One chassis, one coupe, and two runabouts.

Corbin Motor Vehicle Corporation, New Britain, Conn., Corbin gasolene cars—One 4-cylinder air-cooled runabout racer, one 4-cylinder air-cooled roadster, one 4-cylinder water cooled chassis, one 4-ccylinder water cooled touring car, and one 4-cylinder air cooled model engine.

Electric Vehicle Co., Hartford, Conn., Columbia gasolene and electric cars—Two 4-cylinder touring cars, two 4-cylinder limousines, one 4-cylinder chassis, one 4-cylinder roadster, two electric enclosed carriages, one electric buggy, and one electric hansom.

Elmore Mfg. Co., Clyde, Ohio, Elmore gasolene cars—One 4-cylinder roadster, one 4-cylinder chassis, and two 4-cylinder touring cars.

Franklin Mfg. Co., Syracuse, N. Y.—One 4-cylinder runabout, one 4-cylinder model engine; one 4-cylinder landaulet, one 4-cylinder taxicab, two 4-cylinder touring cars, one 6-cylinder touring car, one 4-cylinder roadster, and one 4-cylinder 2,000 pound truck—all air cooled.

General Vehicle Co., Long Island City, N. Y., General Electric cars—One roadster, two runabouts, one limousine, two trucks, and one delivery wagon.

Haynes Automobile Co., Kokomo, Ind., Haynes gasolene cars—Five 4-cylinder touring cars.

Hewitt Motor Co., New York City, Hewitt gasolene commercial vehicles—One 4-cylinder chassis, one 4-cylinder 5-ton truck, one 1-cylinder light delivery wagon, and one 1-cylinder small omnibus.

Knox Automobile Co., Springfield, Mass., Knox gasolene cars—One 4-cylinder water cooled touring car, one 4-cylinder air cooled limousine, one 4-cylinder air cooled roadster, one 4-cylinder air cooled chassis, two 4-cylinder air cooled touring cars, one 2-cylinder air cooled 1½-ton truck, and one 4-cylinder air cooled 6,000 pound truck.

Locomobile Co. of America, Bridgeport, Conn., Locomobile gasolene cars—One 4-cylinder limousine, one 4-cylinder chassis, two 4-cylinder touring cars, one 4-cylinder roadster, and two 4-cylinder touring cars.

Lozier Motor Co., Plattsburgh, N. Y., Lozier gasolene cars—One 6-cylinder limousine, one 6-cylinder touring car, one 4-cylinder touring car, one 4-cylinder chassis, and one 4-cylinder model engine.

Matheson Motor Car Co., Wilkes-Barre, Pa., Matheson gasolene cars—One 4-cylin-

der chassis, one 4-cylinder limousine, one 4-cylinder roadster, one 4-cylinder touring car, and one 4-cylinder demi-limousine.

Northern Motor Car Co., Detroit, Northern gasolene cars—One 2-cylinder touring car, one 2-cylinder limousine, one 2-cylinder chassis, and one 2-cylinder roadster.

Olds Motor Works, Lansing, Mich., Oldsmobile gasolene cars—One 4-cylinder roadster, one 6-cylinder touring car, two 4-cylinder touring cars, one 4-cylinder limousine, and one 4-cylinder chassis.

Packard Motor Car Co., Detroit, Packard gasolene cars—One 4-cylinder chassis, one 4-cylinder roadster, one 4-cylinder touring car, and one 4-cylinder limousine.

Peerless Motor Car Co., Cleveland, Peerless gasolene cars—One 6-cylinder model engine, one 6-cylinder touring car, one 4-cylinder touring car, one 4-cylinder chassis, one 4-cylinder roadster, and one 4-cylinder limousine.

Pierce Co., Geo. N., Buffalo, Pierce Great Arrow gasolene cars—One 6-cylinder chassis, one 4-cylinder semi-limousine, one 4 cylinder limousine, and two 6-cylinder touring cars.

Pope Mfg. Co., Hartford, Conn., Pope-Hartford gasolene cars—One 4-cylinder limousine, one 4-cylinder runabout, four 4-cylinder touring cars, one 4-cylinder roadster.

Pope Motor Car Co., Indianapolis, Pope-Waverly electric cars—Five runabouts, two enclosed coupes, one touring car and three delivery wagons.

Pope Motor Car Co., Toledo, Pope-Toledo gasolene cars—One 4-cylinder model engine, one 4-cylinder roadster, one 4-cylinder colonial limousine, one 4-cylinder limousine, and two 4-cylinder touring cars.

Rauch & Lang, Cleveland, R. & L electric cars—One chassis, one enclosed doctor's carriage and one limousine.

Royal Motor Car Co., Cleveland, Royal Tourist gasolene cars—One 4-cylinder chassis, one 4-cylinder touring car, and one 4-cylinder limousine.

Selden Motor Vehicle Co., Rochester, N. Y., Selden gasolene cars—Two 4-cylinder chassis, and one 4-cylinder touring car.

Simplex Automobile Co., New York City, Simplex gasolene cars—One 4-cylinder chassis, and one 4-cylinder touring car.

F. B. Stearns Co., Cleveland, Stearns gasolene cars—One 4-cylinder chassis, one 4-cylinder touring car, and one 6-cylinder roadster.

Stevens-Duryea Co., Chicopee Falls, Mass., Stevens-Duryea gasolene cars—Two 6-cylinder touring cars, one 6-cylinder chassis, one 6-cylinder limousine, and one 4-cylinder touring car.

Studebaker Automobile Co., South Bend, Ind., Studebaker gasolene and electric cars—Three electric runabouts, two electric commercial cars, one electric chassis, one electric truck, one electric delivery wagon, two 4-cylinder touring cars, one 4-cylinder chassis, one 4-cylinder roadster, and one 4-cylinder limousine.

E. R. Thomas Motor Co., Buffalo and Detroit, Thomas gasolene cars—One 6-cylinder touring car, two 4-cylinder touring cars, three 4-cylinder limousines, one 4-cylinder taxicab, and two 4-cylinder chassis.

Walter Automobile Co., Trenton, N. J., Walter gasolene cars—One 4-cylinder chassis, one 4-cylinder limousine, one 4-cylinder roadster, one 4-cylinder touring car, and one 4-cylinder demi-limousine.

Waltham Mfg. Co., Waltham, Mass., Waltham-Orient gasolene cars—One 4-cylinder air cooled runabout, one 1-cylinder air cooled runabout, one 2-cylinder water cooled runabout, one 2-cylinder water cooled roadster, and one 2-cylinder combination democrat and delivery wagon.

White Company, Cleveland, White steam cars—One runabout, two touring cars, and two limousines.

Winton Motor Carriage Co., Cleveland, Winton gasolene cars—One 6-cylinder chassis, one 6-cylinder roadster, one 6-cylinder touring car, and one 6-cylinder limousine.

Woods Motor Vehicle Co., Chicago, Woods electric cars—Three runabouts and one coupe.

TIRES, PARTS AND ACCESSORY EXHIBITS.

Atwater-Kent Mfg. Works, Philadelphia—Igniters and timers.

Autocoil Co., The, Jersey City, N. J.—Coils and ignition specialties.

Auto Pump Co., The, Springville, N. Y.—Pumps and specialties.

American Ball Bearing Co., Cleveland—Ball bearings.

American Electrical Novelty and Mfg. Co., New York City—Ever Ready batteries, lamps and tire specialties.

Auto Improvement Co., New York City—Self-starters and specialties.

Auto Accessories Mfg. Co., Detroit, Mich.—Tops, tire jackets and specialties.

American and British Mfg. Cd., Bridgeport, Conn.—Frames, motors, axles and parts.

Ajax-Grieb Rubber Co., New York City—Ajax automobile tires.

Aurora Automatic Machinery Co., Aurora, Ill.—Thor motors and components.

Avery Portable Lighting Co., Milwaukee, Wis.—Gas tanks.

Acetyvone Co., Niagara Falls, N. Y.—Carbide and lamps.

A. Z. Co., The, New York City—Hoods, radiators, tanks, etc.

Allers & Co., H. A., New York City—Metal polishes.

American Motor Co., Brockton, Mass.—M-M motor-cycles.

Auto Supply Mfg. Co., Brooklyn—Horns, tubing and brass specialties.

American Aluminum Coating Co., Pittsburg—Aluminum coated steels.

Allen Auto Specialty Co., New York City—Tire jackets and specialties.

Automobile Utilities Co., Boston—Supplies.

Aluminum Solder and Refining Co., New York City—Solder.

Briscoe Mfg. Co., Detroit—Hoods, tanks, radiators, etc.

Bosch, N. Y., Inc., Robert, New York City—Sims-Bosch magnetos.

Blue Ribbon Auto and Carriage Co., Bridgeport, Conn.—Bodies.

Bicycling World Co., The, New York City.

Benford, E. M.

Breeze Carburetter Co., Newark, N. J.—Breeze carburetters.

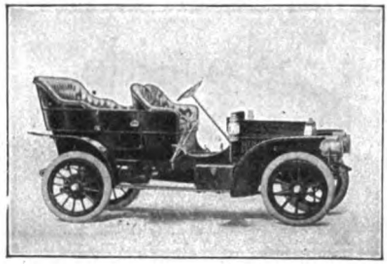
The Week's Patents.

864,111. Carburetter. Frank W. Sickles, Hartford, Conn. Filed Nov. 9, 1906. Serial No. 342,709.

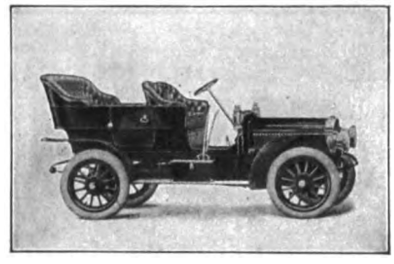
1. A carburetter comprising an annular axially vertical receptacle having a central upwardly open passage therethrough, and having a tube vertically and centrally disposed within said passage open at top and bottom, a nozzle tube centrally within, and separated from the walls of, said tube, and a valve provided way leading from the annular receptacle to said nozzle tube, a cylindrical enlarged casing provided above the receptacle and to center of which said central opening in the receptacle communicates, and having a tangentially located conduit leading therefrom towards the cylinder, an axially vertical rotary.

864,135. Spark Plug. Charles A. Mezger, New York, N. Y. Filed Dec. 26, 1906. Serial No. 349,505.



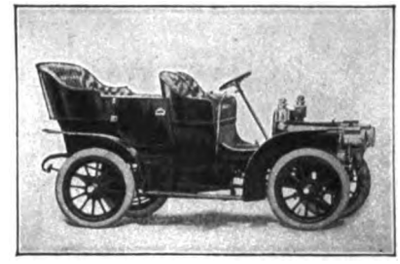
1. In a spark plug, a shell or body, an insulation member therein with an annular enlargement, a bushing screwing into the shell and surrounding the insulation member and an annulus of relatively soft metal surrounding the insulation member at said enlarged portion, the annulus having its edges beveled in the same direction, one of such edges engaging the enlargement of the insulation and the other edge being engaged by the bushing, whereby when the bushing is screwed home, the annulus is caused to expand against the enlarged portion of the insulation and to contract against the main portion of the insulation.

864,243. Variable Speed and Reversing Gear. William S. Hovey, Three Rivers, Mich., assignor to Sheffield Car Company, Three Rivers, Mich. Filed Aug. 4, 1905. Serial No. 272,701.



1. The combination with a suitable frame of a driving shaft; a sleeve revolubly mounted thereon; a gear secured to said driving shaft; a gear secured to said sleeve; a main drum or casing; a set of connected planetary gears, two of which are arranged to mesh with said gears on said driving shaft and sleeve; a spindle therefor carried by said main drum; an auxiliary drum or casing revolubly mounted on said sleeve; a gear revolubly mounted on said sleeve, secured to said auxiliary drum, and arranged to mesh with one of said planetary gears; means for locking said drums against rotation; a friction plate carried by said driving shaft, arranged to engage said main drum for locking the same to said driving shaft; a sprocket wheel; a driven shaft on which said sprocket wheel is mounted; a gear on said driven shaft; a pair of gears revolubly mounted on said sleeve and driving shaft, said gears having inwardly projecting clutch jaws thereon; a jawed clutch collar slidably secured to said sleeve, adapted to engage the jaws on said gear; and means for shifting said collar, for the purpose specified.

864,258. Power Transmission Mechanism. Carlton R. Radcliffe, New York, N. Y., assignor, by direct and mesne assignments, to International Patent Corporation, Jersey City, N. J., a Corporation of South Dakota. Filed June 24, 1905, Serial No. 266,767. Renewed July 18, 1907. Serial No. 284,413.



1. In a planetary gear system, a driving member, a driven member, a sun gear, a secondary sun gear, planetary gears ar-

ranged to mesh with both of said sun gears, and means of shifting one of said sun gears and bringing it into engagement with the other sun gear, and co-operating brake mechanism.

864,313. Explosive Engine. John J. Leary, Rochester, N. Y., assignor to Rochester Gas Engine Company, Rochester, N. Y., a Corporation of New York. Filed Sept. 25, 1906. Serial No. 336,167.

1. In an explosive engine, means for preventing the passage of gases through the bearings, comprising bearing caps, V-shaped grooves one half of the groove being formed in said caps and the other half in the engine body and together forming inverted V-shaped semi-circular grooves, packing in said groove and means for compressing said packing.

The Highest Standard of Efficiency Ever Offered In Any Commercial Rubber Tire At Any Price

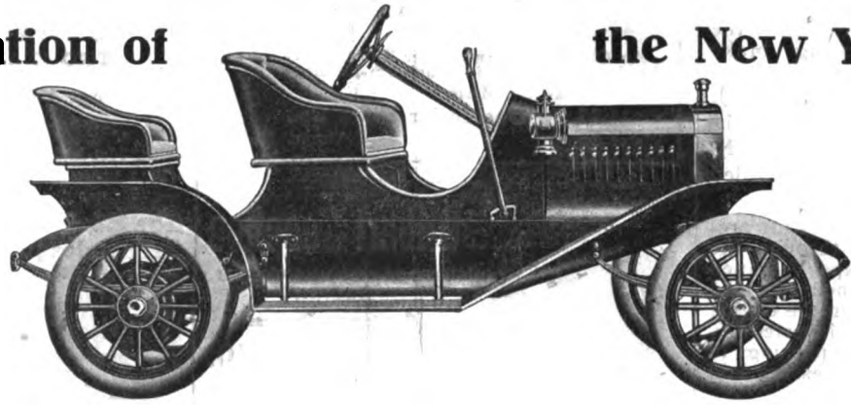
Hartford Solid Motor Tires are absolutely protected from rust by the method of fastening them to the rims.

Hartford Solid Motor Tires are fastened in place by longitudinal wires imbedded and vulcanized in the body of the tire itself.

Hartford Solid Motor Tire retaining wires never come in contact with the moisture from the streets—hence

Hartford Solid Motor Tires are absolutely water-proof and are never affected by rust.

Hartford Solid Motor Tires are held in place by compression and in addition are clamped into position by side flanges—hence



Hartford Solid Motor Tires Never creep.

The Sensation of the New York Show

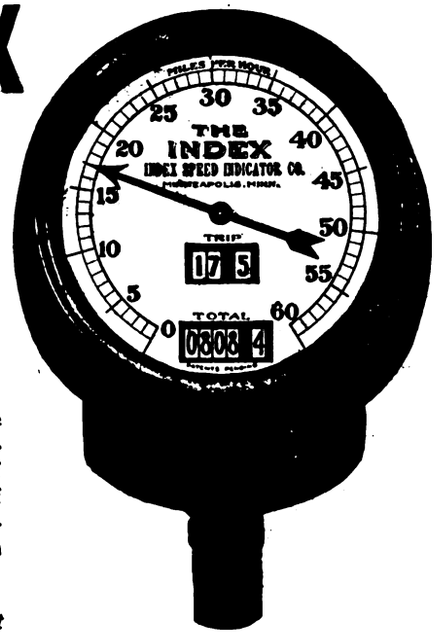
$800 **$800**

THE LAMBERT 18 FRICTION FLYER

"The Car Without A Gear Box"

SPECIFICATIONS.

CAPACITY—Three passengers. WHEEL BASE—95 inches. TREAD—56 inches. FRAME—Pressed steel. WHEELS—30-inch, wood artillery. TIRES—30x3 inch Michelin. MOTOR—2-cylinder opposed, 18 h. p. TRANSMISSION—Friction. SPEED—1 to 35 miles an hour. CARBURETOR—Float feed. IGNITION—Jump spark. RADIATOR—Honeycomb. DRIVE—Single chain to rear axle, encased. BRAKE—External on each rear hub. BEARINGS—Hyatt Roller and Standard Ball. CLEARANCE—12 inches. GASOLINE CAPACITY—12 gallons. LENGTH OF BODY, from inside of dash—76 inches. WIDTH OF BODY, to ouside mud guard—63 inches. WIDTH OF BODY—32 inches. WIDTH OF FRONT SEAT—36 inches inside of cushion. WIDTH OF REAR SEAT—18 inches inside of cushion. HEIGHT OF FLOOR FROM GROUND—29 inches PAINTING—French gray. UPHOLSTERING—Fine quality of leather; springs in cushions and backs of seats. WEIGHT—1,350 pounds. EQUIPMENT—Two oil lamps, horn and full tool equipment. PRICE—$800 complete, f. o. b. factory.



No car on the floor at the New York Show attracted so much attention as the Lambert 18. Sold at a price that absolutely precludes comparison. In value it has a field all to itself. Built to stand the hardest service, its solid, substantial appearance and correct lines of construction made it the "raciest" looking car of the lot. If you are looking for a runabout, see the Lambert 18—it will be a case of "love at first sight!"

THE BEST VALUE IN AMERICA AT THE PRICE.

Easily controlled. Is simplicity itself. Always ready to go and will keep on going until it gets there—and at any desired speed up to 35 miles an hour.

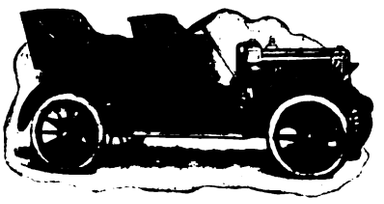
To the Man Who Is His Own Chauffeur

"Maxwell"



cars appeal most strongly.

The marvelous simplicity of mechanism eliminates the necessity of a technical course and enables the owner to know his car in an incalculably short time.

Did you read that story in the Outlook of October 5th about the man with the "Get-there" car? He went from St. Louis, Missouri, to Maine—and back, bumped all kinds of weather and road conditions, but he came through—and we couldn't see how that "Get-there" car could be anything but a "MAXWELL," so we asked him. And—well you can't mistake the performance of a "MAXWELL," even under a nom-de-plume—we guessed right.

There are 8,000 other "MAXWELL" owners who are just as proud of their cars as the man with the "Get-there."

If you don't know the "MAXWELL" line—if you have never ridden in one of these cars, write to me personally, Dept. 2, and I will see that you get a "MAXWELL" demonstration.

The new four-cylinder 26 H. P. Model D "MAXWELL" is already breaking records in sales—and why shouldn't it at $1,750?—when it offers all the efficiency of cars costing infinitely more. It is the triumph of J. D. Maxwell's career.

The 14 H. P. Tourabout at $825 and 20 H. P. double cylinder touring car at $1,450, were oversold last year and may be again this year, in spite of the fact that our new factory at New Castle, Indiana, has facilities for turning out 10,000 cars a year.

Get your "MAXWELL" demonstration without delay.

Benj. Briscoe President.

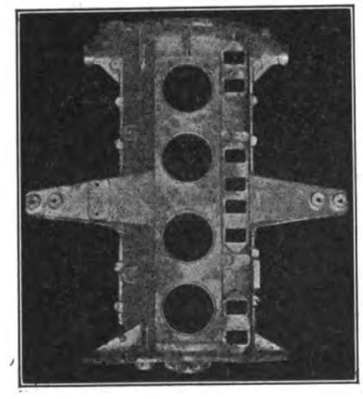
The Springfield Motometer

Presents New and Valuable Features

The Maximum Hand: Marks highest speed attained. Resets instantly. Can be disconnected in a moment.

New Easy Reading Dial—Big plain figures. Fired Enamel. Reads from the tonneau.



Spring Steel Reinforce on each end of the driving shaft. Compels easy curves and smooth running. Far better than gears.

Non-Clogging Pinion. Mud proof. Will not hold mud. A rainy weather necessity.

With these additional excellences, the Motometer is more than ever "The Speedometer for Service."

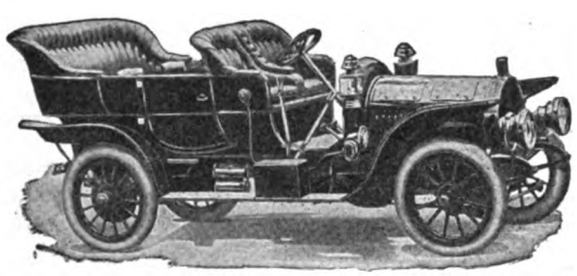
WARNING!



It has come to our attention that certain unscrupulous concerns are making imitation Splitdorf parts, especially the ratchet adjustment screw and the Bogert contact spring, which are ABSOLUTELY WORTHLESS so far as the operation of the coil is concerned, and the use of them will only break down the coil in a very short time.

All Splitdorf parts are covered by Letters Patent. We are bringing suit for infringement against these parties, and wish to call especial attention to the fact that any person buying, selling or offering for sale any of these parts becomes liable for infringement.

All Splitdorf parts now bear our registered trade-mark.

Remy Magnetos

which have become so well known to the automobile world and which have gained such great favor among their many users, are now being manufactured in the best equipped plant in the world devoted to the exclusive manufacture of Magnetos. This new factory, a model from the standpoint of efficient arrangement and high class equipment, together with perfected designs which are the results of years of experience in this line of manufacture, makes possible the turning out of the very highest grade ignition apparatus on the market.

For 1908 our line includes a new high tension Magneto without coil, which we build in large quantities and are selling at a medium price. It is simple, small and well made. It can be installed with minimum expense and is a high grade equipment in every respect. We also build Magnetos with coils for double ignition, and alternating and direct current Magnetos for all ignition purposes. It will pay you to investigate our Magnetos before deciding upon your ignition equipment for your 1908 cars.

We will exhibit at both New York Shows and the Chicago Show.

"WHITNEY" CHAINS

January 1, 1907 to November, 1, 1907, conditions as follows:

On January 1, 1907, we were renting about 38,000 square feet of floor space in a building not adapted for our growing business. At the same time we were giving much attention to our new buildings which were under construction, and not completed until July, 1907. During this period we moved our entire equipment to our new factory and for a number of weeks were obliged to operate machinery in both plants. We also carried on important experiments and constructed much special apparatus for our new factory. While thus handicapped we could not fully meet the increasing demand for "Whitney" Chains.. Nevertheless, we succeeded in shipping a greater number than ever before for an equal period of time.

Patented

"WHITNEY" CHAINS

November 1, 1907, to December 31, 1908, conditions as follows:

New fire-proof factory, one of the best, strongest and safest in the country. Floor space over 70,000 square feet. Best of light and excellent conditions for employes. Location one of the best in Hartford. Private side-track connecting with main line between New York and Boston. Land area over ten acres. Large increase in new machinery and tools. Improved methods. Inspection system more rigid than ever. Greater accuracy. Increased strength by the use of new materials and improved treatment. Greater durability. Better finish.

WINTON

The Best of Fours

will rank with other superseded models when you catch the spirit of **the six-cylinder year.**

One ride will make you an enthusiast. Try the Winton Six-Teen-Six on hill or parkway, at a crawl or a dashing spin—observe that speed changes are made on throttle without shift of gears—note how this car starts (on compressed air) without cranking—how it throttles down without jerk or jar—how handily it picks up and gets away—how it goes the route **like coasting down hill.**

Observe these things and you'll agree that the Six-Teen-Six is precisely the car for the man who wants the best there is.

"To own such a car is to own a kingdom; the driver's seat is a throne, the steering wheel a sceptre, miles are your minions and distance your slave."*

THOMAS

THE E. R. THOMAS MOTOR CO. presents four styles of chassis and nineteen styles of bodies

Thomas 4-20 Town Car

Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, $3,000 to $3,250.

Thomas 4-40 Detroit

A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse at a much lower price, shaft driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, $2,750 to $3,750.

Thomas 4-60 Flyer

The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, landaulet and limousine bodies. Prices, $4,500 to $5,700.

Thomas 6-70 Special

This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, $6,000 to $6,900.

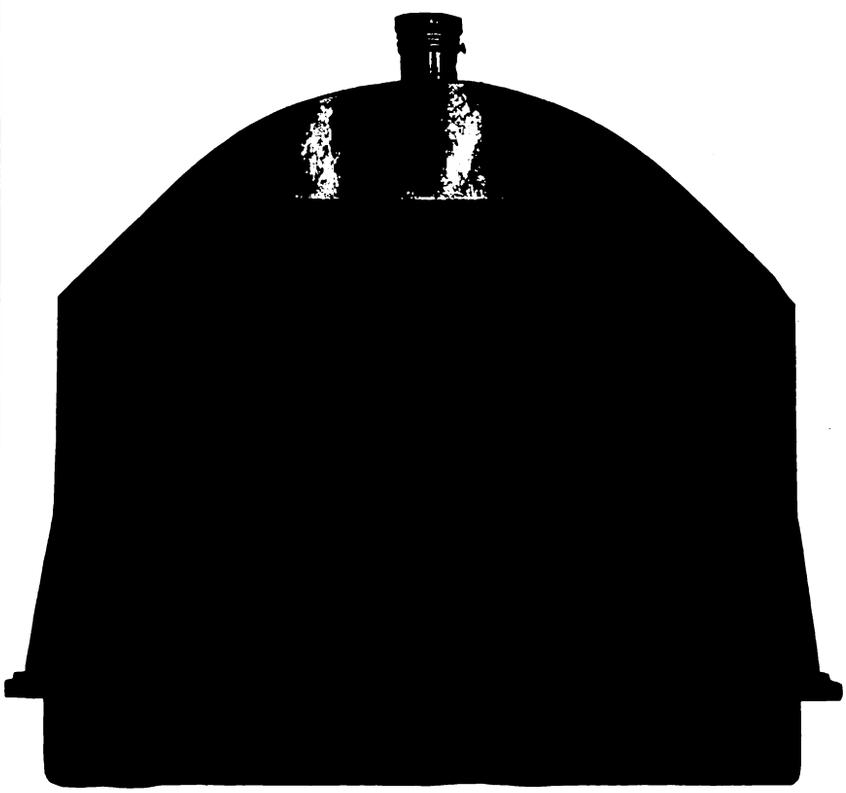
Matheson



THE MATHESON is standardized. The few changes for 1908 are unimportant refinements. As a matter of fact, most of these were incorporated in mid-season, in our '07 cars. This is the Matheson policy. We do not "save up" new features till the beginning of a new selling season. We neither expect nor desire Matheson owners to buy a new car every year, nor every other year. We are building today 1908 Mathesons, 1909, 1910, 1912 Mathesons, and he who invests will have, years hence, a car which will, after the hardest use, be running as strongly, as reliably, giving as efficient and as economical road service as any high class car then offered for sale. A 1906 Matheson stock touring car still holds the world's record for having carried seven passengers a mile in 50⅕ seconds. Most cars are bought:
Matheson cars are invested in.

Write for our new booklet, "I Drove My Matheson—" by Matheson owners, some of whom have made thousands of miles without even an adjustment, some of whom have gone through an entire season with a repair bill of nearly five cents. Better still, visit our exhibit, Space No. 25 in the gallery, at the Madison Square Garden Show. The Matheson sets a standard by which you may judge other high powered cars.

The $2000 Mitchell

The Standard of American Automobile Value

¶Perhaps you've noticed that most cars cost more than the Mitchell. ¶Did you ever notice that they were any better in finish or in material—or any better in performance on the road? ¶Ride in a $2000 Mitchell and see. ¶Have any Mitchell agent "show you" a Mitchell. ¶Look it over—go out into the country and test it on the toughest hill you know of—through some particularly bad stretch of sandy or muddy road. Notice your power—notice speed—notice the sweet running motor—the tranquil action of all moving parts—ease of control—notice general efficiency, Mr. Prospective owner. ¶Then if you can see how you'll get two or three thousand dollars more automobile value out of any other car—buy the other car we won't say a word. ¶But you won't find more value in any other car. ¶Present day automobile value is standardized in the Mitchell at $2000. ¶A demonstration will prove this to you. ¶You are under no obligation to buy when you ask for a demonstration. ¶If you are considering the purchase of a car we want you to know the Mitchell, we want "to show" you what you get in a Mitchell at $2000 and that you can't get any more in any other car regardless of the price. Call up the Mitchell agent.

Mr. Motorist:

You may think this egotism—but it's not.

Morgan & Wright Tires are making a big hit with the motorist because they continue to make good.

Here is what one motorist has to say about good tires.

POLAND SPRINGS, MAINE, Oct. 11/07

MORGAN & WRIGHT, DETROIT.

GENTLEMEN:—

Six weeks ago today we left Detroit with our 1908 Packard equipped with your tires; we have crossed the Green Mountains once and the White Mountains twice and have been thoroughly over Maine, New Hampshire and Vermont roads, we have had two punctures on the entire trip, we register today 3284 miles and our tires today look as good as the day we left home.

If your tires last like this what is to become of your repair department? And what's the use of carrying extra casings on our machine?

Very truly,
F. E. WADSWORTH.

Type G
Light Touring-Car
16 Horse-Power
$1850 Top Extra

4-cylinder, 16 h p, $1,850.

High power with light-weight makes an automobile "do things."

Of course—nobody doubts that. And yet automobile manufacturers keep on handicapping their machines with the weight and inefficiency of a water-cooled engine.

The Franklin cuts out all the weight of water-apparatus and the extra material necessary to carry that weight. By close study of design, materials, and construction, every part of the Franklin is made light-weight but strong.

The Franklin engine is smaller because it works at the temperature of the highest efficiency, 350° or more. A water-cooled motor can't keep up to this temperature, the water would boil away. This is why the Franklin went 95 miles on two gallons of gasoline in the great Efficiency Contest, while the nearest water-cooled machine stopped at 48 miles.

Type G, the light family touring-car, is a striking example of high power with light-weight and perfect strength. It does more and lasts longer than any machine at or near its price. It is the easiest on tires, fuel, and repairs, and gives the most service, dollar for dollar.

You'd better look into this matter of light-weight and the Franklin.

The 1908 Franklin catalogue goes very fully into the subject.

Rambler

Model 34
$2,250

In this car is embodied every modern feature that has withstood the severe test of practical service, and each has been refined and developed to the highest degree of mechanical perfection.

Through the offset crank shaft, straight line drive, direct from transmission gear to rear axle without an intervening joint, and ball or roller bearings at every point in the transmitting system, every ounce of cylinder pressure is delivered to the road wheels with the lowest possible loss in efficiency.

Equal improvements have been made in accessibility, comfort and outward appearance, and we offer this car as the equal, from every practical standpoint, of any car on the market, regardless of price.

We invite your most thorough examination, positive that it will convince you of the superiority of the Rambler.

Our advance catalog, describing in detail this car, both as touring car and roadster, and the new utility car, Model 31, is at your disposal. Write for it now.

RECEIVER APPOINTED FOR ROYAL

Solvent, but Financial Stringency Forces Friendly Action Against Big Company —President's Statement.

On Tuesday, 12th inst., the Superior Savings & Trust So. was appointed receiver for the Royal Motor Car Co., Cleveland, in United States Circuit Court. The proceedings were instituted by E. W. Cottrell, of Detroit, and Witt K. Cochrane, of Chicago, a stockholder and a creditor. The action, which is in the nature of a friendly suit, is brought to tide the company over embarrassment due to money stringency.

The company, it is stated, has plenty of orders ahead and under the protection furnished by the receivership expects to be able soon to continue business as before.

Immediately following the appointment of the receiver, E. D. Shurmer, president of the company, issued the following statement:

"The Royal Motor Car Co. is abundantly solvent. No one interested in its affairs need feel seriously concerned about the appointment of a receiver. A financial statement recently prepared by the Audit Co. of Cleveland shows that on September 1 the Royal Motor Co. possessed assets amounting to more than $650,000 in excess of all liabilities.

"The company is in fact suffering from nothing more serious than a rapidly growing and profitable business coupled with a stringent money market. The contracts on hand for cars to be delivered during the fall, winter and early spring has necessitated the employment of considerable borrowed money and present monetary conditions have made it impossible for the company to immediately meet its maturing obligations. There is no reason why the receivership should be other than temporary and in the meanwhile the business of the company will be carried on without interruption."

On Tuesday, F. A. Scott, secretary of the Superior Savings & Trust Co., said:

"The trust company was only notified this afternoon of its appointment by the court and has had no opportunity as yet to examine the Royal company's affairs. We are advised by those interested that the company's embarrassment was caused entirely by the rapid growth in its business and failure to obtain additional funds during the present financial stringency."

Minich to Direct Franklin Sales.

V. E. Minich, formerly general manager for the Haynes company, and more recently advertising manager for the National Cash Register Co., has been appointed director of the selling division of the H. H. Franklin Mfg. Co., Syracure. Minich will have charge of the Franklin branches and also general supervision of the sales department, the supplies and sundries business, and the advertising. F. R. Bump will continue as sales manager, and J. G. Barker will continue as head of the sundries department.

Charles M. Steele has been appointed advertising manager. Steele is a former Chicago newspaper man. Until recently has been head of the publicity department of the National Cash Register Co.

Morse Becomes a Thomas Manager.

The E. R. Thomas Motor Co. has created a new office, that of commercial manager, which has been filled by the appointment of E. C. Morse. He will be in full charge of all matters pertaining to the sale of the Thomas product and of the advertising. Mr. Morse was for eight years prominently identified with the sales department of the National Cash Register Co.

Sweet Adds Automobile Tires.

The Sweet Tire & Rubber Co., Batavia, N. Y., which hitherto has devoted itself to the production of solid tires, will enlarge its sphere by engaging in the manufacture of automobile and bicycle tires also. The necessary machinery for the purpose now is being installed.

MOON'S CHANGE AND THE CAUSE

Adopts New Name and Replaces a Foreign Car—New York House to Handle Eastern Territory.

As the result of negotiations that have been in progress ever since the Hol-Tan Co., of New York, relinquished the American agency for the Fiat car, a change has come over the Moon. Henceforth it will be known as the Hol-Tan and the Hol-Tan Co. will act as chief sales agents and will handle all territory east of Pittsburg and Buffalo, including those two cities.

The car will continue to be made by the Moon Motor Car Co., of St. Louis, who will appoint agents and generally care for the business in that part of the country not covered by the New York house.

Harry Fosdick, sales manager of the Hol-Tan Co., will direct the selling campaign. He is possessed of some original ideas in respect thereto which he promises will prove more than interesting to agents—and others. Until he "mixed" with the Italian car, Fosdick always had handled an American car and is "at home" again.

Kansas City Company in Trouble.

Involuntary bankruptcy proceedings were instituted on the 9th inst. against the Kansas City Motor Car Co., Kansas City, Mo., at the instance of F. E. Wear, president of the company, and other creditors. Mr. Wear, the principal creditor, said the company is solvent, but the temporary financial stringency had made it impossible to finance the current business of the company. Its plant is near Sheffield, Mo. Its officers state that the available assets amount to $400,000, while no statement of the liabilities is obtainable, although other sources place the liabilities at $300,000, and the assets at half that sum. Although the company started in a small way and cut no figure outside its immediate vicinity, it expanded greatly during the past year.

Digitized by Google

In the Retail World.

Greensburg, Ind., now has a fully equipped tire vulcanizing and repair plant. W. P. Skeen opened for business last week.

The Fort Wayne Motor Car Co., Ft. Wayne, Ind., has moved from West Berry street. The garage now is located on Columbia street.

Leakage of an oil stove caused a slight fire in the National Motor Car Co. garage at Oakland, Cal., November 3. The loss is estimated at about $1,000.

The American Auto Co., has absorbed the Henderson Auto Co., both of Cedar Rapids, Iowa. Cadillac, Franklin and Buick cars will be handled as formerly.

J. E. Odell, Ackley, Iowa, has sold his garage to F. M. Michaels. Following the sale he purchased the business of L. Rice at Cedar Falls, which he will continue.

Archer, Combs & Winters Co., Inc., is the style of a new jobbing house which has commenced business at 306 Oak street, Portland, Ore. Its capital stock is $20,000, fully paid in.

The Buck Automobile Co., has moved from Davenport to Des Moines, Iowa. It is located at 612-614 Mulberry street, where Royal Tourist, Oldsmobile and Peerless cars will be carried.

O. G. Roberts will build a cement block garage on Gay street, between Seventeenth street and Miami avenue, Columbus, Ohio. The dimensions of the building will be 75 x145 feet, and will cost $6,000.

A four story terra cotta brick garage will be erected on the east side of Michigan boulevard, north of Fourteenth street, Chicago, by Mrs. Julia F. Heyworth. The building will be leased to the Winton Automobile Co.

Plans have been made for Lechter's Garage to be erected at North First street and St. James place, San Jose, Cal. The specifications call for a two story building, with a front of half timbered English style. The structure will measure 69x132 feet.

No cause is assigned for the fire which partially destroyed ten cars and damaged twenty others in the garage of the Reo Motor Car Co., Cleveland, 3d inst. The building was not badly damaged but the injury to the cars will result in a loss of several thousand dollars.

Fire which started in the four-story "flat-iron" building in Portland, Me., Tuesday, 12th inst., spread to the adjoining establishment of the James Bailey Co., dealers in automobile supplies. The losses are not itemized, but the total damage is estimated at $100,000.

The Clifton Livery & Garage Co., Cincinnati, last week elected officers as follows: President and general manager, M. E. Braum; vice-president, William Windisch; secretary-treasurer, George Behlan; directors, Dr. L. S. Colter, Dr. J. A. Haerr, F. H. Kirchner, M. F. Galvin and F. S. Krug.

Contracts have been let for the erection of a large garage on Eighth street, for the Solliday Motor Car Co. It will be two stories high, 75x125 feet, providing 20,000 square feet of floor space.

Business Difficulties.

Howard E. Whitney, a dealer in Cambridge, Mass., this week filed a petition in bankruptcy. His liabilities are $11,563, and assets $7,926.

F. F. Dudley, a Winthrop (Mass.) dealer, has filed an involuntary petition in bankruptcy. His liabilities are $6,487, of which $4,658 is secured, while his assets amount to but $402.

Louis C. Howard, who dealt in automobiles at 216 West Fiftieth street, New York, has been petitioned into bankruptcy by three creditors, whose claims aggregate $649. Several judgments which previously had been issued against him, had been returned unsatisfied.

On petition of the R. C. McClure Co., R. B. Sweet and Jesse C. Low, James C. Setrigut has been appointed temporary receiver for the Elbridge Motor & Tool Co., of Elbridge, N. Y. The liabilities are estimated at $5,000. The company has a plant at Elbridge where it has made motors for automobiles and motor boats. Moving the plant to Syracuse after reorganization, is being talked of.

A petition in bankruptcy has been filed against the Da-An-Nite Auto Supply Co. of 1912 Broadway, New York, by three tire companies, whose claims aggregate nearly $8,000. It is alleged that the company on Nov. 4 admitted in writing that it is insolvent and willing to be adjudicated bankrupt. The company was incorporated Dec. 3, 1906, with a capital stock of $20,000, with Francis J. Wallace president.

The Kalb & Berger Mfg. Co., manufacturer of automobile bodies, at 532 East Seventy-second street, New York, has been attached on a claim for $2,000 in favor of Mary Ritter on a note. The company was incorporated in January, 1907, under the laws of the District of Columbia, with a capital stock of $250,000. The sheriff levied on the machinery and tools in the factory, and also upon an automobile. Mrs. Ritter loaned the $2,000 to the company, she said, on August 3, on representations that it was doing a large and profitable business; she now alleges that the business is not much more than a repair shop. She is a widow, and drew the money out of a savings bank to make the loan.

Carrie to Assist Manager Jewell.

Frank G. Carrie has been appointed assistant manager of the recently created Franklin branch in New York City. Carrie was formerly New York branch manager for the Haynes company. With the Franklin people he will be associated with W. S. Jewell, who recently took charge of the New York depot.

The Week's Incorporations.

Brooklyn, N. Y.—Allen-Swan Co., The, under New York laws, with $27,000 capital; to deal in automobiles, etc. Corporators—K. Swan, H. Swan and L. H. Allen, Brooklyn.

Memphis, Tenn.—Cullen-Butler Auto Co., under Tennessee laws, with $5,000 capital; to deal in automobiles. Corporators—E. H. Ward, H. A. Simms, E. R. Odle, F. L. Butler and H. H. Cullen.

Oakland, Cal.—Roslyn Motor Car Co., under California laws, with $50,000 capital. Corporators—Charles R. Ellenwood, Theodore Olmstead, J. M. Limbaugh, Ira H. Keene and F. B. Ellenwood.

New York City, N. Y.—C. G. V. Import Co., under New York laws, with $120,000 capital; to manufacture and sell automobiles. Corporators—Emil Voight, J. P. Murray and C. A. Conlon, New York City.

Newark, N. J.—Howe Motor Car Co., under New Jersey laws, with $125,000 capital; to deal in automobiles. Corporators—Albert E. Howe, Michael F. O'Neil, John Howe and Thomas J. O'Neil, Newark.

Reading, Pa.—A. H. Yocom Co., under Pennsylvania laws, with $50,000 capital; to manufacture motors for automobiles. Corporators—Arthur H. Yocum, George Y. Yocom, and Isaac Hollenbach, Reading.

New York City, N. Y.—Eastern Auto Service Co., under New York laws, with $100,000 capital; to manufacture automobiles, etc. Corporators—F. D. Hollister, J. Seitz, Brooklyn; M. Kram, New York City.

New York City, N. Y.—D. P. Harris Hardware Co., under New York laws, with $200,000 capital; to manufacture and deal in motors, engines, hardware, etc. Corporators—D. P. Harris, S. Maskowitz and H. Goldman, New York City.

Brooklyn, N. Y.—Carlson Motor & Truck Co., under New York laws, with $75,000 capital; to manufacture automobiles, motors, trucks, etc. Corporators—C. A. Carlson, Brooklyn; C. S. Calvert, Newark, N. J.; E. H. Slickels, Edgewater, N. J.

Flint, Mich.—Michigan Motor Castings Co., The, under Michigan laws, with $50,000 capital; to moke motor castings. Corporators—J. W. Thompson, Detroit, president; Frank Bromley, Detroit, vice-president and treasurer; A. H. Goss, Flint, secretary.

New York City, N. Y.—International Automobile School and Engineering Co., under New York laws, with $50,000 capital. Corporators—John T. Baldwin and May Baldwin, 239 East Fifty-third street; Lawrence Gregory, 629 West 135th street, New York City, directors.

Smith Woodworking Plant Enlarging.

The Smith Automobile Co., Topeka, Kan., is making another addition to its plant in which all the wood working will be done. The company already has the distinction of producing everything that enters into the make-up of its cars, save the tires.

HAVE HAD ENOUGH OF EARLY SHOWS

Well Defined Opinion Growing Out of the New York Exhibitions — How They "Panned Out."

It is fairly safe to say that the trade has had more than enough of so-called "early shows."

If, when the show in Madison Square Garden, New York, closed on Saturday night last there was any one who was anxious to again assist in "forcing the season," by holding an exhibition in October or November, his voice was not very strong or very numerous.

It was not that the show was not a successful one. The attendance was gratifyingly large. There was a full house each evening and on the two "dollar days" and the closing night the crowd was not much reduced. It is understood that the total gate receipts for the week were not fifteen per cent. less than the record of the show in the Garden in January last. But while there may be a few exceptions to the rule, the sales did not hold true in the same ratio. Business was done and, in some cases, good business, but generally speaking, any caution in placing orders not born of the disturbed financial situation was due to a not unnatural disinclination to make purchases so far ahead of the season of actual service.

As the Motor World of last week stated, however, the Garden show served a useful and stimulating purpose in restoring the spirits which had drooped as a result of the disappointing harvest of the show in Grand Central Palace the previous week. But for all of that, there is small doubt that unless a sweeping reversal of views and opinions occur, the last has been seen of automobile shows in either October or November. While the executive committee of the Association of Licensed Automobile Manufacturers has not met since the exhibition closed, a sufficient number of influential members of the organization have made known their views and they seem to point unerringly to a return to January dates.

It also is probable that whenever the next show may occur, some safeguard will be thrown around the sale of the so-called "trade tickets." These are sold in lots to exhibitors at 50 cents each, and it appears that there were those who were not above turning a few dollars into their pockets by disposing of them to speculators. As on two nights of the week, the admission fee was raised to $1, it left the speculators room to cut prices and yet earn a profit. It is understood that detectives who were engaged to ferret out the guilty exhibitors succeeded in doing so in at least two instances.

Of the future of the Grand Central Palace show nothing is yet known. Coming at the very crisis of the financial upheaval when people were more concerned about the safety of their bank accounts than about automobiles, it felt the effects in undue measure and few exhibitors had cause for congratulation. The accessory exhibitors especially were disgruntled, but Time is a wonderful healer and a twelve-month may alter their feelings and opinions.

It is freely stated that the Automobile Club of America, which conducted the Palace show, has had enough and will bow itself out. But when pressed for a specific statement, A. C. A. officials are inclined to be evasive and to take refuge in the fact that the directors have not held a meeting since the show closed.

"We may or we may not have to do with another show," is the nearest to an expression of opinion that can be drawn from Secretary Butler. He did say, however, that the Palace exhibition had earned a profit and that a rebate would be paid the space holders.

Merger Off; Dividends Restored.

The news that a dividend of 1 per cent was paid on October 31 on the common stock of the Rubber Goods Manufacturing Co., which includes the Hartford Rubber Works, G & J Tire Co., and Morgan & Wright, and that this disbursement would probably be made quarterly hereafter, came as a complete surprise to financial circles this week. Last summer the United States Rubber Co., which owns all but $200,000 of the Rubber Goods $16,941,700 common stock and all but $3,000,000 of its $10,351,400 preferred stock, announced that the two companies would be merged for economy of management as soon as possible, probably by an actual liquidation of the Rubber Goods Company. At the same time it was announced that the dividends on the Rubber Goods common stock would be discontinued.

An official of the United States Rubber Co. admitted that the putting of the Rubber Goods company on a regular 4 per cent. basis signified that the consolidation of the two had been given up, for the present at least. The reason for it was not stated. From July, 1901, to October, 1906, when 1 per cent. was declared, there was no disbursement on the common stock.

Deere-Clarke Property is Sold.

Interests represented by C. H. Pope have purchased the property of the Deere-Clark Motor Car Co., Moline, Ill., for $37,500, or 40 per cent. of the aggregate of claims held against it. The purchasers represented all but about $10,000 of the total of $93,000 of claims. They secured this $83,000 of claims by purchase on the basis of 40 cents on the dollar. The factory was purchased on the same basis, with the result that creditors whether previously selling to Mr. Pope or taking the dividend to be declared from the sale of the property will realize approximately the same percentage on their claims.

SMALL CARS FEATURED AT PARIS

Vehicles of Moderate Power Conspicuous at French Show—Decorations Elaborate; Prices Reduced.

In two ways the tenth Paris Salon, which opened Tuesday, 12th inst., nearly a month earlier than usual, is said to eclipse all former exhibitions of its class. According to cabled reports the gorgeousness and elaboration of its decorations have never before beein in any way equalled, and the tendency toward the production of cars of medium and low power, as well as a marked reduction in the cost of some of the better known and more powerful high priced machines, also is unprecedented in the history of French shows.

As was the case a year ago, the space available in the Grand Palais and vicinity proved inadequate, and a temporary structure has been built in the Esplanade des Invalides, across the Seine. As also was the case last year, this section of the exhibition is devoted to commercial applications of the motor vehicle, motors, machinery of construction, and parts, while the main portion of the show is occupied by the numerous exhibitors of pleasure vehicles, the accessory people being relegated to the cramped quarters of the galleries and adjacent halls.

The decorations involve a lavish use of electric lamps for the ceiling and walls, while the individual exhibitions have been permitted to follow their own inclinations in staging their displays. The usual result has followed, many garish and wonderful as well as beautiful effects being secured. The most prominent display in this respect is that of the De Dion company, which takes the form of a Chinese Pagoda, commemorative of the Pekin-Paris race of last summer. In the same connection, the grouping together on one stand of all the cars which have won notable contests during the year, also attracts considerable attention.

Nearly all the French makers are now going in for light models of 16-20 horsepower, and costing from $1,000 to $2,000. Many of these cars are now shown for the first time. Several of the European makers outside of France also are showing similar constructions, notably those of Italy. This, coupled with the lowering in price of the higher powered cars, already mentioned, the cut being variously stated as averaging from 15 to 40 per cent., reveals a tendency on the part of the Continental branch of the industry which is considered as being very significant. Structurally, little novelty is to be found. There are few freak designs on view, and everything points to an increased trend toward absolute standardization of design, regardless of type or horseporew.

Trade Papers.

"We take this occasion of renewing our sense of obligation to the different trade papers that appeal to the carriage builders for their constituency. We are probably so used to this item of necessity in our business as to take its existence as a matter of course. If we were deprived of them for any period, however small, we probably would be brought to a realizing sense of their value and how much we depend upon them."—From the committee report rendered at the Carriage Builders' National Association's annual convention.

Brakes and Braking Mechanism.

Brakes and braking mechanism have received an unwonted, though justly deserved amount of discussion during the last few months, and the reward of past experience, coupled with this agitation, is seen at once in the improved devices applied to a majority of the new cars. But however near to the ideal the braking arrangements of a car may be, they are liable to failure, or to inefficient response unless the driver learns when and how to use them, and wherein their limitations lie. It is possible to stop the average car in an almost incredibly short distance, even when running at a high rate of speed. Knowing this, the average driver pays little or no attention to the effect of such a stop upon the machine, unless the effect on the tires, which is plainly evident, be excepted. Yet the intelligent and consistent use of the brakes is as much and perhaps more, an art, than the intelligent and consistant use of the clutch and gears, and braking should be given full as much attention by the learner as any other of the several divisions into which it is possible to segregate the art of car manipulation.

Few drivers would think of jumping a car into high gear and getting the engine up to its normal rate of speed inside of a distance equivalent to a couple of city blocks, under ordinary circumstances. Yet in case of emergency, the brakes are called upon to bring the machine to a full stop in a distance equivalent to perhaps less than half the length of a single block. The amount of work involved in accelerating a car to any given speed, may be considered as roughly equivalent to the amount of work involved in bringing it to rest in the same distance from that speed. Hence stopping a car in a shorter distance than is commonly required for getting up speed, must inevitably throw upon it strains which are largely abnormal.

A foreign scientist recently has been examining into the theoretical relation between the stresses due to positive and negative acceleration, and announces that for a 3,000 pound car, running at 30 miles an hour, and stopped in 20 yards, a braking effort equivalent to 67.3 horsepower is required. At 40 miles an hour, 63.6 horsepower would be required to stop the same car in 50 yards, while a 3,500 pound car, running at 60 miles an hour would demand the expenditure of 126 horsepower if it were to be stopped in 100 yards. One hundred and seventy-two horsepower would stop the second car in 5 seconds, and 252 horsepower in 50 yards, or 630 horsepower, if the full stop were to be attained in 20 yards. These figures represent the amount of work required to overcome the kinetic energy of cars of these weights, moving at the speeds stated. No matter how the brakes are applied, the equivalents of these amounts of work must be expended somewhere about the machine in order to check its motion.

Comparison in this way of car weights and "braking horsepower," if the term may be employed, shows at once the necessity for an excess of retarding over accelerating power, and also implies that where that excess is lacking, sudden stoppages must throw enormous and disastrous strains on the car. To avoid these strains, the brakes should be applied gently and only in such an amount as conditions may require. The best drivers are those who have recourse to the brakes only in case of emergency. The less the brakes are used, the less the mechanism of the car is strained, and though this fact is commonly conceded, absolute realization of its importance comes only by comparison of the respective power costs of starting and stopping.

Why the Double Rumble?

It may be possible that the big runabout with the rumble seat may survive the test of time, but it is difficult to discover what particular niche is filled or is to be filled by the runabout with the "double rumble."

Unless it appeals to harum-scarum youths in or out of college, who are possessed of more money than brains and more of affected "sportiness" than either of the other things, where the market lies for such vehicles will be one of the matters of at least passing interest that the future will decide.

There is some shadow of excuse for the single rumble. It may appeal to the ultra-fashionable who would have their chauffeurs possessed of the appearance, if not the virtues of a liveried footman, or on occasion it may prove of real use, as, for instance, when an owner may wish to drive a guest to a given point and in turn may desire to have his chauffeur do the driving on the return journey, or, if he is possessed of a negro driver, the rumble seat affords a means of preventing such misunderstanding on the part of the rabble as was once disclosed by that famous remark attributed to one of the latter. "Say, look at the nigger with a white driver." Certainly the "double rumble" was never designed for woman's occupancy and with big, comfortable tonneaux available, is not easy to comprehend why any man should desire that any of his male friends or any two male members of his family should after performing mutual contortions from opposite sides of the car, stow themselves each in a squat seat below the level of the heads of the men in

Digitized by Google

front, and in position to receive the full benefit of every jolt, and which withal is not too safe. It may be that a few "young bloods" anxious to "cut a dash" may revel in that sort of thing, but if so it hardly seems probable that they exist in profitable numbers.

Viewed from whatever standpoint, it is difficult to see in the "double rumble" any of the elements of permanency. At the same time, it is possible to see how some unthinking persons purchase such bodies as an improvement on the touring car and thus meet with disappointment. In other words, the tonneau so much more comfortably and acceptably fills the same bill that the question cannot but arise, as, indeed, it several times has arisen, Why the double rumble?

The Use of One Chassis.

A most important phase of the development of motor car design at the present time, is revealed to a great extent by the prevalence of the high-powered runabout. Generally speaking, whether known as runabout, tourabout, "sportabout," roadster, or gadfly, this class of vehicle is mounted on a chassis practically identical with that of the touring car produced by the same maker. In certain instances the position of the radiator is altered, the wheel base shortened, and the angle of the steering column changed to suit the altered conditions of load and seating position. In others practically no change is made. Invariably, the same parts, with few exceptions enter into both chassis. The same relation, with about the same number of possible exceptions as to detail, apply to the limousine or closed body and the chassis upon which it stands.

For a long time makers strove to make the body as nearly as possible independent of the chassis, to make the power plant and running gear an independent automobile unit in other words. This having been accomplished to an almost inclusive degree, the advantages of reducing the number of chassis produced to one or two, is appealing strongly to all the makers. In many instances the fact that the chassis employed in several models are practically the same, is to be learned only upon close questioning. In others, no secret is made of the fact, while in at least one instance a maker takes pains to advertise his use of but a single understanding for all three of the car types he produces.

This is broad and valuable economy as a practice, both in the simplification of shop methods, reduction in the number of parts to be produced, and consequent limitation of production expenses, and also in that it tends to segregate chassis and body building into two independent branches. This latter trend, of course, encourages the entrance of the old-line carriage makers into a most important contributory line of the industry and gives them a footing which otherwise they might be long in gaining. Its ultimate effect on the purely commercial side of automobile building is entirely a matter of conjecture at the present time. But apart from that side of the question which relates to the important and rather ticklish matter of specialization in its tendency to subdivide of the work of production, there can be no doubt of the general benefit to be derived from the concentration of manufacturing effort upon one, or at the most, two basic types of mechanism, adapted to as many changes of aspect as may be expedient.

One advantage of the show season, which, though utilized very largely, seldom appears to excite any comment, is the opportunity it presents for the makers of attachments of various sorts to get into touch with the constructions displayed, both for studying their nature, and for gathering data to be used in preparing both special equipments and universal fittings. Thus from opening day to closing night, a crew of draughtsmen and engineers may invariably be seen going from car to car, measuring and recording the dimensions which most vitally concern them, or questioning the designers. It is only by such close and accurate means that the accessory makers are enabled to ship their instruments with any degree of certainty that they will go into place as required. What it saves them in time and labor, to have all, or nearly all the cars gathered under a single roof for a few days, would be impossible to compute. Much that they learn, in fact, could be obtained in no other way except in the course of years of study.

There is no longer any doubt of the advantage of using a direct drive on the gear ratio which is most used in ordinary driving. Cars having speed changing devices in which three options are given on the forward relation are almost universally supplied with such an arrangement, while the practice also is common on four speed gears. It has required several years, however, to convince designers of four-speed gears that it is good economy to place the direct drive, that is to say, the connection on which the lay shaft is idle, if not stationary, on the speed normally used, regardless of whether it happens to be the thord or fourth. In most instances it is the third speed, and accordingly third speed direct drives are the most advantageous, since they permit the most economical transmission of power the greater part of the time. The "double direct" on third and fourth speeds, while desirable, if of questionable advantage when obtained at the expense of a twin bevel drive.

COMING EVENTS

November 9-16, Philadelphia, Pa.—Philadelphia Automobile Trade Association's annual show at First Regiment Armory.

November 15-16, Newark, N. J.—New Jersey Automobile and Motor Club's 24-hour endurance contest.

November 16, Providence, R. I.—Rhode Island Automobile Club's annual hill climbing contest on Riverpoint hill.

November 26, 27, 28, Chicago, Ill.—Chicago Motor Club's three days' 600-mile reliability run.

November 28, Wilmington, N. C.—Automobile races on Wrightsville beach.

November 28, Riverside, Cal.—Annual hill climbing contest on Box Springs hill.

November 30-December 7, Chicago—National Association Automobile Manufacturers' first annual exhibition of commercial motor vehicles in 7th Regiment Armory.

November 30-December 7, Chicago—National Association Automobile Manufacturers' Annual show in Coliseum and First Regiment Armory.

December 7-14, San Francisco, Cal.—Automobile Dealers' Association of California's second annual show in the Coliseum.

December 9-14, Detroit, Mich.—Detroit Automobile Dealers' Association's show at Wolff's pavilion.

December 14-21, St. Louis, Mo.—St. Louis Manufacturers' and Dealers' second annual show in Jai Alai building.

January 14-18, Hartford, Conn.—Hartford Automobile Dealer's Association's annual show in Foot Guard Hall.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sportsmen's Association's show in Light Guard Armory.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's show.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association show in Duquesne Garden.

A. A. A. RE-ELECTS OLD OFFICERS

Annual Meeting of Directors—Financial and Other Reports Presented—"Banqueting Tour" One of the Suggestions.

William H. Hotchkiss, of Buffalo, succeeded himself as president of the American Automobile Association at the annual meeting of the Board of Directors, which took place in New York City, Friday last, 8th inst. All the other incumbent officers also were unanimously re-elected, as follows: First vice-president, Lewis R. Speare, Boston; second vice-president, Asa Paine, Minneapolis; third vice-president, Ira J. Cobe, Chicago; treasurer, George E. Farrington, New York City; secretary, F. H. Elliott, New York City.

Because of the presence of so many out of town directors in New York on account of the shows, the annual meeting of the board was the largest ever held, representatives from Leominster, Springfield and Worcester, Mass.; Providence, R. I.; Hartford, Conn.; Buffalo, Syracuse, New York City, Binghampton, Schenectady and Rochester, N. Y.; Newark, Paterson and Jersey City, N. J.; Philadelphia and Pittsburg, Pa.; Cleveland, O.; Chicago and Washington, being in attendance.

Besides the election of officers and a vote to increase the board from 11 to 17 members, the meeting was taken up by reading the annual reports of the officers, the treasurer's report naturally being the most interesting, as this was the first time that a detailed account of the association's financial affairs has been made public.

On November 1st, when the report was made, there remained a balance in the treasury of $4,851.03. The fiscal year began on February 1st and the balance on hand at that time was $8,487.84. The total receipts from February 1st to November 1st have been, including the balance carried over, $20,862.85, divided as follows: 64 sanctions, $2,045; blue books, $925.05; maps, $200; buttons, $105.25; pins, $97.75; individual memberships, $532.75; associated clubs, $3,426.50; unaffiliated clubs, $562; Vanderbilt race, 1906, $3,587.06; protests, $70; donation account of rent, $425, and several minor items. There is also coming from the touring board the sum of $2,020.19.

The largest item of expenditure is the account of the secretary's office, where $4,973.05 was paid to the secretary and his assistants in salaries; $1,177.32 for stationary and postage, and $2,120.94 for traveling and sundry expenses, making a total of $8,271.31. The expenses of the other offices naturally are small in comparison $297.50 being the total expense of the treasurer's office, the items being a bookkeeper's salary and sundry expenses; $625.98 for the president's office, where the items were $280 for a stenographer and $345.98 for traveling and sundry expenses, and $523.25 for the touring board, the largest item there being for clerical assistance. The next largest item was the money returned to State associations, pro rata of dues, the amount being $2,533.76, which left a balance from that source of only $892.74. A number of sanction fees also were returned for various reasons, and the rent for the association's offices was $1,256.24; the other items are of minor importance.

President Hotchkiss rendered a long report, in which he announced that the permanent edition of the association's year book, to number 20,000 copies, will be mailed to the various club secretaries to be distributed to the individual members free of charge, about the 15th of this month. The present year book is small and much space is devoted to symposiums of the officers, and President Hotchkiss advocates that in future it should be much enlarged and perform the function of the hand-book published yearly by the Royal Automobile Club of England. The growth of the national body makes necessary an enlargement of the executive committee, which now numbers seven, said Mr. Hotchkiss. The present committee numbers seven, and with it have met the chairman of the boards, who have not heretofore been members thereof, making a governing body of ten in all. In the coming year there will be six boards instead of four. Each chairman should, in President Hotchkiss's judgment, be ex-officio a member of the executive committee instead of only the president, first vice-president and treasurer, as is now the case. Under the present by-laws four members at large, not officers, are appointed to such committees, which number he thought should be increased to seven. The change was adopted so that the executive committee will hereafter in effect be one of seventeen members instead of ten as at present.

President Hotchkiss also recommended an active campaign for individual members. The president thinks, however, that there should be a more equitable division of the fees paid in by individual members, for as present conducted, seven-eighths of the revenue inures to the benefit of the clubs and associations, while the national body, which bears the expense of recruiting them receives only one-eighth of the revenue. The report mentioned the fact that a special committee of sanctions had been appointed to make suggestions governing track racing, and that there should be a Vanderbilt cup race next year and also a contest for stock touring cars, the suggestion being advanced that the racing board have an additional officer, to be known as a vice-chairman—preferably an engineer—to whom many of the matters on which the racing board will have to pass, may be referred, and from whom expert advice and services could be secured, the additional expense to be met by an increase in sanction fees.

Secretary F. B. Hower, of the touring board, reported that the receipts from the Glidden tour and the tour for the Hower trophy were $7,401.24, and the expenses $5,381.06, leaving a balance of $2,020.19, which will be reduced to $1,463.85, if the general expenses of the board, amounting to about $566.34, are deducted.

According to Secretary F. H. Elliott, the association now has an aggregate membership of 19,209, consisting of 16 affiliated State associations, comprising 120 clubs with a membership of 17,550; 15 unfederated clubs with a membership of 1,035; 621 individual members and three life members. According to the records of October 1, 1906, there were 5 State associations, comprising 70 clubs, with an approximate membership of 8,857, showing a healthy increase of 10,352 members during the past nine months. The racing board has granted 64 sanctions, for which about $2,000 has been received. The secretary also advocated a campaign for individual members, suggesting that each State association take up the question, and also that a uniform yearly rate of $2.00 be charged, to be divided equally between the State associations and the national body.

A somewhat amusing part of Mr. Elliott's report is a suggestion "that a banqueting tour be arranged so that representatives of the association may be present at the social functions which are held during the winter months by the affiliated clubs."

Berkshire Roads to be Posted.

As the Berkshires afford a popular touring ground for automobilists, it will no doubt be welcome news to learn that the Berkshire Automobile Association, recently formed at Pittsfield, Mass., will make its first work that of posting the highways with guide posts, warning signs and other information. The association elected officers as follows: President, Daniel England; first vice-president, Franklin Weston; second vice-president, Samuel G. Colt; treasurer, R. P. Parker; secretary, S. H. Clapp.

Scranton Forms an Association.

With forty-three charter members the automobilists of Scranton, Pa., have organized the Automobile Association of Scranton, electing the officers as follows: President, Dr. H. B. Ware; vice-president, Geo. Jermyn; secretary and treasurer, Hugh R. Andrews. Nine physicians are included in the present membership. Scranton has about 200 automobilists.

Sacramento Club Elects Officers.

Recently formed, the Sacramento County Automobile Club, of California, has completed organization by the election of the following officers: President, Dr. J. A. McKee; vice-president, R. A. Wood; secretary, Gilbert P. Beere; treasurer, J. G. Patterson; directors, Dr. H. C. Bulson, L. J. Shepard, Dr. C. L. Megowan, E. S. Brown and R. H. Weil.

SHOW WEEK IN PHILADELPHIA

Seventh Annual Exhibition Opened with Big Attendance—Practically All Leading Makes of Cars are Staged.

Without formality other than the fanfare of many horns and other noise makers, the seventh annual automobile show promoted by the Philadelphia Automobile Association opened auspiciously in the First Regiment Armory, that city, Saturday night last, 9th inst.

Because of the proximity of the Madison Square Garden show, which closed the night the Quaker City exhibit opened, naturally all the exhibits were not in place when the doors were swung open at 8 o'clock, and it was thought this fact would cause the attendance to be smaller than on previous opening nights, but just the opposite developed. The crowd was so great that inspection of the exhibits was out of the question, and this fact made the dealers feel confident of a corresponding increase throughout the week. It was not until Monday that the several vacant spaces were filled by the arrival of exhibits from New York.

The evening attendance since the opening has averaged fair, but of the crowds that have not come during the daylight hours, the less said the better.

Philadelphia's show of course is a local affair, and is the first of the community exhibitions to take place this show season. It is the seventh annual display, and is a record-breaker in every respect for Philadelphia, being greater in scope and number of exhibits, than any previous affair. How the effort to "force the season" by such early dates will "pan out" is another question. Thirty-two automobile exhibitors are in evidence, representing forty-two cars, while the number of accessories exhibitors foots up to twenty-four.

"Autumn" is the theme predominant in the decorations. White and yellow are the prevailing colors hung from the ceiling of the armory. The aisles, covered with brown burlap, are suggestive of just ordinary roads, which will resolve into an intimation of oiled highways when the country visitors shuffle some of the rural mud off their boots. The idea of turf is expressed in the flooring of the exhibit spaces, which are in green. Trees and autumn leaves heighten the illusion. Instead of a motley assortment of signs that has marred some previous shows, but one neat sign giving the name of the car or article manufactured is permitted in each booth, which gives a pretty ensemble, one that will not cause visitors to weary of their surroundings.

Practically all the leading makes of cars are represented, including the Peerless, Franklin, Ford, Rambler, Matheson, Pope-Hartford, Pierce-Arrow, Cadillac, Baker, Stoddard-Dayton, Packard, Maxwell, Locomobile, Stearns, Crawford, Elmore, Royal Tourist, Winton, Marmon, Acme, Mitchell, Apperson, Autocar, Lozier, Reo, Premier, Columbia, American Mors, Cleveland, Walter, American, Overland, Marion, National, Pullman, Jackson, Mercedes, Pope-Waverly, Pennsylvania and Wayne. With few exceptions they are shown by the Philadelphia agents. In accessories, the majority of staple articles are displayed by local sundries dealers. The list of exhibitors follows:

Quaker City Automobile Co.—Peerless and Franklin.
Ford Motor Car Co.—Ford.
The White Company—White.
Thomas B. Jeffery & Co.—Rambler.
Titman, Leeds & Co.—Matheson.
Foss-Hughes Motor Car Co.—Pierce Arrow, Cadillac and Baker electric.
Hamilton Auto Co.—Stoddard-Dayton.
Keystone Motor Car Co.—Packard.
Kelsey Motor Car Co.—Maxwell.
Locomobile Co. of America—Locomobile.
Motor Shop, Inc.—Oldsmobile and Stearns.
T. M. Twining—Crawford.
Gawthrop & Wister—Elmore.
Hills Motor Car Co.—Royal Tourist.
Brazier Automobile Works—Marmon.
Winton Motor Carriage Co.—Winton.
John L. Scull—Acme.
Penn Motor Car Co.—Mitchell.
Philadelphia Automobile Co.—Apperson.
Autocar Company, Ardmore, Pa.—Autocar.
General Motor Car Co.—Lozier.
Reo Motor Car Co.—Premier and Reo.
Prescott Adamson—Columbia.
Girard Motor Car Co.—American Mors and Cleveland.
International Motor Car Co.—Walter, American, Overland and Marion.
Tioga Automobile Co.—National.
L. R. French—Pullman.
Spencer Motor Car Co.—Jackson.
West-Stillman Motor Car Co.—Mercedes, and Pope-Waverly.
Pennsylvania Auto Motor Co., Bryn Mawr, Pa.—Pennsylvania.
Rittenhouse Garage—Wayne.
Carter Motor Car Corporation, Washington, D. C.—Cartercar.

Accessories.

Firestone Tire & Rubber Co.—Firestone tires.
Charles E. Miller—Accessories and sundries of all kinds.
George W. Nock Co., Inc.—Accessories.
Eugene L. Richter Electric Co.—Alternating current rectifier.
Rose Mfg. Co.—Neverout lamps.
Charles F. Kelom & Co.—Lubricants.
Brown Auto Top Co.—Tops.
B. F. Goodrich Co.—Goodrich tires.
James L. Gibney & Bro.—Tires.
Auto Equipment Co.—Accessories.
Manufacturers' Supply Co.—Accessories.
Diamond Rubber Co.—Diamond tires.
Philadelphia Auto Accessories Co.—Automobile tops and accessories.
Columbia Lubricants Co.—Oils and greases.
Puritan Soap Co., Rochester, N. Y.—Automobile soaps and metal polish.
Morgan & Wright—Morgan & Wright tires.
Autolight & Motor Supply Co.—Accessories.
Standard Rubber Tire Co.—Republic tires.
Edmond E. Hans Co., Minneapolis—Dashboard tank gasolene indicator.
Indian Motor Cycle Agency—Indian motorcycles.
Goodyear Rubber Co.—Goodyear tires.
Home Tire Co., Trenton, N. J.—Tires and hard rubber specialties.
M. L. Snyder—Rubber goods and fire equipment.

Adding Space for St. Louis Show.

Because the Jai Alai building, in which it will hold its second annual show, during the week of December 14 to 21, is too small, the St. Louis Automobile Manufacturers' and Dealers' Association, will erect another building adjoining the exhibition hall to provide room for all the exhibitors. The new building will be only temporary and will be built on the east side of the Jai Alai building with an archway in the center connecting the two. It will have the same floor space as the permanent building.

Mutual Benefits for Columbia Men.

Employees of the Electric Vehicle Co., of Hartford, have organized a mutual benefit association. Six dollars a week, not exceeding thirteen weeks in one year, and a death benefit of $50 are to be paid. The company has agreed to back the association on to a certain extent. One hundred and fifty workers in the Columbia factory signed the charter roll and elected officers as follows: President, O. C. Johnson; vice-president, R. Thomas Huntindon; secretary, W. E. McLaren; treasurer, F. D. Fay.

Milwaukee Association Abandons Show.

Members of the Milwaukee Automobile Trade Association have decided that it would be impracticable to hold a show in that city this year. When the question was discussed, a majority of the members were in favor of a show, but when it was brought out that in order to make a Milwaukee exhibit a success it would have to be held before the Chicago show, and as this would be impossible, the association voted to abandon thoughts of a show this year.

"Accessory Lifters" Busy in Chicago.

The "accessory lifters" are making their presence felt in Chicago. Ten fur coats from the Motor Car Supply Co., and nearly $1,000 worth of inner tubes from the G & J branch, are the latest reports to the police. Manager Bliss of the Rambler garage, and John Pierson, an employee, surprised the intruders at that establishment, but the burglars evaded capture and escaped.

Garden City Has a Factory Dream.

Garden City, Kan., is all excitement these days. It has a vision of an automobile factory as T. G. Musselman, of Chicago, is "in its midst," looking for a site to establish an automobile company. Musselman's company proposesh to make three styles of cars, one of them with "one-piece axle," it is stated.

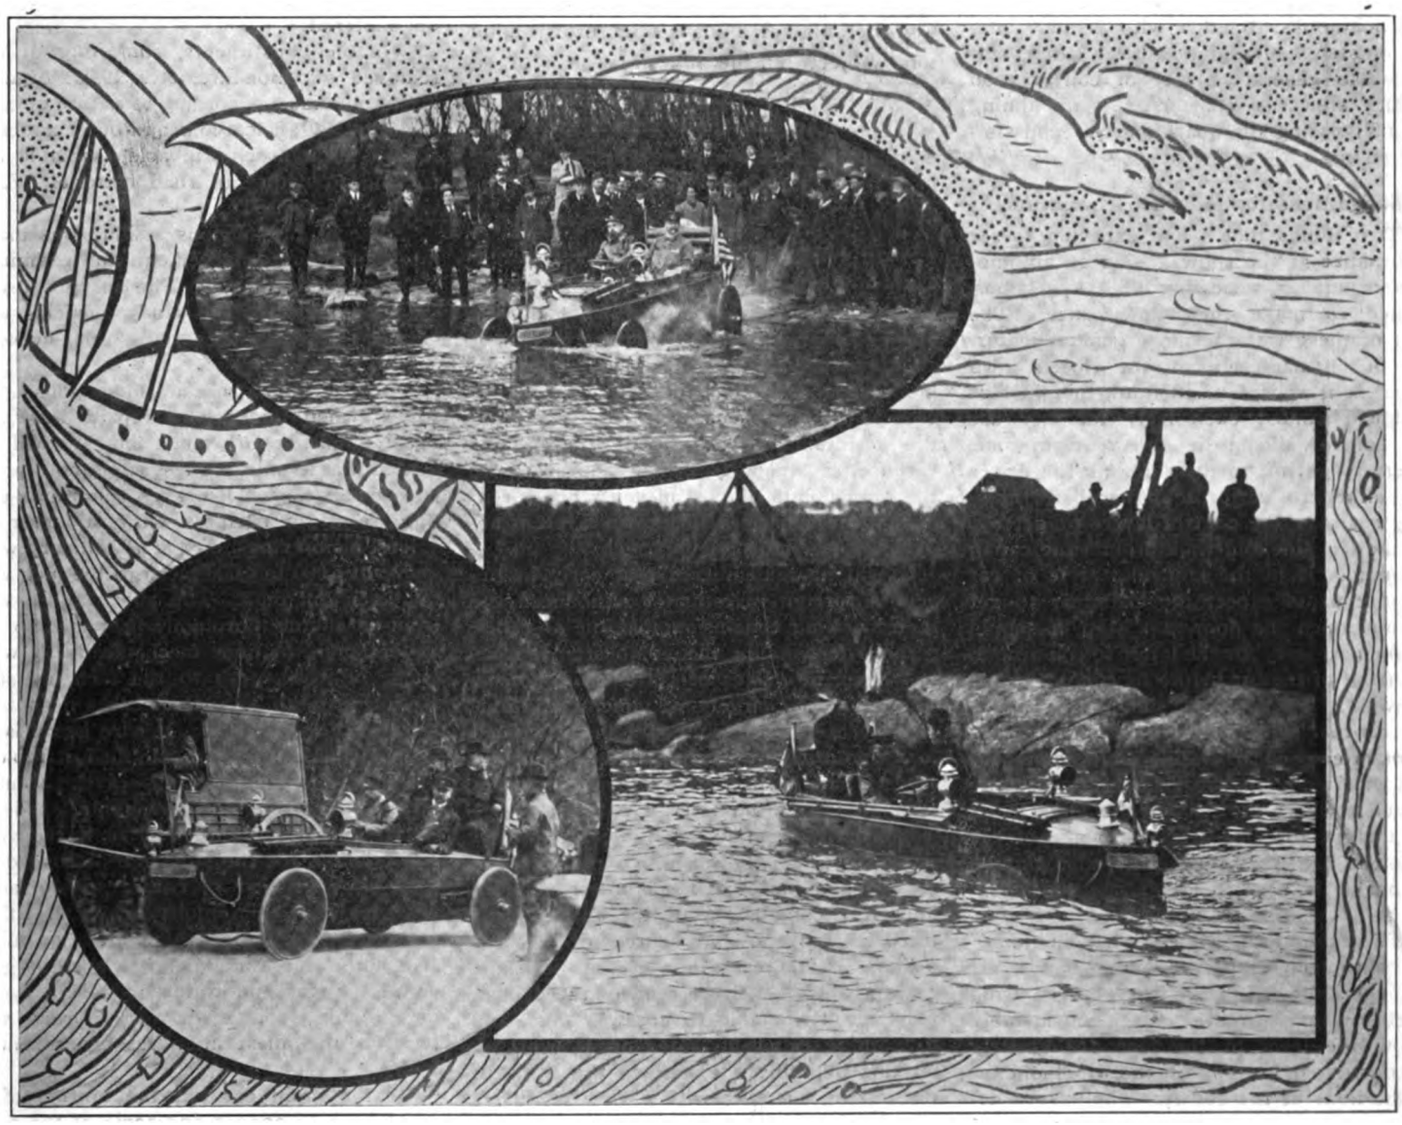
"DUCKMOBILE" ON THE HUDSON



New French Wonder Makes Its American Debut—Bowls Along the Boulevard and Rides on the River.

WaterlandI, the Jules Verneish amphibious automobile invented by Jules Reveiller, of Paris, and brought to this country two weeks ago with a view to establishing an agency here, had its first public demonstration on Tuesday last, 12th inst. Incidentally, it proved that the comic artists, who, for many years have "made game" of just such a craft, builded better than they knew. The queer craft naturally attracted considerable attention, and almost drove a chauffeur to drink when it plunged into the Hudson river at 173d street.

With the inventor himself at the wheel, a mechanicien and General John T. Cutting aft, a start was made early in the afternoon from the Oldsmobile salesroom on Broadway, where the machine had been stored. A number of automobilists and motor boat experts followed the land and water craft as it chugged up Broadway. At Lafayette boulevard the Waterland I. went up as far as 173d street, turning into the extension of Riverside drive leading to the narrow road down to Washington point.

From the drive down to the point the road is so rocky that the advance guard shouted a warning, but the pilot said in French, which was translated and passed on to the expectant newspaper men and others: "Never mind, we will proceed!" The boat-car ploughed its way through the soft sand and the momentum acquired was sufficient to carry it out into the river some distance, when the pushing of a lever set the propeller blades to churning the water almost immediately. M. Reveiller steered the craft straight out into the stream for a hundred yards, then turned it once in its length, backed, halted, cut a figure eight, and came ashore. Mrs. Julian P. Thomas, wife of the uncooked wheat bread expert aeronaut-motorist, who was standing close by, asked for a ride, and after she was seated in the stern the pilot reversed the engine and the machine backed into the water. After cutting several figures, and performing all the stunts that a well-meaning motorboat can do with propriety, it came ashore and was transformed into an automobile again.

The rig, which is of dark blue set off with bright yellow striping, is essentially a broad beam boat, with 34-inch disc wheels for land running. It is 35 feet long and 6 feet wide, and is equipped with a two-cylinder De Dion engine, variously rated at from 12 to 20 horsepower. The disc wheels are hollow to give buoyancy in the water, and are equipped with solid rubber tires for land use. The front wheels are controlled by a regular automobile type steering wheel in the cockpit, and not only govern the direction on land but assist the small rudder at the back when the boat is in the water. The rear wheels are driven by side chains; the jack shaft ends with the driving sprockets extending out of the sides of the hull, the bearings being packed to exclude water.

WATERLAND I. ON THE ROAD AND ON THE RIVER

Digitized by Google

The radiator is mounter flat along the forward deck, and the latter also bears a small capstan or windlass which is geared to the engine, so that by tying a rope to a tree on land, the boat when in the water may pull itself up the steep declivities of the shore. By one movement of a lever by the operator's seat, the engine power is changed from the driving wheels to the propeller or vice-versa. Two seats are provided, each holding two persons, the operator occupying the right half of the forward seat. Oars and boathooks, together with a small companion step ladder, give nautical fittings sufficient to generate plenty of conversation about "stewards quarters," "main dining salon," "pacing the quarter deck," and similar jesting.

Suggestions for More Improvements.

"Two things that I had expected to see materialize at the shows," said an automobile expert in reviewing his impressions, "failed to make their appearance. The first of these was the more general featuring of left-hand control for closed town cars. It is ridiculous to think that in cars designed almost exclusively for city use the control should be on the right side, where to get off to the sidewalk the driver has either to perform an acrobatic leapfrog act over the control levers or get out on the left side and walk around the car in the mud. If in the landaulet style of car the occupants expect the chauffeur to get off and open the door at a stop, it should not be necessary for the latter to run around the front of the car before he can get to the sidewalk. The control should be on the left so that he can be at the door an instant after the car stops. Left hand control is already in great vogue on electric vehicles, where the makers are alive to its advantages for city driving. Some of the gasolene light cars for city use also employ it, but it is nevertheless much too infrequent.

"The other thing which I had in mind," he continued, "is curved wind shields. It has been shown abroad that curved wind shields which have their top considerably below the level of the face are entirely satisfactory in keeping off the wind, and yet I saw none at the shows. The curved design serves to create a strong vertical upward draft in front of the driver, through which the direct wind cannot penetrate, so that while the driver has an unobstructed view of everything before him he is protected from bugs and wind by a shield of air. Very ingenious wind shields of one kind and another were shown, some of them folding over in such a way as to give almost the effect described, but none that I saw embodied the idea in its entirety. The necessary curve to be given should not be difficult to ascertainment, and once the advantages of the system become generally known there should be no difficulty in popularizing such a style, which would add greatly to the comfort of riders.

ROAD DIRT IN THE MECHANISM

Analytical Experiments of an Expert and His Deductions from Them—Suggestions Preventing the Evil.

Recent investigations have shown that the effect of fine particles of dust drawn into the carburetter of the automobile engine from the atmosphere, is far more widespread and general than had been supposed. Considerable new light is now thrown upon this subject by the investigations of a Scotch experimenter, G. D. Macdougal, of Dundee, who has gone farther into the matter than has been done before, testing first, the fine deposite found upon the walls of the mixing chamber of the carburetter after it has been in use for some little time, and second, the spent oil drawn from the crank case of a motor which had been undergoing road service. The presence of common sand in both instances, though almost unaccountable, especially as discovered in the old oil, nevertheless points to the desirability of excluding it from the carburetter air ports, which appear to be the only points of posisble entrance for it. Such a method he alludes to in a recent article in the Autocar.

It will be remembered that early in the year a foreign investigator announced the then startling conclusion that the so-called carbon deposits in the combustion spaces and over the valves of automobile motors, was composed largely of mineral and siliceous material, which could be accounted for in no other way than on the supposition that it had been drawn into the cylinder through the carburetter. Up to that time it had been supposed that the carbonization of the cylinder lubricant, coupled with a certain amount of redisuum derived from imperfect combustion of the fuel, constituted the only possible sources of such deposits. Later tests showed that in some cases as high as 90 per cent. of the deposit must be attributable to highway dust, and to nothing else. Mr. Macdougal, working on this hypothesis, examined the walls of the mixing chamber with a view to analyzing the deposit found there.

"The dust of ordinary macadamized roads consists essentially of the powdered stones or material of which the road is made, and such organic matter as may be dropped upon the road surface," says the investigator. "Road dust finds its way past the ordinary barriers against its way past the ordinary barriers against its entrance in much larger quantity than is generally supposed. If a small piece of cotton wool slightly moistened with glycerine is rolled round the end of a wire and this miniature swab brought in contact with or rubbed against the walls of the passages either leading to or from the carburetter, or against the walls of the carburetter itself, or the valve chambers of an ordinary automobile petrol engine which has been running for a little while, on subsequently pressing the cotton-wool against a microscope slide or cover glass and examining with a moderate power, a large number of sandy-looking particles will in nearly all cases be seen. Under certain circumstances sufficient of this material may be collected to allow of chemical analysis. The following figures were obtained from the examination of one specimen of swabbed out material:

"Volatile constituents, consisting of unremoved oil, moisture, etc., 19.20; organic matter (variable according to nature of road surface), 3.20; calcareous and other material soluble in hydrochloric acid (variable according to nature of road material), 7.25; sand, 70.35—100.00.

"Some of the silicious residue was made into a slide for enlargement, and examined under the microscope. The sharp and angular character of the sandy particles was clearly apparent. Regarding this, he continues:

"As a grinding or finishing polish for valves when undergoing repair, this material might be of value, but it will be agreed that its more or less continuous presence under normal working conditions can only result in needless wear and tear of valves, piston rings, etc. The ordinary wire gauze of 3,000 to 4,000 mesh to the inch will not keep out dust. The above slide was from an engine thoroughly protected so far as this could be done mechanically by wire gauze of 3,500 mesh to the inch, assisted by cotton cloth of such fineness as not to throttle the air supply. If wire gauze is of finer mesh than 4,000 to the inch, it rapidly becomes plugged up and gives trouble through throttling the air supply. Indeed,

"There is nothing to effective, in the writer's opinion, for the stoppage of road dust as a large number of comparatively large passages kept in a moist condition either with water, or, better, some sticky or adhesive non-evaporating material, such as glycerine. Sugar and water or golden syrup on suitable sponges or very porous material is the finest filter yet experimented with.

"If the drain cock at the bottom of a crank case be opened and some of the dark oil obtained and microscopically examined, there will be observed solid-looking particles of a different character as compared with those from the valves and passages. Under certain circumstances, it is possible by treating the whole of the oil contents of a crank case to separate sufficient solid material to admit of chemical analysis. One sample of such material yielded the following figures:

Volatile matter	26.87
Loss on ignition	12.34
Metallic iron	25.36
Sand	35.43
	100.00

REAL VALUE OF SPECIAL STEELS

Eames Discusses Their Place in Automobile Engineering—The Problem One of Lightness and Strength.

A great deal is heard of special steels, and their application to automobile construction. In fact it is occasionally made to appear that the car which is not built of specially compounded metals is lacking in some of the essentials of successful operation, though the suggestion is usually one of pure inference. The fallacy of this idea, however, as well as the exact purpose of the special automobile metal, and the economical limitations of its use, are brought out for the first time by Hayden Eames, of the Studebaker Automobile Co., in the following interview, in which he characterizes the use of special steels as a "craze."

"The craze for special steel is a phase through which the automobile industry at the present time is passing. It is held out as a general panacea for all ills, without care or thought as to its proper application," remarked Mr. Eames.

"The automobile engineer cannot follow formulas which hold good for a large stationary engine and which do not hold at all for the modern high-speed motor.

"The practices of modern automobile construction have been largely those of adaptation. They are, in every sense of the word, empirical, and the factor of safety is sometimes as high as 200 or 300.

"That special steels have their place in automobile engineering is undoubtedly a fact, but if they are to be valuable, if they are to bring anything to the automobile industry, it must be done by the elimination of weight.

"A car which claims a special steel for every part, when the designer has no knowledge, or to put it plainly, when there is no knowledge to be obtained that is particularly adapted for this part, is experimenting.

"To be more explicit, if a 50-point carbon steel has been found by practice to be sufficiently strong for a certain point, then nothing is gained by replacing it with a special steel unless the weight is actually reduced, and so far as I have been able to judge, this has not been accomplished.

"From an advertising point of view, the special steel proposition sounds attractive to some people. It is a talking point pure and simple. To illustrate my meaning, the Studebaker chassis is composed of steels which have been adopted and which have proved satisfactory by the best foreign manufacturers. In building, it has been our aim to produce as light a car as is consistent with strength. Comparing this chassis with other cars using so-called special steels, in almost every instance we have found our chassis to be lighter. Therefore, why make any change?

"If a bar of steel tests a certain per cent. stronger than a similar sized bar of other material, and the size is reduced on these figures alone, it does not follow that the smaller bar is going to stand up in the various stresses to which automobile parts are subjected.

"I do not want to be understood as decrying the use of special material, but I do most emphatically disapprove of blindly substituting something which is comparatively unknown, for something which has been tried by practice. Since practice only can determine its worth, I am not disposed to place any particular value upon a car composed of special steels which weighs no less than an automobile built of materials which have been proved by time and experience to be satisfactory."

Ten Commandments for Fire Users..

What might be termed the ethics of the tire problem is embodied in the text of a cleverly devised hanger which the Firestone Tire & Rubber Co. is distributing to be hung in garages and such other places as will keep it before the eyes of commercial motor vehicle chauffeurs. It is replete with hints of value to chauffeurs of every class. It is printed on heavy parchment paper in the form of a certificate bearing a large and formal looking seal, and certifies that its possessor having "the interest of his vehicle at heart, and unmindful of the yearnings of the repairman and the junk dealer," has adopted the "Chauffeur's Moral Code," as follows:

(1) I will not over-load or over-speed my vehicle, because this will be harmful to the mechanism and tires. I realize that a good rubber tire has a certain amount of "life" and if persistently overworked it cannot recover.

(2) I will always keep the brakes working evenly and the axles and wheels "trued up." I can thereby save rack and wear on my vehicle and prevent unnecessary strain on any one of the tires.

(3) I will not allow oil or grease to accumulate on my rubber tires, as this will eventually cause decay.

(4) I will never expose my tires to burning heat as the wear-resisting properties of the rubber would thus be destroyed.

(5) I will always remember to start my vehicle in a straight line before turning the steering wheel; because by turning front wheels when vehicle is standing still, a heavy and unnecessary strain would be placed upon the tires.

(6) I will start and stop my vehicle gradually and avoid jerky motions under all circumstances.

(7) I will not persist in running my vehicle along street car rails, as that would grind down the edges of the tires.

(8) I will always, when possible, choose a smooth pathway, avoiding obstacles and road irregularities; and will cross car tracks preferably at an angle.

(9) As merely resetting or repairing a tire will in many cases double its life, I will have my tires attended to promptly when damaged, in order to secure the greatest amount of service from them.

(10) And above all things, I will use my influence to have my vehicle equipped with the best tires made—"Firestone" side-wire motor tires.

PRINCIPLES OF THE SPARK PLUG

Weiss Explains Them and Specifies Causes of Misfiring—He Describes Various Methods of Manufacture.

Whatever may be the primary cause of the difficulty, the spark plug usually is first to come into question when the motor begins to miss-fire. Yet so simple is the construction of the average plug, and so excellent its behavior as a rule, that the average motorist pays little or no attention to its action or condition ordinarily, except when it fails. On this account, the following excerpts from a brief treatise on the subject recently read before the Long Island Automobile Club by Louis T. Weiss, chairman of its technical committee, is particularly enlightening. Also it explains the theory and action of a new type of plug which has lately been placed on the market, and of which great things are expected:

"Causes to which may be traced intermitent or entire stoppage of firing the mixture in the cylinders of the motor are very numerous," says Mr. Weiss, "but we shall mention only a few; such as, the fouling of the plugs, caused by lubricating oils or carbon or carbon compound deposits; the mixture of the gases being either too rich or too poor; too little voltage in the primary circuit causing sluggish action in the secondary, or high tension current; leaky wires, especially those conducting the high tension current; and last, but not least, the 'leakage,' in the plugs themselves. We ought not to say 'leakage,' since it generally is a flowing of current from one electrode to the other, instead of jumping in order to produce the desired spark. * * *

"Most of our automobiles are equipped with jump spark plugs, which necessitate a very high tension current produced either by a magneto, a spark coil, or a vibrating spark coil, the latter giving a number of sparks in contradistinction to a coil without vibrator which furnishes but one spark. In all cases, however, there is necessary a current of very high voltage, but very little ampereage or quantity.

"An electric current, like all other things, takes the path of least resistance, and it is due to this fact, that the high voltage current, of which we have so little, flows or leaks away, especially so since we try to force it to jump a gap. That we make matters worse for the current when compressing the gases which increases the electrical resistance considerably, is shown by the fact that a plug will spark in the atmosphere but not in the cylinder, or still better by the phenomenon which takes place when the porcelain outside of the cylinder is moistened, and a spark jumps from the terminal of the plug to the follower nut, or body of same, a distance of half or three-quarters of an inch, instead of leaping

Digitized by Google

across the distance between the two electrodes inside of the cylinder separated by one-thirty-second inch only.

"It seems, then, to be necessary that the insulation separating the two electrodes be a very good non-conductor of the current, and that we expose as little of its surface as possible, so as to afford as little opportunity as possible for the current to flow over, instead of jumping, even when oil or carbon are deposited on their surfaces, etc. The insulator must also stand a high degree of heat, and must be quite strong in order to withstand the rough treatment it sometimes is subjected to. Lava, mica, glass and porcelain are the principal substances which have been used.

"Lava has a very high resistance for the current, but since it absorbs moisture freely it ceases to be so when such is applied either in oil, water or gaseous mixture.

"Mica is still used with some satisfaction. Glass carries the prejudice with it of being too brittle and of breaking during the operation of screwing the plug in place, or when hot and being chilled suddenly.

"One concern, who claims to have a new process of welding it to the body, is making glass insulated plugs, which when clean of carbon, answer as windows through which you can see the fire of the explosion.

"Porcelain, however, we might say, is universally resorted to. The French and German porcelains have a reputation of being far superior to those manufactured in this country. Whether the natural product is better than ours, we do not know, but it is certain that the manner of manufacture has much to do with the quality of the finished article.

"The components of porcelain are feltspar, flint and clay. They are mixed into a plastic consistency, and in Europe, are allowed to remain many months before the plugs are shaped so that they can be turned in a lathe to the proper size and form. And, again, they are allowed to dry very slowly before they are finally fired and glazed. After baking it is necessary to allow them to cool as slowly as possible in order to avoid cracking them. By cracking, we do not mean one pronounced crack, but millions of small cracks, or pores invisible to the naked eye, but detrimental to the non-conductivity of the porcelain.. By piling up the raw material after having been mixed, and leaving it for months and months, we allow the chemical affinity of the different substances time to act and thoroughly combine into really one new homogeneous substance, resulting in a better, straighter and more uniform non-conductor when properly finished.

"We are glad to state that our American manufacturers have recently turned out porcelains for spark plugs, equally good, if not better than the imported goods."

Referring to the new type of plug mentioned, which is of novel construction, he says: "The central electrode is a platinum wire of .007 inch diameter. This wire is placed in position before the porcelain is baked, or fired as it is called. There is no opening between it and the porcelain. In order to be sure that it appears on and does not project over the end of the insulation, the porcelain with the wire in it is passed over a grinding wheel. The cross section of the platinum wire .007 inch in diameter is all from which the current can either flow or jump. The exposed surface being so small seems to not allow a flow even when entirely covered with carbon. The maker tells us that the intense heat of the current oxidizes, consumes and destroys the particles immediately on or about the surface of the platinum and at once produces a gap across which the spark appears. Whether that is so or not, we cannot tell, but if it sparks, that is enough. * * * *

"The inventors * * * claim that it is self-cleaning, and that their experiments with air cooled motor cars and many others were entirely to their satisfaction, and that neither of the four plugs missed fire after being in use many months. Also when starting a motor, other plugs having failed after cranking for ten minutes, theirs would start off on the first pull up."

Lubrication of Brake Surfaces.

Although the principle appears to be an incorrect one, it is sometimes of advantage to lubricate the working surfaces of service brakes. Many of the transmission brakes used on the cheaper grades of car have an unpleasant habit of dragging when not in use, and even a slight amount of lubrication under such circumstances tends to reduce the friction thus developed. It is on the more reliable and powerful brakes used on the larger cars, however, that lubrication is employed to best advantage. In this connection, it tends to prevent the bands from "screeching" and from gripping suddenly, and thus in the ordinary use of the foot brake, prevents the sudden pulling up of the machine, which is at once unpleasant, and injurious to the tires. When the brakes are applied hard, the lubricant soon burns off, leaving the surfaces in their normal condition and with their braking efficiency unimpaired. One well-known American maker, even goes to the length of placing a grease cup on the transmission brake band, for this purpose. In one or two other cases, a spring is introduced into the braking linkage, for the purpose of regulating the pull on the bands to a predetermined amount, and with the same end in view.

Increased Use of Block Motors.

A considerable gain in favor appears to have been made during the last two years by the block type of motor, which is now used abroad quite extensively, more particularly in chassis of the town car type. A couple of extensions of its use are now to be found in the case of the new 18-22 Darracq car, which although of the general town car type, also is suitable for light touring, and is fitted with a touring body in its stock type, while its further application in the new Miesse gasolene engine, which is of the six-cylinder variety, is remarkable because of the great length and general complexity of the cylinder casting required.

The Darracq vehicle, mentioned, is further noteworthy in that it is provided with an axle-mounted change gear, the axle being of the true live type, the main portion being of I-beam section; well cranked, while the gear case is mounted upon it, with the lay shaft running transversely of the car. The only American example of this general class of construction yet produced, so far as is known, is the new Thomas town car chassis, shown for the first time last week.

Adjustment of the Pedals.

Although many of the newer and better cars which are equipped with pedals of the push type, are provided with ample adjustments as to position of the pedals and angle of the foot plates, others are not so supplied, and consequently often prove difficult to drive when the operator does not happen to "fit" the only driving position possible to obtain. In nearly every instance, however, it is possible to alter the position of the pedals slightly, by changing the lengths of the links connecting them with brake or clutch. The angle of the foot plate may be altered to suit conditions readily enough, by drilling a couple of holes through it and bolting on a wooden block, bevelled sufficiently to secure the desired lift or pitch.

How to Loosen the Radiator Cap.

Radiator caps occasionally develop a tendency to stick just when it is most important that they should be loose enough to be removed without difficulty. When this occurs, it is not necessary to force off the offending member by means of a cold chisel and hammer, or to apply that prevalent abomination, the pipe wrench. Instead, by winding a piece of chamois leather about it and twisting the ends tightly together, a sufficient grip may be obtained to loosen it in almost every case. Incidentally, it is well not to screw the cap on too tightly when the radiator is hot, as otherwise it may tend to set when cold, and give considerable trouble.

Panhard Adopts Shaft Drive.

One of the most significant innovations of the forthcoming show season abroad, will be the uncovering of a new type of Panhard car having shaft drive. This machine, which is of 15 horsepower, and built to satisfy the requirements of town and city driving as well as light touring to a limited extent, although typically Panhard in other respects, marks the first departure of that historic firm from the traditional double chain drive to which it has steadfastly adhered heretofore.

INNOCENTS ABROAD AT THE SHOW

Wild Attempts of Artless Visitors to Explain the Things They Saw—Funny Side of the Exhibition.

"It's like trying to explain a baseball game," a friend who had just paid two dollars at the box office on "Society Night" quietly remarked to me; and he was right. He had been showing his dainty wife how a motor worked and she asked:

"Well, what part of the engine is the magnesia?"

"The what?"

"The magnesia," she repeated.

Then he told her what she meant—the magneto—the mechanism for generating an electric current to produce a spark in the cylinders.

"Well, are the shock-absorbers attached to the electric storage battery, or do they absorb shocks from the magneto, too?"

And so on down the line, even to some talk about the Winton company's Sweet "Sixteen-Six" that had never been kissed.

Motor car shows have their humorous and amusing sides, and it is this element of fun that relieves the monotony of show week for exhibitors and occasionally makes even visitors smile.

The questions that some people ask regarding certain cars and their parts, particularly inquiries made by women, while often exasperating, make life during show week worth living for the men who have to answer these queries.

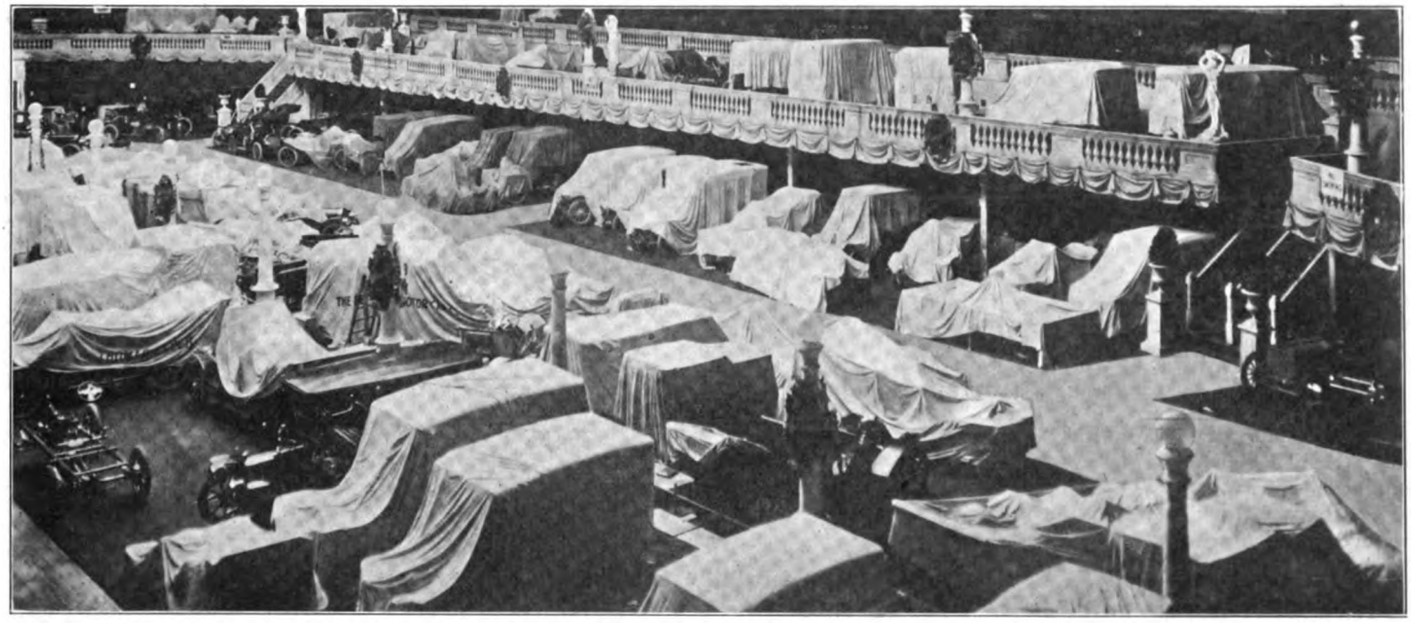
When the show opened in Madison Square Garden on a rainy Saturday night, I noticed two exquisitely gowned women meet as they entered the lobby. They rushed to each other's arms, kissed, gushed over one another, and at length, one exclaimed:

"My goodness, I never thought I should get here to-night! My car kept sliding and skidding all over the wet asphalt. That stupid chauffeur of mine forgot to put the mufflers on the tires!"

Later in the evening, one of these very women was at her escort's side, when he remarked that a certain make of plug was a very good one.

"What are the plugs for?" the dear, sweet thing wanted to know. "To keep the gasolene from leaking out of the tank?"

Numerous exhibitors wore a smile when they heard about the young girl who was so interested in six-cylinder cars. She seemed like a real, sure 'nuff motor enthusiast and uttered a few really sane remarks and asked several sensible questions about one of the Big Six models. Finally she ventured:



"I suppose they split the motor up into six sections so that a greater division of parts will make it cool more easily, do they not?"

The guards with their red coats and cream white trouserings gave a picturesque and sometimes comical air to the grand entrance. In fact when Barney Oldfield was introduced to a sales manager of one of the large companies and the latter casually asked:

"Oh, are you interested in the sport of motoring, Mr. Oldfield?" the racing driver remarked: "I suppose next I'll be taken for one of those Swiss cheese guards!"

Last year, owing to a mistake in the labeling certain photographs sent to the press, the pictures of these red-coated attendants were printed with the title "Swiss Guards" and a lot of people have not yet learned the difference.

Of course the show would not have been complete without a few wild animals in some of the exhibits. One of the Anti-Jolt Device people had one of those large, ever popular Teddy bears, which they subjected to all sorts of shocks and jars in an effort to demonstrated their product, until they were in danger of having the S. P. C. A. pounce down upon them. The Witherbee Igniter Company had in captivity a fine crop of live bees, in a large glass case shaped like a Witherbee battery, but these bees were not there for the purpose of manufacturing honeycomb for honeycomb radiators, as some of the ladies imagined. Demonstrators at the booth made this point clear.

GOOD NIGHT TO THE SHOW—THE AUTOMOBILES IN THEIR "NIGHTIES"

"You see this is the show given by the Licensed Association," a man at one of the booths explained to a young lady—a sister perhaps—who was in doubt. "The show last week at the Grand Central Palace was given by the unlicensed car makers—"

"Well, doesn't a motorist get arrested if he drives without a license?" the young woman interrupted. Further explanation was necessary.

The services of the motor car police patrol were not required. The company exhibiting this wagon kept two salesmen confined inside its wire walls at all times to show that it was thoroughly suitable and well adapted for police work.

One of the best exhibits in the light runabout class was that of the Alden-Sampson Co., who showed a road train that weighed about as much as a first-class battleship. It was a sort of ship of the desert affair, operated by electric, gasolene and several other kinds of power, applied for use in deserts and such, and had two trailers dragging behind that were a caution. When a young child saw the outfit he exclaimed:

Digitized by Google

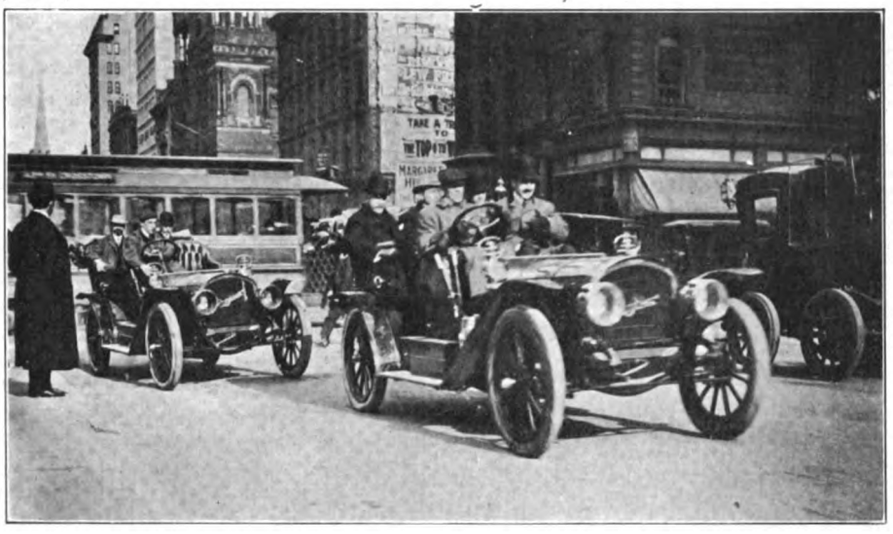
"Oh, I know what that is. That's Twenty Mule Team Borax!"

Yes, as one of the promoters of the exhibition declared, "an automobile show is more fun than a funeral."

M. W. C.

London Sees Some "Innovations."

As is usually the case, the Olympia automobile show, which opens in London this week, for a twelve days' run, will uncover a number of mechanical "innovations" the like of which have never before been seen—in England. One of these is the "Autolectric," which fulfills the following seven-fold purpose:

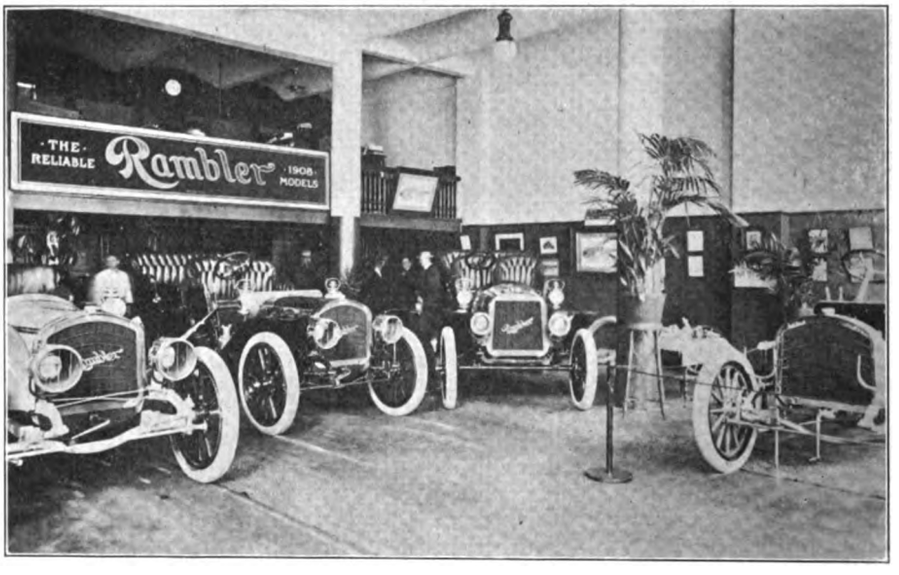


1. Automatic starting by pedal of the engine (Autolectric does the rest). 2. Ignition (high or low tension) of the explosive mixture. 3. Electric illumination of the car (lamps, powerful head-lights, etc.). 4. Electric heating of the steering wheel if required. 5. Inspection lamp for running repairs at night. 6. Electric carburation. 7. Automatic recharging of accumulators.

"Electric carburation," consists in heating the mixing chamber of the carburetter by means of a coil through which the current is passed, a further purpose being served by an "electric pump" which is used in flooding the mixing chamber by simply depressing a button on the dash. The motor is started by sending current from a set of accumulators through the dynamo, which thus becomes a motor for the time being, a special set of gears being used in driving the fly wheel. After the motor is in motion, a direct drive is established between it and the dynamo, the latter then supplying the ignition current directly and without the aid of either transformer coil or high tension distributor, a low tension circuit breaker being attached directly to the cam shaft for the purpose of distributing the current to the various plugs. Save in a few details, the system appears to be a rehabilitation of an old American idea.

RAMBLER SHOW AND AN INCIDENT

High Priests of Seldenism "Caught in the Act"—Display of the Jeffery Offerings for 1908.



What was considered a good joke on the members of the executive committee of the Association of Licensed Automobile Manufacturers occurred during the preliminaries to the Madison Square Garden Show when an enterprising photographer "snapped" the "licensed" committee members riding in an "independent" car. The protographer's success is indicated by the accompanying illustration, which shows F. L. Smith, of the Olds Motor Works; S. T. Davis, of the Locomobile Co. of America; E. H. Cutler, of the Knox Automobile Co.; Wm. E. Metzger, of the Cadillac Motor Car Co.; George H. Day, and Marcus I. Brock, assistant general manager of the Association, riding in a Rambler car from the Association offices to a private rehearsal of Tel-Harmonic music to judge of the latter's suitability as a show feature.

"LICENSED" COMMITTEE IN "UNLICENSED" CAR

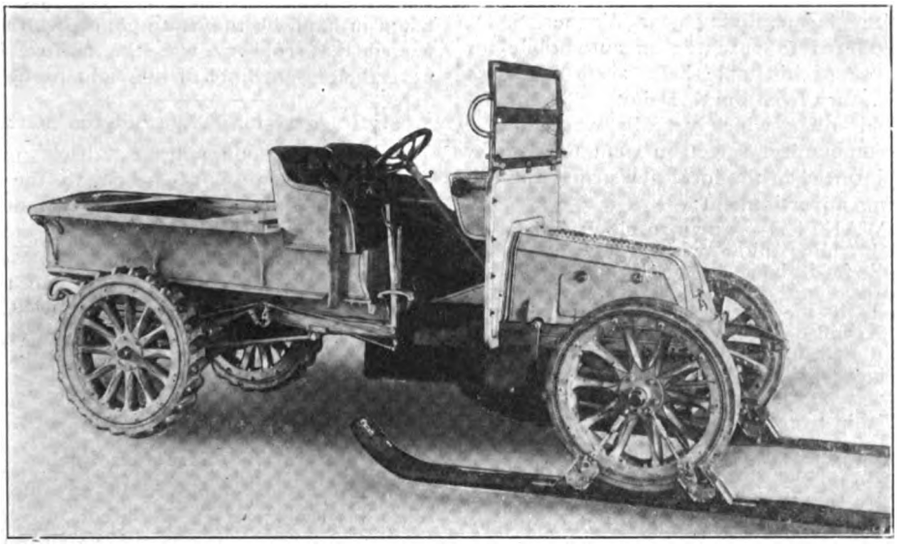
The Rambler being an "independent" car, not licensed under the Selden patent, was not represented at the Garden Show, but was exhibited during the week at a show of its own, held in the display rooms of the Homan & Schulz Co., at 38-40 West 62d street. This show the members of the Licensed Association committee were likewise given an opportunity to see. Palms and pictures were judiciously used to secure an ornate effect and a proper show atmosphere, and the 1908 offerings of Thomas B. Jeffery & Co., of Kenosha, Wis., in Ramblers of various styles were displayed to good advantage, as may be seen by the photograph reproduced herewith.

The Rambler show, which ostensibly closed on Saturday night went one better on both the Palace and the Garden shows, covering in its own way the combined period during which both of those shows were open. Practically it is a year-round show, and its essential features are open to the inspection of the public on every day in the week, from now on.

VIEW OF THE RAMBLER "INDEPENDENT" SHOW

When the Magneto Fails to Act.

When a low tension magneto refuses to act properly although the make-and-break gear appears to be in good order, the ground wire should be disconnected as a test for the insulation on the ignitor side of the circuit. If the ground wire throws an arc on being withdrawn from the frame while the armature is revolving, the ignitors being cut out temporarily, there must be a leak in the ignitor circuit.



"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

THE POLE SEEKING AUTOMOBILE

Lieutenant Shackleton's Vehicle for Antarctic Exploration Completed—Peculiar Features, Some for Camp Service.

Next to the proposal to reach the north pole by balloon the most fanciful is that of the young English naval officer, Lieutenant Shackleton, who aims to make a "farthest south" by the aid of a motor car. If he never gets any further he has gone so far as to have built an "ice motor car" which, as the illustration shows, is a nondescript, which is expected to serve some other purposes than transportation, such as melting

AUTOMOBILE FOR ANTARCTIC EXPLORATION

snow for the "explorer's" use. The special features in construction pertain, of course, to the wheels. The back wheels are shod with round bars of iron, to grip the snow. When the surface is hard and slippery spikes can be screwed into holes in these iron tires, giving the wheels a grip on the ice. The front wheels have solid rubber tires and are mounted on runners resembling elongated toboggans. A 12-15 horsepower engine, air-cooled, supplies the power, and a special feature is a pipe from the exhaust, laid under the footboard to act as a foot warmer, passing also through a small tank for the purpose of melting snow when water is wanted.

German Opinion of American Laws.

Twenty organizations were represented by one hundred delegates at the annual meeting of the German Imperial Automobile Club at Berlin on Saturday, 2d inst., according to a special cable dispatch. In discussing a proposition for the holding of an international conference for the purpose of obtaining the adoption of uniform speed regulations and license laws, which proposition was indorsed, one speaker declared that the United States would adopt such laws this winter, which may or may not prove true. He expressed the opinion that other countries would do well to copy American legislation, by which evidently he meant State legislation, as the only protection against adverse measures adopted by villages and rural authorities.

Indianapolis After a Rake-off.

Under the vehicle ordinance of Indianapolis the controller of that city purposes bringing to book about 750 local owners of automobiles who have not paid the city license fee of $3. About 1,200 Indianapolis owners are registered in the office of the Secretary of State, and only 450, in round numbers, have paid the city fee.

This ordinance was tested in the Supreme Court several years ago, and was held to be valid, in spite of the fact that it was objected to as imposing double taxation. In addition it was alleged against it that under the State automobile law a municipality may not regulate automobile ownership. The latter objection was met by the claim on the part of the city that the ordinance was a revenue measure.

Massachusetts Insists on Double Tax.

Massachusetts automobilists who have failed to comply with the requirements of the latest legislation by paying the extra license fee imposed are to be debarred from the streets and roads of the Bay State. Failing to make collections the State highway commission has issued to chiefs of police in all the cities and towns a list of the owners who have not paid, together with their license numbers. Each chief has been instructed that cars carrying these numbers cannot be operated legally on the streets and roads.

The latest grievance against the automobile is that of the people who breed carriage dogs. They claim that their business is injured.

FROM CONSTABULARY TO CIRCUS

Secret of Longmeadow's Automobile Chaser is Out—His Road Exploits a Training for Stunts in the Ring.

Charles M. Hanrattie, the constable of Longmeadow, Mass., who was the terror of automobilists so long as he was permitted by the authorities to work his traps and make arrests, is a truant officer at present. His occupation as a chaser after scorching automobiles was spoiled when law-abiding automobilists and the authorities got together to secure respect for the State law.

Since his disappearance from the road it has transpired that Hanrattie's vigilance in bringing scorchers to justice served for him a triplicate purpose—it brought him immediate emolument it afforded him training for a future vocation, and it gave him a measurable fame that may have value as an aid to popular success in that same vocation. In other words, Hanrattie as a constable was qualifying for a circus performer.

Many stories are told of Hanrattie's success in leaping from the road onto a flying automobile to make an arrest. It is said that the only automobile that ever got away from him was going at a 45-mile clip, which was a bit too fast for him. To land on a machine going at thirty or thirty-five miles an hour was a cinch, and he is said to have made his leaps in a variety of sensational ways. Once, it is stated, he leaped over the hood into the front seat and collared the chauffeur. Before becoming a constable he was a railroad brakeman, in which capacity he acquired the knack of boarding cars in rapid motion.

For some time past Hanrattie has been in negotiation with a well known big show, and his prospect for an engagement is believed to be rosy, especially as he has a "drag" with an influential member of the show management. The act in which he will appear is to include four jumps from the ground into an automobile coursing the hippodrome of the circus. He will board the car once at each end and once at each side, the star jump being over the hood into the driver's seat.

To Prison for Stealing an Automobile.

Stealing an automobile in Iola, Kan., is not as easily accomplished as one might think. Getting away with a motor car is not hard , but to retain it without knowledge of the police is another proposition. So thinks Ed Fuller, who took a liking to Dr. P. S. Mitchell's car. Fuller "pinched" the car from the garage, drove it 28 miles northwest of Iola, concealed it in the dense timber, and then went to Rich Hill, Mo., where two deputy sheriffs escorted him back to Iola. On account of his youth the judge sentenced him to a term in the reformatory.

Nullifying Local Speed Laws.

Speed restriction by local ordinance is receiving close attention from the Massachusetts State highway commission, through the activity of automobilists guarding their rights. The selectmen of Dedham named a number of points where speed was limited to ten miles an hour. Some of these were on thoroughfares traversed by automobiles traveling between Boston and Providence. After several hearings the commission decided that the restriction should apply to only three streets, and to certain short stretches.

Taunton, a much traveled city, with limits extending well out on highways where houses are far between, has an ordinance limiting speed to eight miles an hour within two miles of City Square, and to twelve miles within the city limits beyond that radius. The State commission investigated the conditions with the result of vetoing the ordinance. Automobile travel in Taunton, therefore, is regulated now only by the State law.

Chicopee Plans for Fire Apparatus.

Willimansett, which is within the city of Chicopee, Mass., has the half promise of an automobile fire-truck, the board of aldermen having passed the necessary order through the first reading stage. It will have to be a hill climber, a fact brought out in the debate, but one of the city fathers met the opposing argument, based on that fact, by suggesting that if the truck cannot negotiate the protuberance in the Willimansett section it can be transferred to another section of the city. Another interesting fact alleged during the debate was that, while it is estimated the truck and provision for its housing will cost about $6,500, it would cost $15,000 to provide horse-drawn apparatus and the accommodations for it.

Washington to Regulate Rubbernecks.

Police regulation of sight-seeing automobiles in Washington, D. C., has been undertaken by the authorities of that city. Among the regulations under consideration is one forbidding any such vehicle standing longer than fifteen minutes at a time at any place other than a public hack stand, nor at such place again until the expiration of an hour. Another rule is that no proprietor of a sight-seeing automobile shall have more than two offices within the city, and that only one car at a time shall be permitted to stand in front of each office.

Dick Turpin Up to Date.

Bold Dick Turpin and his good mare Bess would not be in it these days with the automobile. Bess wouldn't be fast enough to keep up with the procession and Dick would run chances of getting knocked skyhigh if he bounced out on a dark lane in front of an automobile. So the modern highwayman needs his own automobile. He held up William Floyd, a retired New Brunswick merchant, on a lonely road 12 miles outside of town, and not only took the victim's watch and money, but his $5,000 touring car. The merchant was driving when he heard a horn sound behind him. Instead of pulling to one side the merchant put on more speed and so did the pursuing car, the occupants of which finally shot holes in the tires of the one in front to compel it to stop. According to the tall story from New Jersey's manufacturing town, the highwaymen compelled Floyd to give up not only his money and valuables, but his touring car.

Automobiles for Farm Hands.

Finding that high wages and a country dance given in their honor did not suffice to keep hired men, Walter Smeetson, a wealthy farmer living near Wagner, S. D., has offered to purchase an automobile for the use of his male help, according to a press story from South Dakota. To emphasize his offer, which verbally was made in the community, Smeetson went to Wagner and inserted in the local newspaper the following advertisement:

> WANTED—A man to plow; will furnish riding plow with canopy top; I will feed, harness, hitch and unhitch horses and carry breakfast to him in bed; if the water doesn't agree with him, will get some from Avon that will; will also furnish him team and buggy to drive evenings and Sundays; should he prefer an automobile, will buy him one.

Within twenty-four hours after the advertisement appeared, Smeetson received applications from a dozen husky men. According to the veracious story-teller, all declined to work, however, until the automobile is brought to the farm. It is said that Smeetson has rented a car pending the arrival of a touring car that he had ordered.

Motoring for the Chorus Girls.

Chorus girls need no longer be dependent upon stage door "Johnnies" for automobile rides. The managers of the New York Hippodrome have purchased fifteen large touring cars to be used in the spectacle which follows the attraction now on the bills. Fifteen chorus men, or near-actors, as they sometimes are called, will manipulate the cars on the stage of the hippodrome. The new spectacle is billed to begin in a couple of weeks, and in the meantime the cars will be used to advertise the attraction. Every morning at 10 o'clock, when the chorus girls go to work, they'll be loaded in the cars, which work they will not shirk; then they'll be joined by other girls from all Shubert possessions, and cavort up through Central Park in mighty gay processions.

Land for San Mateo Boulevard.

The San Mateo Automobile Club, which is engaged in an effort to build an automobile boulevard from that place to San Francisco, has received from the San Mateo Improvement Co. a lot of land valued at $800 as a contribution in aid of the project.

Motorphobia Incites to Crime.

That motorphobia may develop into crime was illustrated in the arrest at Mildale, Conn., of two well known men charged with attempting to wreck automobiles on the bridge there. During the preceding night timbers forming the rail of the bridge were pried off and piled near either end of the bridge in the roadway. An automobile striking either pile would inevitably have been overturned, and its occupants would almost as surely have gone into the river. The men arrested gave as an excuse their hatred of automobilists who, they said, were reckless of the safety of people on the roads. The obstructions were discovered by C. W. Blately, who was driving his car very slowly and struck one of the obstructions without sustaining any damage. The case was taken in hand by the State police, who suspected that robbery was the motive, but nevertheless got hold of the right parties.

Big Registration in Washington State.

Old Dobbin soon will be a back number in Washington, according to the reports of the county assessors in that State. The assessors have been trying to locate all the automobiles and horses in the State in order to assess them for taxes, and they found 721 cars, which they valued at $448,700. They must have missed some as 1,032 registration numbers have been issued. The total valuation of all kinds of horses in the State is $10,281,673.

Natural Gas Serves as Fuel.

Natural gas is employed by an automobilist at Medicine Hat, Assiniboia, to drive his car. According to the tale, no alteration has been made in the original machinery, but a tank to carry compressed gas has been added, with a tube connecting it with the carburetter. Medicine Hat is somewhat off the main line of travel and the name itself is quite suggestive of pipe dreams.

Motor Cars for Piano Delivery.

An automobile delivery car specially designed for carrying pianos has just been put in commission by the Mason & Hamlin company of Boston. It is two-cylinder, 16 horsepower Knox, built to order, and has capacity for two grand pianos at once. It is said that with this vehicle a delivery that formerly took half a day can be completed in two hours or less.

Vanderbilt Cup Winner Burned.

According to telegraphic reports from Ottawa, Canada, the car which won the last Vanderbilt cup race met an unhappy fate. Lord Hale, of Pembroke, its present owner, was touring in Western Quebec, when the car caught fire. It was destroyed.

Houston's garage employees and chauffeurs have formed the Auto and Motor Boat Company, for social purposes. At the organization meeting sixteen mechanics were present and signed the charter roll.

FARMER ADVOCATES BETTER LAW

Massachusetts Grange Official Working to Bring Agriculturists and Automobilists Together—New Law the Aim.

Among movements for bettering the automobile laws of Massachusetts one that aims to bring together two elements supposed to be largely at variance is being engineered by former State Senator M. A. Morse, of Belchertown, a lecturer of the State Grange. Mr. Morse is engaged in an effort to get the automobilists and the farmers together, through the State Grange, for discussion of the problems connected with the use of roads, with a view to having introduced in the legislature a new automobile law satisfactory to all parties. The matter of "closed" roads is one that would be carefully considered, with the object of devising means to make the exclusive enactments of such towns as Nantucket unnecessary and impossible.

Mr. Morse has found that many of the farmers believe automobilists should be permitted to go as fast as they please on straight stretches of road, where there are no hidden crossroads or where there would be no danger to residents or property; but they believe that the speed at curves should be limited.

The matter will be brought before the State Grange during the annual session in Pittsfield in December and Mr. Morse will endeavor to have a committee of farmers appointed to meet a committee of automobilists. The latter committee he would have appointed, if possible, by the automobile associations. The two committees would be authorized to frame a general automobile law, and by presenting a united front, Mr. Morse believes the automobilists and farmers would be able to secure satisfactory action by the legislature.

Damages Claimed for Injured Tree.

Whether J. Frank Hale's car skidded "wilfully" on a public highway in Hingham, Mass., and damaged an ornamental shade tree is the weighty question that will be thrashed out in district court November 1st. The charge was preferred by Tree Warden Arthur W. Young of Hingham, in behalf of the town, and is the outcome of an accident on Lincoln street early last summer, when Hale's car skidded and banged into an elm tree, wrecking both the tree and the car.

Rotten Bridge Causes Law Suit.

Charging neglect in allowing a bridge to get out of repair, Edward Lawrence, a Joliet (Ill.) automobilist, has brought suit against the village of Channahon, Ill., for $1,000. Lawrence and a party were crossing the bridge over the Dupage river some time ago, when one of the spans gave way and the car and its occupants were plunged into the river. Lawrence and a Mr. Larson, of La Salle, were nearly drowned. The Rambler car was badly damaged, so that Lawrence's estimate of damage seems unusually reasonable.

Speeding Not an Offense.

"On the charge of reckless driving the defendant could not be convicted on the mere fact that he was going at a high rate of speed, unless there was evidence that there was much traffic in the highway as to show danger to human life," declared Judge William B. Stevens in court at Plymouth, Mass., recently, as he charged the jury in the case of the State vs. Andrew N. Winslow, of Newton Centre. Winslow was found guilty in the district court on charges of reckless driving, overspeeding and refusing to stop when ordered by an officer. He was given a three months' sentence, but took an appeal on all counts. The jury acquitted him on two of the charges, but sustained the finding of the lower court on the charge of refusing to stop when ordered to do so.

Wholesale Remission of Fines.

That one good turn deserves another was exemplified a few days ago by the action of Mayor Rice and the city commissioners of Houston, Tex., in remitting all fines assessed in the corporation court against automobilists, the remission being made without solicitation. None of the offenses charged were of a serious or wilful nature. The local automobilists are on the best of terms with the city authorities, and during a recent visit of foreign spinners they responded with alacrity to the request of the mayor and the reception committee to give the visitors a joy ride.

Appeal Against a Prejudiced Jury.

Prejudice of the trial jury against automobiles, or "benzine buggies," as they termed them, will result in a new trial in the case of Mary Sorenson against Clarence Wheeler, in the district court at Omaha, Neb. The plaintiff secured a verdict of $849 for damages sustained in a collision between her bugg and Wheeler's automobile. Because the jurors were manifestly prejudiced against automobiles and took no pains to conceal their dislike, Wheeler has asked for a new trial, which likely will be granted.

Alabama Automobile Bill Dead.

The Blackmon automobile bill, as it was called, which passed both the House and Senate in Alabama, died of strangulation on the governor's desk. The measure was drafted and introduced by Senator F. L. Blackmon of Calhoun county and the most important feature of it was the provision that would have caused motorists to stop whenever meeting a horse or mule. The measure went through both houses but it was not approved by the governor.

JUDICIAL NARROWNESS REBUKED

Severe Construction of the Law's Letter Disallowed on an Appeal—Decision Relative to "Stop" Signal.

Narrow reading of a law may mar the intention of the enactment, according to a recent decision of the Indiana Supreme Court. The decision reversed the judgment of a lower court which quashed an indictment charging Samuel Goodwin with failure to stop his automobile on signal. The affidavit set forth that Rosa and Josie Case, driving in a buggy on a highway in DeKalb county, met Goodwin traveling in an opposite direction in an automobile, the latter ignoring Josie's signal to stop. Rosa, who was driving, was using both hands in the effort to control the frightened horse. The lower court held the affidavit insufficient because the signal was not given by the driver.

Judge Hadley of the Supreme Court, in reversing this judgment, said it is obvious that the legislative purpose in enacting the law "was to provide protection to travelers on the public highway by vehicle, from the dangers incident to the animal attached to such vehicle becoming frightened at the approach of an automobile. There could have been no reason for the law makers to have designed a greater protection for the driver, or director of the animal, than for other occupants of the vehicle, who would be equally exposed." The court was, therefore, as Judge Hadley expressed it, "unable to give the statute the narrow and severe construction contended for by the appellee, and which seems to have been placed upon it by the court below."

After illustrating what "driving" means in its popular sense, Judge Hadley declared that even a strict construction of the law "would require us to hold that any occupant of the vehicle may give the signal. A contrary construction would be without the letter as well as without the spirit of the statute.

"It would seem highly unreasonable, if not absurd, to so interpret the law as to exonerate the driver of an automobile who refuses to heed a signal of distress on the ground that it was not given by the driver in person. Such a rendering would give immunity in many aggravated cases especially aimed at by the statute, where, as is alleged in this case, the driver becomes so engrossed by his efforts to restrain the frightened animal as to be unable to give it.

"It is hardly too much to say that it was the legislative view that when a driver of an automobile is appealed to to stop, when approaching a vehicle drawn by a frightened animal, if his sense of moral or social duty is not strong enough to induce him to do so, the rigor of the law should be interposed."

The Week's Patents.

864,141. Compressed Air Cushion Mechanism for Automobiles. Thomas F. Scott, Everett, Mass. Filed June 14, 1906. Serial No. 321,772.

1. In an automobile, or other road vehicle, the combination with the body and a wheel axle, of a vertical piston cylinder with closed heads, vertical standards fixed to the underside of the body, means suspending the piston cylinder on and between said standards for it to swing in a longitudinal vertical plane on the body, a piston-head in said cylinder, a piston rod extending from the lower side of the piston head to and through a stuffing box of the lower closed end of the piston cylinder, means hanging the piston rod on the wheel axle for it to turn in a longitudinal vertical plane thereon, a by-way or passage connecting the opposite end portions of the piston cylinder, a regulating valve in said byway, an opening at which to charge the piston cylinder, and means to open and close said opening, all for operation, substantially as described for the purposes specified.

864,364. Motor Vehicle. James Forrest, Spokane, Wash. Filed Aug. 23, 1906. Serial No. 331,812.

1. In combination with the axle of a vehicle, driven wheels journaled thereon, gear teeth upon said wheels, a vehicle frame having elongated slots in plates forming a part of said frame and through which slots said axles are adapted to pass, the frame being designed to have a slight vertical movement independent of the axles, means for limiting the upward movement of the frame, shafts carried by the frame, and gear wheels fixed to said shafts and in mesh with the teeth of said driven wheels, as set forth.

864,375. Wheel Rim. Ernest Hopkinson, East Orange, N. J. Filed Sept. 13, 1905. Serial No. 278,329.

1. The combination in a wheel rim, of a main rim member provided on its outer face with a rabbet to receive and form a seat for one margin of a tire sheath and a contractible and expansible side flange cooperating with said main rim member to clamp the margin of the tire sheath in said rabbet, said main rim member and said removable side flange will effect the clamping of the margin of the tire sheath.

864,409. Roller Bearing. Ellsworth J. Edwards, Los Angeles, Cal. Filed Oct. 24, 1906. Serial No. 340,305.

1. In combination, a plurality of rollers, two annular members, one adjacent each end of said rollers, journals carried by said members and in engagement with said rollers, and means in engagement with the outer surface of one of said members and the inner surface of the other member for spacing the members and holding them in position.

864, 409. Roller Bearing. Elsworth J. Edwards, Los Angeles, Cal. Filed Oct. 24, 1906. Serial No. 340,306.

1. A roller bearing, comprising an inner cylindrical bearing sleeve, an outer cylindrical bearing sleeve, collars semi-circular in cross section carried by each of said sleeves, a plurality of bearing rollers having cylindrical body portions in engagement with both of said sleeves and rounded end portions in engagement with said collars, each of said bearing rollers being provided with a plurality of circumferential grooves intermediate its ends, and means for spacing said rollers, said means comprising a plurality of intermediate rollers having circumferential flanges adapted to engage with the grooves of said bearing rollers, and having rods or journals connecting said circumferential flanges.

864,412. Device for Testing Explosive Engines. Harvey C. Estep, Aberdeen, S. D. Filed Aug. 20, 1906. Serial No. 331,342.

1. In combination, a cylinder for explosive engines having admission and exhaust ports, an ignition device adjecent one end of the cylinder, a piston within the cylinder movable toward and away from the ignition device, a duct leading out of the cylinder, the mouth of the duct being uncovered by the piston adjacent the end of its outstroke, and a manually controlled valve in the duct.

864,413. Lens Fastening for Lamps. Ernest C. Everett, New York, N. Y., assignor to R. E. Dietz Company, New York, N. Y. Filed Nov. 20, 1905. Serial No. 288,194.

1. In a lamp, the combination of a lens, a surrounding supporting frame, supporting rods connected at their inner ends with the lens, and individual fastenings which connect the outer ends of the several rods separately with said frame and which are ra-

dially adjustable, thereby enabling the lens to be focused with reference to the flame, substantially as set forth.

864,534. Air Cooled Engine. Neville E. Harris, Port Huron, Mich. Filed Dec. 2, 1904. Serial No. 235,186.

1. The combination with a cylinder of an explosive engine, of a casing or jacket surrounding the cylinder and inclosing the head thereof, a plurality of tubes extending from the sides and head of the cylinder to said casing and communicating with apertures in the casing, each of said tubes having a lateral opening therein, and means for causing the exhaust from the cylinder to create a current of air through said casing and tubes.

864,586. Gasolene Engine. Le Roy Wottring, Prospect, Ohio. Filed Sept. 17, 1906, Serial No. 334,999.

1. In a device of the character described, the combination with a gas engine cylinder, of a head which closes the lower end of said cylinder, a fuel conduit leading to the lower portion of the cylinder, a check valve located in said fluid conduit and opening inwardly, a hollow piston slidably disposed in the cylinder, said piston having heads which close its upper and lower ends, a check valve opening inwardly which is carried by the lower head, and a check valve opening outwardly which is carried by the upper head.

864,623. Driving Gear for Motor Vehicles. William H. Douglas, Belleville, N. J., assignor to Healey & Co., New York, N. Y., a Corporation. Filed Sept. 26, 1906. Serial No. 336,254.

1. In a motor vehicle, the combination with an axle having stub axles and wheels journaled on the stub axles, said wheels being provided with internal gears, a motor supported on the axle, and pinions in mesh with the internal gears, means in connection with the stub shafts for supporting the pinions, and double universal joints between the shaft of the motor and the pinions.

864,324. Flexible Shaft. William H. Douglas, Belleville, N. J., assignor to Healey & Co., New York, N. Y., a Corporation. Filed Sept. 26, 1906. Serial No. 336,255.

1. A flexible shaft, comprising a plurality of knuckles, each having sets of rigid lugs extending longitudinally from one face of a knuckle, and diametrically extending pivots each held in one set of lugs and engaged by a set of lugs of the adjacent knuckle the outer face of said knuckles being screw threaded and a spiral spring resting in the threads.

864,625. Brake Mechanism. William H. Douglas, Belleville, N. J., assignor to Healey & Co., New York, N. Y., a Corporation. Filed Sept. 26, 1906. Serial No. 336,256.

1. A brake mechanism comprising a brake wheel, a brake band, a fixed support on which the middle portion of the brake band is secured to form two independently flexing side arms for braking engagement with the inner face of the rim of said brake wheel, a fabric covering on the brake band, and a clamping bolt for clamping the cover to the face of the said band, said band having a recess for the reception of the covering material under the head of said bolt.

864,626. Controller for Driving Gears. William H. Douglas, Belleville, N. J., assignor to Healey & Co., New York, N. Y., a Corporation. Filed Sept. 26, 1906. Serial No. 336,257.

1. The combination with the steering post and the controller for the driving gear, of a sleeve provided with a handle and slidable on the post, a gear journaled on the lower end of the post for actuating the controller, said gear being provided with spaced lugs on the upper face thereof, said sleeve having pins for engaging between the lugs, a fixed collar encircling the sleeve, said collar being provided with parallel slots extending in opposite directions, a pin on the sleeve for engaging the slots, said slots being arranged in different planes and being connected at their adjacent ends by a transverse slot, said transverse slot corresponding to the position of the pin when the controller is at zero position, whereby to provide a positive stop for the controller at said zero position.

12,686. Fluid Gauge. Morris Martin, Malden, Mass., assignor, by mesne assignments, to Boston Auto Gauge Company, Boston, Mass., a Corporation of Massachusetts. Filed May 22, 1907. Serial No. 375,176. Original No. 794,675, dated July 11, 1905, Serial No. 233,329.

1. In a fluid gauge, a tank, a bushing sustained thereby, a head having a pivot, a magnetic needle mounted thereon a float guide depending below said head, a rockshaft having a magnet secured to its upper end, a float controlled by said float guide to turn said shaft, and a ring nut to clamp the head on said bushing in any position in which it may be set when adjusting said head and magnet on said bushing.

THE LARGEST AUTOMOBILE SUPPLY HOUSE IN AMERICA

THE MILLER AUTOMOBILE JACK

The Miller Automobile Jack is a quick acting, automatic lowering jack, designed especially for automobile use and is adapted to the factory or garage, as well as to be carried as a part of the equipment on motor cars. The Miller Jack is constructed of the best material and every part is machine finished, and in material, workmanship and finish it is a high grade and one of the finest finished jacks on the market.

We guarantee this jack for 12 months, and at the price, it is the best value ever offered to the automobile trade.

We are in a position to quote a special price to manufacturers, jobbers and dealers who buy in quantity.

The list price of the Miller Jack, guaranteed for 12 months, $3.50 each.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or woodwork of any kind. It will remove stains, cover scratches, leaves the automobile with its original new lustre, without being sticky or greasy.

It can be used on the leather seats or tops with the very best results. Can be used on any color or kind of varnish, from the clearest white to the darkest black.

Furnished in eight-ounce bottles. Guaranteed not to harm the finest varnish. For sale by all automobile dealers. Price, 60 cents per bottle.

Catalog, largest of the kind, mailed on request.

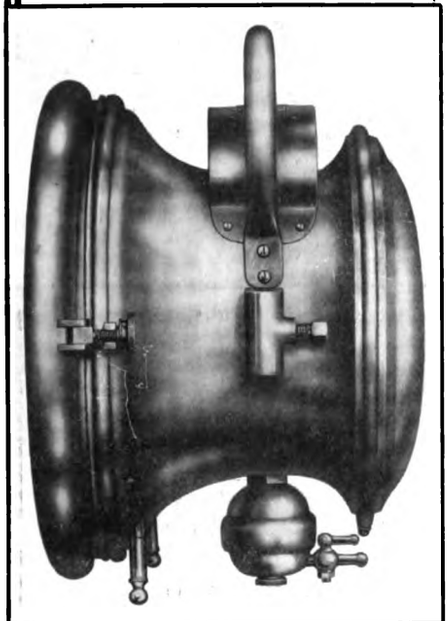
which have become so well known to the automobile world and which have gained such great favor among their many users, are now being manufactured in the best equipped plant in the world devoted to the exclusive manufacture of Magnetos. This new factory, a model from the standpoint of efficient arrangement and high class equipment, together with perfected designs which are the results of years of experience in this line of manufacture, makes possible the turning out of the very highest grade ignition apparatus on the market.

For 1908 our line includes a new high tension Magneto without coil, which we build in large quantities and are selling at a medium price. It is simple, small and well made. It can be installed with minimum expense and is a high grade equipment in every respect. We also build Magnetos with coils for double ignition, and alternating and direct current Magnetos for all ignition purposes. It will pay you to investigate our Magnetos before deciding upon your ignition equipment for your 1908 cars.



We will exhibit at both New York Shows and the Chicago Show.

When the Glidden Tour Ended

It was found that

3 Out of Every 4 Tourists

had used

Warner Auto-Meters

Yes, sir; of the 48 cars that finished at New York in this year's Glidden Tour, exactly 36 **carried Warner Auto-Meters.** Just think of that! **Three times** as many **Auto-Meters** were used by these **experienced motorists as** there were of **all other** speed-and-distance indicators **combined!**

This **sweeping victory** for Warner Auto-Meters, followed **last** year's **equally** creditable performance in the Glidden Tour, and the recent notable triumphs in the **Chicago Sealed Bonnet Contest** and the **Boston Endurance Race,** establish beyond the possibility of a doubt that the Warner Auto-Meter is the **only** speed-and-distance indicator that can be **depended** upon to do the work right at all times and under all conditions.

Accurate as a Watch—Reliable as a Compass

Warner Auto-Meters are made on the **proven-successful** magnetic principle. They're just as **reliable** and **durable as a mariner's compass.** No matter how **rough** the road, you can tell **at a glance exactly how fast** you are going. The arrow **never** flutters or bobs back and forth. The Warner Auto-Meter is as **accurate** as a watch.

You ought to have an Auto-Meter on your machine—it **doubles** the pleasure of autoing, helps you to **control** your machine and **frequently** saves embarrassing situations in the **police court.**

You'll notice the handsome little Auto-Meter on **most** of the best cars. Take a **look** at it; inquire about it—nearly **all** automobile dealers sell **Auto-Meters.**

Write us the name and power of your car, and we'll tell you just what it will cost you to put an Auto-Meter on the dashboard.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

TIRE LOGIC

MEN who are careful in their selection of tires usually choose a tire that is carefully made by experienced conscientious makers. We believe that this Oval Raised Tread is the best automobile tire made. Many men call it "The Tire of the Day." We know that if you'll give one G & J tire a fair, square trial on your automobile, you'll soon equip it with a whole set, ¶ Are you willing to trust us? Will you make the trial? Will you write for prices? ¶ We build our Oval Raised Tread Tire with the famous Non-skid, non-side-slip Midgley Tread if desired. We can also supply you with the new 1908 Universal Midgley Rim.

WINTON

To Own Such a Car

is to own a kingdom. That's what the hero of "A Six-Cylinder Courtship" says in the Saturday Evening Post.

You'll feel like saying the same thing when you ride in the self-starting Winton Six-Teen-Six.

Combines the **sweetness** of electricity and the **flexibility** of steam with a **greater efficiency** of the automobile motor than was ever before achieved.

Goes through traffic from a crawl to a dash without change of gear. Takes hills on the high where fours drop back to second. Quiet, sweet running, plenty of reserve power. Goes the route **like coasting down hill.**

Precisely the car for the man who wants the best there is.

Fully equipped when you get it.

First Gun

For the 1908

Single Cylinder

Cadillac

Greenville, S. C., Nov. 8, 1907.

CADILLAC MOTOR CAR CO.,
Detroit Michigan.

Gentlemen:—I want to tell you how perfectly delighted I am with the Model T 1908 Single Cylinder Four-passenger Cadillac received a few days ago. I have never seen an engine with such snap, vim and energy. She takes hills like a four-cylinder—and how any man can want anything better—I can't see. This new car rides like a Pullman—and has all the speed and power any reasonable man can possibly want. I must say—I am surprised myself, though I have been a Cadillac enthusiast for years. It is the most magnificent running car I have ever sat in, and on the road this afternoon I passed cars costing more than twice as much, easily. I have examined this car carefully and tried it thoroughly and I do not believe you can make an improvement in it anywhere. Yours truly,

EUGENE F. BATES.

The price of the Model "T" is $1,000. It is the same dependable, constant and economical car that the single cylinder Cadillac has always been, only for 1908 it is better than ever.

Cadillac Motor Car Co., Detroit, Mich

Member of Association of Licensed Automobile Manufacturers.

THOMAS

THE E. R. THOMAS MOTOR CO. presents four styles of chassis and nineteen styles of bodies

Thomas 4-20 Town Car

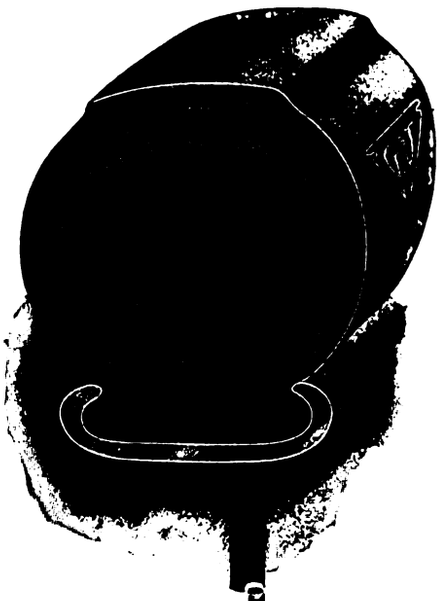
Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, $3,000 to $3,250.

Thomas 4-40 Detroit

A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse at a much lower price, shaft driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, $2,750 to $3,750.

Thomas 4-60 Flyer

The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, landaulet and limousine bodies. Prices, $4,500 to $5,700.



Thomas 6-70 Special

This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, $6,000 to $6,900.

"Run it on the Scales"

Don't buy your automobile without having it weighed. Light-weight means net ability and low expense.

Unnecessary weight means loss of power. Repair bills. Gasoline bills. Tire expense. Awkwardness. Discomfort. Danger.

Every pound of superfluous weight means more work for your engine to do. Your horse-power doesn't do so much—less speed, slower work on the hills. What's the use of buying high horse-power and throwing it away on weight?

A heavy, complicated, water-cooled engine has more to get out of order than an air-cooled engine—that means more repair bills. A heavy automobile injures itself by jarring. That means more repair bills. A heavy automobile wears out tires fast—more expense.

A heavy automobile is hard to manage—that means danger.

There is no comfort possible, under average touring conditions, with a heavy stiff-frame half-spring machine.

The 16 h. p. Franklin touring-car at $1,850 weighs 1,600 pounds; the 28 h. p. at $2,850 weighs 2,200; the six-cylinder 40 h. p. at $4,000 weighs 2,500 pounds.

"Run it on the scales." Weigh your automobile—of whatever make—before you buy it.

Send for 1908 Catalogue.

Mr. Motorist:

You may think this egotism—but it's not.

Morgan & Wright Tires are making a big hit with the motorist because they continue to make good.

Here is what one motorist has to say about good tires.

POLAND SPRINGS, MAINE, Oct. 11/07

MORGAN & WRIGHT, DETROIT.

Gentlemen:—Six weeks ago today we left Detroit with our 1908 Packard equipped with your tires; we have crossed the Green Mountains once and the White Mountains twice and have been thoroughly over Maine, New Hampshire and Vermont roads, we have had two punctures on the entire trip, we register today 3284 miles and our tires today look as good as the day we left home.

If your tires last like this what is to become of your repair department? And what's the use of carrying extra casings on our machine? Very truly,

F. E. WADSWORTH.

THE HOL-TAN Automobile

THE HOL-TAN Company, for many years sole importers of the FIAT cars in America, begs to announce that it will close out remaining models of this make at *greatly reduced prices* and hereafter will devote its entire energies to marketing the new HOL-TAN Car.

In 1906 we became aware that some of the American cars were conforming closely to European standards in mechanical excellence and that the American demand was for a car of moderate horse power, cost and up-keep.

We therefore reduced our importations of FIATS and requested Mr. Louis P. Mooers, the well known American engineer, to design for us a model to be known as The **HOL-TAN** Car, which should incorporate those principles and refinements which our experience had shown to be most satisfactory to our former customers.

After a year's work we are now able to offer to the public a satisfactory American car at the right price, **$3000.**

The chassis is made in two models with the same engine in both.

The HOL-TAN STANDARD, Wheel Base, 110 inches, is adapted to open touring car bodies for five passengers or for any Runabout or Roadster design.

The HOL-TAN SPECIAL, Wheel Base, 121 inches, will take a touring car body seating seven or a cab, coupe, landaulet or limousine.

The car is manufactured for us by the Moon Motor Car Co. of St. Louis and includes the following special features:

Motor, 4-cylinder, 4½ x 4½, 25 H. P. with valves in the head.
Ignition, Bosch high tension magneto. Cellular radiator.
Multiple disc clutch. Direct drive. Mooers selective four speed gear.
Drop frame, permitting full elliptic springs in rear.

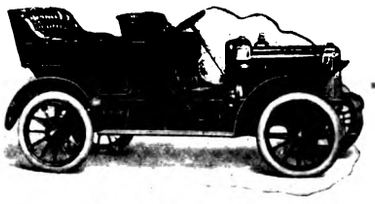
THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE



WRITE FOR THE NEW WHITE CATALOG

We would like to send a copy of our new catalog to everyone interested in any phase of motoring. Everyone should read, for example, the description of the White generator, that wonderful steam-making device wherein the water is at the top and the steam at the bottom and wherein none of the conditions of the ordinary boiler are present. The references to the continuous success of the White in all forms of competition during the last seven years will also prove of interest. Also, we invite attention to the detailed specifications of our two models—one of 30 horse-power and the other of 20 horse-power—with touring car, runabout, limousine and landaulet bodies.

24 H. P.—$1.750.

Do you know why this new 4-cylinder 24 H. P. "Maxwell" can be sold at a price heretofore unheard of in cars of equal size and power?

Because never before in the history of automobiling have touring cars been manufactured on such an enormous scale—and because Mr. J. D. Maxwell, who has designed and perfected the entire "Maxwell" line, has always kept foremost in his mind the fact that the average citizen is not a millionaire.

You know the record of this car. It is an exact duplicate, mechanically, of the famous Deming Trophy Winner of 1906 and Pilot of the Glidden Tour of 1907.

It offers to the man of moderate income all the motoring pleasures enjoyed by the plutocrat—it gives all the efficiency of cars costing infinitely more at an operating cost far below that of any other car of equal size. It costs $1,750.

The 14 H. P. Tourabout at $825 and 20 H. P. Touring car at $1,450 uphold the standard of "Maxwell" efficiency at "Maxwell" prices. The universal satisfaction these cars have given is evidence of "Maxwell" supremacy.

I want you to know this **NEW "MAXWELL"**—ride in it—get a "Maxwell Convincer" at your convenience. Address Dept. 2.

The Purchase of An Automobile

has become a purely business transaction in which the returns in satisfactory service, reliability and economy of maintenance are balanced against the investment.

From the standpoints of economical maintenance, absolute reliability and minimum depreciation in market value, the

Rambler

stands preeminently the gilt-edge investment of the industry, a position won and held through years of satisfactory service.

The 1908 models mark the nearest approach to mechanical perfection ever attained.

Our advance catalog, now ready, will show you how and why and a demonstration will convince. Both are at you service. Write today or see the nearest Rambler representative.

THE MOTOR WORLD

Volume XVII. New York, U. S. A., Thursday, November 21, 1907. No. 8

KANE CLAIMS HE WAS "STUNG"

Purchased a "Guaranteed" Second Hand Car and Trouble Followed—Now Wants His Money Back.

The Times Square Automobile Co., New York, which on occasion is said to have caused the rival firm of Morris & Ginsberg to turn green for envy, has been made the defendant in a suit of the sort which caused their rivals to be advertised by many "loving friends." John J. Kane, of Brooklyn, is the plaintiff in the case, and his tale does not differ greatly from those of others who have bought not wisely nor well.

The Times Square concern deals in job-lots and second hand cars and also cars, the manufacturers of which, for various reasons, prefer to be sold outside the usual channels. The Times Square people are wise in their generation and know how to talk of "guarantees" or "warranty" in just the right way at just the right time, and otherwise to drive a bargain in effective style.

Kane was attracted by one of their alluring advertisements and, of course, he was duly impressed by the conversational guarantees. He bases his suit on an alleged breach of warranty and seeks damages to the amount of $2,678.45, made up of $1,200 as the first cost of the car he purchased, and the balance for repairs. Mr. Kane is an old and well known resident of Brooklyn. In his complaint he states that he went to the defendant company on or about April last to buy a second-hand touring car. He had seen the company's advertisements, he said, that appeared in the newspapers, and was shown a beautiful car at the company's place of business. This car, he was informed, he says, had cost $3,000 and had only been run 500 miles. It was in first-class condition, he says he was told, and had only been in use for three months.

There was some bargaining as to price, and Kane made the indirect acquaintance of the stern, but finally relenting, owner who so often figures in sales made at "second hand emporiums." He says he was told that the owner wanted $1,800 for the car, but he was finally told he could have it for $1,200. He paid for it, and, he alleges, it broke down five times on the way over to Brooklyn. He says that the car has been in the repair shop most of the time since he had it, except when it was breaking down with him somewhere in an out-of-the-way place. He has got a good car now, he says, but it cost him more than the price of a new one.

In his prayer for relief the plaintiff asks that the defendant corporation be compelled to take back the car and refund the purchase money, together with the sums he has laid out for repairs.

Dolson Finally Forced to the Wall.

The prolonged financial straits of the Dolson Automobile Co., Charlotte, Mich., culminated on Friday last, 15th inst., in the filing of a voluntary petition in bankruptcy. Three Chicago creditors with claims aggregating $1,000 are responsible for the petition being filed. The book value of the assets are said to aggregate more than $250,000, with unsecured indebtedness amounting to about $140,000. C. B. Hathaway, representing the Muncie Automobile Parts Company of Muncie, Ind., has been made custodian of the plant pending the appointment of a trustee.

Receivership Marks Okey's Quick Finish.

As the result of failure to meet notes for $3,000, C. M. Chittenden, the surety for the paper, on Thursday last, applied for the appointment of a receiver for the Okey Motor Car Co., Columbus, Ohio. Chittenden also alleged that the company's liabilities exceeded its assets. The court named George W. Smith receiver. The Okey company was organized only in January last with $25,000 capital, but if ever it actually built any cars they did not get very far from Columbus.

THE WAYS OF THE PROMOTER

One of the Conspicuous Examples of Means Used to Attract Investors—Impressive Language and Figures.

The "ways of a man with a maid" are probably as queer to-day as they were in Solomon's day, but they are as nothing compared with the ways of the promoter with the "golden opportunity." Such unheard of stores of optimism as he has to draw upon must create envy among the down hearted, but it will be cheering, indeed, for automobile manufactures in general to learn that while they have been worrying over their business problems they have been making money hand over fist, no matter what their books may show. No less an authority than the Carter Motor Car Corporation, of Detroit, Mich., and Washington, D. C., for instance, incidental to preparing the minds of its "prospects" for stock purchase, makes the following statement as to conditions in the automobile trade:

"The purchase of automobile stock is a plain, commercial proposition, not a speculation. One automobile company is paying annually $1,500,000 in profits and is making millions for its stockholders. Several automobile concerns are paying from 100 to 300 per cent. on but recent investments, while all other automobile companies are paying from 10 to 300 per cent. dividends. The man who invested $1,000 in an automobile company only eight years ago, now has a snug fortune of $200,000, and is receiving in annual dividends the sum of $25,000."

The feature of the Carter's promised product is the equipment of two engines per car. Just the manner in which this brilliant conception came to the inventor is dwelt upon interestingly and to some length in the company's literature. It cannot well fail to be of interest to the now pitiful single engine makers and devotees,

Digitized by Google

as showing by what fortune they came thus to be put in a hole. Listen to it:

"Despite the fact that rapid transit annihilates distance, from time immemorial throughout the endless succession of centuries, the inventive genii of the world have failed to rise to the demands of trade and commerce, merely seeking an acme of transportation within the time-worn limitations. Finally the noisy nineteenth century railroad car, a cold, methodical, mechanical proposition, whether engine or cable driven devoid of ethical interest save as a mere mode of transportation, made its appearance. Following rapidly came electrical systems for rail and vehicle, and finally the automobile, outdistancing all predecessors with its powerful yet single engine; still the eminence of perfection was not quite reached, one more step forward seemed requisite ere the crowning height would be attained.

"Great epochs of history are conserved by notable dates honored and celebrated throughout the civilized world; to-day's transpirings but enrich the field of future memory. As the Fourth of July, 1776, commemorates our absolution from the thraldom of monarchy, so hereafter will the nineteenth of May, 1905, be remembered as the birth of an epoch of transportation unparalleled in the history of the world, the day upon which Howard O. Carter conceived the acme of motor car perfection, the now famous Carter Two-Engine automobile.

"On May 19, 1905, when miles from home, 'mid moaning pines and grim-visaged rocks, upon a road suffering from a generous outpouring of Jupiter Pluvius, Mr. Howard O. Carter, the inventor of the now famous Carter two-engine car, found himself completely at the mercy of a balky engine which no amount of coaxing could satisfy. Completely fatigued and thoroughly disgusted with the unavailing efforts to continue the trip homeward, the inevitable was accepted, and, after a weary trudge to an electric line, relief and civilization were finally reached.

"The humiliation of the event had so worked upon the hospitality of the gallant host that the 'mother of invention' came to the rescue. The conception came, it began to grow, and, like Mr. Finney's turnip, made famous by Longfellow, it grew and it grew, until to-day we present to the motoring public and to the world the conception perfected, the Carter two-engine automobile. Henceforth, when the host of any autoing party seeks his way through the wilds of the mountain canyons, or winds along the beautiful shores of a river or lake, whether in mid-day or at midnight, he will be absolutely certain of reaching his journey's end, because never more will he pin his faith to a poor single-engine car.

"After weeks of unremitting toil, despite seeming insurmountable obstacles and the derisiveness of auto 'experts,' the theory of a two-engine car was reduced to a practical working model which possessed indisputable points of advantage over all other makes, embracing qualifications absolutely unattainable by others. This triumph caused the so-called 'experts' to view with wonderment this marvel of the auto age. The success in inventive achievement was enhanced when without the disallowance of a single count Mr. Carter received upon his invention exceedingly broad patents, thereby insuring to him the reward of his labor and genius.

"As the moth flies to the flame so now did the scoffer and capitalist alike seek Mr. Carter. Without solicitation numerous flattering offers were made for the control of his patents; but, considering the faithfulness of the few, who in the early days of doubtfulness, when success hung in the balance, were 'friends in need' and who should share in the glories of victory, none were accepted. The formation of an independent company was deemed preferable. Accordingly, upon conservatively laid plans, the Carter Motor Car Corporation was organized and subsequently incorporated under the laws of South Dakota. The capital stock was placed at $2,000,000, with the par value of the shares within the reach of all, namely, $1.00. * * *

"As great oaks from little acorns grow, so from a modest beginning the future seemed destined to eclipse the most sanguine anticipations of the few who had thrown their lot with the vicissitudes of motor car construction. Buckling to a strenuous stock selling campaign, for the purpose of erecting a factory in the vicinity of Washington, the public soon became aware of the pecuniary advantages in the owning of Carter Motor Car Corporation stock, and without hesitancy there was inaugurated a tide of rapid purchase in blocks ranging from 50 to 5,000 shares. The original quotation of 50 cents per share met with popular approval. This campaign of personal solicitation developed so satisfactorily, a broader plan of publicity was decided upon and in the Washington press of January 13, 1907, there appeared the first advertisement offering our stock to the general public at the above quoted price. The result was magical. Inquiries and applications for options began to pour into the offices of the company. Not alone were the responses local, but from far distant States, even Canada and far away Cuba. The future was assured.

"The field before us is unlimited. As yet it has been practically untouched by auto makers, and the success of our company therefore is doubly assured. The extreme unreliability of single-engine cars has been the bugbear in the motoring world. It is just that difficulty we have surmounted. Observing this fact, our order list from prospective purchasers of cars (of every description) is growing daily—the output for the current season having been entirely sold.

"In each and every statement herewith made, either of fact or by comparison, we have endeavored to hew to the line of truth, letting the chips of disconcertion for our competitors fall where they may. We invite the closest scrutiny of both our car and our claims, whether it be a stock or machine purchasing proposition, feeling no hesitancy as to the outcome."

Stock purchase, incidentally, carries with it the privilege of in turn selling stock on commission to one's friends.

Interior Refinements in Closed Cars.

The interior refinements that have been evolved in closed cars recently is well illustrated in the case of the Quinby bodies, all of which now are supplied with individual card cases for man and wife, cases for stationery, a fountain pen, a note book and a clock. Not a few other limousines have been fitted with complete toilet and manicure sets and individual lunch sets to say nothing of speaking tubes, electric lights and other conveniences, while Quinby & Co. have also built several big bodies which, in addition to all the other appointments, include lavatory and toilet accommodations with running water and a large mirror occupying half the roof, which may be let down when milady desires to discover whether her hat is on straight or whether her nose requires a dab of powder.

Maxwell's Belief in Alcohol Fuel.

J. D. Maxwell, of the Maxwell-Briscoe Co., is so firmly convinced that alcohol will be the automobile fuel of the future that he has set aside a special building at the Tarrytown factory, in which experiments are carried on, and has placed a large order for denatured alcohol with a Tacoma concern which is beginning the manufacture of industrial alcohol from sawdust, a raw material that is obtained practically without expense in the lumber regions of Washington. Mr. Maxwell has also designed a special carburetter, which when applied to Maxwell cars will vaporize gasolene, kerosene or alcohol with equal facility.

What Impressed President Studebaker.

J. M. Studebaker, president of the Studebaker Co., who recently returned from abroad, states that the two things which most impressed him were the number of enclosed cars in use and the number of American tourists who were driving American cars. Of the high grade cars he saw on the roads, Mr. Studebaker believes that at least two-thirds of them were fitted with enclosed bodies.

General Machinery Co. Succeeds Smalley.

The Smalley Motor Works, Bay City, Mich., disposed of recently at a receiver's auction for $26,250, has been reorganized as the General Machinery Co. The stockholders elected G. W. Ames, N. A. Eddy, C. F. Eddy, and E. C. wen, directors, who in turn elected Ewen president, C. F. Edy vice-president, and N. A. Eddy secretary-treasurer.

IN THE RETAIL WORLD.

Edward Mallory, John McCammon and Eber Hotchkiss have opened a garage at Topeka, Kas.

The Whitten & Gilmour Co., which recently was formed to handle the Thomas car in Boston, has established itself at 909 Boylston street.

The St. Paul Motor Vehicle Co., 184 Western avenue, St. Paul, Minn., suffered a slight fire on November 11th. The blaze was extinguished after it had scorched one car.

W. M. Jenkins & Co., Boston agents for the Mitchell, have moved from 304 Columbus avenue to No. 268 on the same avenue. More elbow room made the change necessary.

Five cars were destroyed in a fire that gutted the stable building owned by M. W. Whitney & Co., at Albany, N. Y., Sunday last, 17th inst. The total loss was over $50,000.

Luce & Banks, of Grand Rapids, have sold their North Division street garage to W. S. Farrant. The new owner has taken the agency for the Ford, formerly handled by the Richmond-Jarvis Co.

E. A. Grady and Victor Mills have purchased the garage and business formerly conducted at 418 Santa Fe avenue, Pueblo, Col., by E. A. Griggs. The new owners will continue the business as heretofore.

George F. Kehew has entered the retail trade in Chicago, having secured the agency for the Pope-Hartford. The Orlando F. Weber Co., which previously handled that car, will devote itself wholly to the Pope-Toledo.

The Times Square Automobile Co. has found New York City too narrow for its operations. In consequence, the company has opened a branch for the selling of second hand cars at 309-311 Michigan avenue, Chicago.

A negro porter employed at the garage of the Acme Automobile Co., 3044 Olive street, St. Louis, never again will attempt to scrub the floor with gasolene. He knows the difference between it and water now. A visitor to the garage dropped a match in a pool on the floor while William was scrubbing out, thinking a puddle of water was the safest place to drop a match. The employes and firemen succeeded in getting $50,000 worth of cars out of the garage before much damage was caused.

Factory for Each Maxwell Type.

Despite the practical completion of the big Maxwell-Briscoe plant at Newcastle, Ind., it appears that there is no likelihood of the immediate or entire abandonment of the factory at Tarrytown, N. Y., where, indeed, a 350-foot addition is in course of erection. Following a visit of Benj. Briscoe to Newcastle, it is announced that the plant at that point will be devoted to the two-cylinder Maxwell and the Tarrytown works to the four cylinder model, while the runabouts will be built at Pawtucket, R. I.

Berg Seeks to Block the Transfer.

Charles Berg, a stockholder of the Commercial Truck Company of America, Philadelphia, has filed a bill in equity to restrain the officers of the company from conveying its plant in Blair county to H. S. Kerbaugh, Incorporated. Berg declares that the officers of the company, despite his protest, passed a resolution authorizing the conveyance of the plant, Kerbaugh agreeing to deliver to the Commercial Company $100,000 worth of stock of the concern. Berg insists that the property is worth far more and that the officers had no legal power to authorize the conveyance and that this is vested in the stockholders.

St. Louis Personal Property for Sale.

The trustee for the St. Louis Motor Car Co., Peoria, Ill., is inviting bids for the purchase of the tangible personal property of the bankrupt. The property includes machinery, office fixtures, raw material and several finished and unfinished automobiles. Tenders will be received up to November 22. Meanwhile the referee is taking testimony on the claim of Sears & Burgess, former agents in Chicago for the St. Louis car, who seek to recover $8,000 for commissions and alleged damage.

Duplex Ignition is Short Circuited.

Following the filing of a petition in bankruptcy, John Grunberg has been appointed receiver for the Duplex Ignition Co., makers of spark plugs, etc., at 307A West Thirty-sixth street, New York. The chief petitioning creditor was Fritz Lowenstein, president of the concern, whose claim for money advanced amounts to $1,075. Leo Lowenstein is the secretary-treasurer.

Pratt Out of the Cadillac.

J. Elmer Pratt, for so many years W. E. Metzger's right hand man in the sales department of the Cadillac Motor Car Co., Detroit, has resigned his office and for a while at least purposes indulging his penchant for life in the open. Pratt is such a hard, earnest worker, however, that he scarcely is likely to long remain out of harness.

Willyoung Absorbed by Westchester.

The Westchester Appliance Co. has taken over the Willyoung Appliance Co., of Yonkers, N. Y., makers of ignition specialties, etc. The new concern, which was incorporated last week under New York laws, with capital stock of $125,000, will continue the business at the old stand.

Leather Goods Go up in Flames.

The plant of the Leather Tire Goods Co., Newton Upper Falls, Mass., of which Woodward Bros. are the proprietors, was destroyed by fire last week. The loss aggregates $50,000.

THE WEEK'S INCORPORATIONS.

Beloit, Wis.—Beloit Automobile Club, under Wisconsin laws, with no capital. Corporators—F. M. Strong, L. F. Bennett, W. A. Goss, and H. M. Vale.

New York City, N. Y.—Manhattan Taximeter Co., under New York laws, with $5,000 capital. Corporators—Cecil P. Stewart, Arthur A. Stewart, and Arthur Cleve, all of New York City.

Newark, N. J.—National Automobile Transit Co., under New Jersey laws, with $25,000 capital; to deal in automobiles. Corporators—W. S. Muchmore, William Lochenberg and Lorenzo Habby.

Buffalo, N. Y—Thomas Motor Cab Co, under New York laws, with $50,000 capital; to manufacture automobile cabs. Corporators—E. R. Thomas, Edwin L. Thomas and Arthur Z. Mitchell, all of Buffalo.

Springfield, Mass.—Bullard Specialty Co., under Massachusetts laws, with $100,000 capital; to make speed registering instruments. Corporators—J. H. Bullard, president; A. C. Fairbanks, treasurer, both of Springfield.

New York City, N. Y.—Hillside Motor Car Co., under New York laws, with $40,000 capital. Corporators—Joseph A. Jones, 115 Palmetto street, Brooklyn; Marion S. Sears, 88 Madison avenue, New York City; Robert McC. Robinson, Jamaica, N. Y.

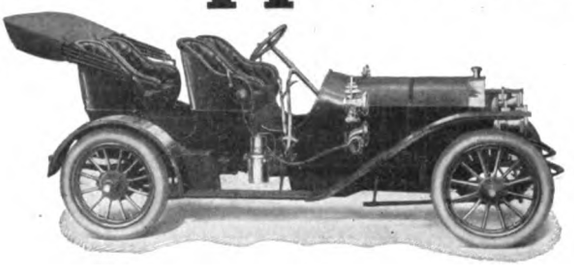
Yonkers, N. Y.—Westchester Appliance Co., under New York laws, with $125,000 capital; to manufacture ignition appliances. Corporators—William H. Cornell, M. Casewell Heine, 76 William street; John L. Lockwood, 60 Wall street, all of New York City.

New York City, N. Y.—National Taxicab Co., under New York laws, with $25,000 capital. Corporators—W .Bernard Vance, 128 Willoughby avenue, Brooklyn; George A. Knoblich, 198 Broadway; Woodford Mowbry, 251 Washington avenue, New York City.

Cedarhurst, N. Y.—American Battery Co., under New York laws, with $200,000 capital; to manufacture batteries of all kinds. Corporators—W. H. Orr, 230 East 179 the street, New York; I. T. Kortz, 297 Waverly avenue, and H. F. Rhatigan, 424 Prospect place, Brooklyn.

Studebaker Branch in Philadelphia.

The Studebaker Bros. Co. of New York have established a branch house in Philadelphia for the handling of the Studebaker cars, both gasolene and electric. It will be in charge of A. J. King, who formerly was connected with the Keystone Automobile Co. of Philadelphia.



Fire Damages Two Dayton Firms.

Fire last week in the Stoddard building, Dayton, Ohio, caused some damage to the plants of the Dayton Motor Car Co., and the Kinsey Mfg. Co. The loss, however, was slight, not exceeding $5,000 in each case. The fire was caused by a live wire.

NEW YORK, NOVEMBER 21, 1907

The Chicago Show Numbers of the Motor World will bear dates November 28 and December 5.

Concerning Double Ignition.

With the generally increased use of double ignition as applied to cars of the better class, a question naturally arises as to whether the advantage gained is sufficient to repay the added cost of equipment. Evidently it has been answered in the negative by a number of makers, inasmuch as their magneto equipments are made only on specification. Others, who specify the magneto with the regular equipment of the car also make it a practice to include the battery or accumulator and coil service, without extra cost to the purchaser.

Except for the magneto and the use of double wiring, the additional cost of the complete double ignition is not significant. That is to say the increase in cost of one set of spark plugs and high tension leads is not of material importance in itself. The question to be decided then, is as to whether the magneto is sufficiently reliable to warrant its application without the use of an accessory equipment as a standby, and whether the so-called double ignition really proves in practice to provide the actual duplicate system it promises.

On this point, there is reason for grave doubts. For where two sets of sparking plugs are in use, the idle set, being constantly exposed to the play of oil and soot in the cylinders without the clarifying influence of the spark, is liable to foul, and in road service generally is found to be out of order when its service is required. This being the case the process of shifting from one set of ignition to the other involves more than the simple throwing of the master switch. In fact, it usually involves the removal and cleaning of one or more of the plugs which have been standing idle.

Where a single set of plugs is used with two possible sources of primary current, on the other hand no such difficulty exists. Plug trouble is discernable at once, since the same sort of failure developed with one source, holds good when the other is tried. A brief test at the terminal connections on the motor, or on the coil box then is sufficient to locate the seat of trouble absolutely and beyond question. More than that, while the cost of secondary wiring is not of material significance where large and well equipped cars are under consideration, the complication which it involves is of some little moment. Hence, all things considered, the double plug system may be considered as not being altogether advantageous, and indeed, superfluous.

As to the question of reliability, several years of abundant use of the high tension magneto, and the low tension arrangement used in connection with the high tension transformer, has given ample assurance of the suitability of either arrangement for continuous and rigorous service. Its suitability may no longer be questioned. The difficulty of starting the motor under magneto ignition, however, gives sufficient reason for applying the extra battery service to cars of large power, and in which no question of economy of first cost enters. As a standby, batteries are not altogether satisfactory in this connection, since their lower current capacity is not always sufficient to produce a good spark in plugs which have been supplied with magneto current for any length of time. Either system is satisfactory in itself, and either is suitable by itself. The additional security of the double system, while considerable, would hardly seem to be sufficient to compensate for the cost of equipment, however, except in such cases as already mentioned, where economy is not a material consideration.

The Matter of Bank Credits.

At this time, when tight money is the rule, almost anything that promises to relieve the tension is of interest. It follows that a Wall street view of the conditions existing in the automobile industry merits at least some notice. A view of the sort is contained in a bulletin issued by a firm of Wall street accountants, which treats the subject with intelligence and which so far as the matter of credits is concerned, says:

"One of the gravest mistakes of many concerns in the automobile industry has been in attempting to operate on too small working capital. Many such companies have been started with insufficient invested capital, sometimes because of the actual lack of capital and sometimes because of the lack of information as to the large capital requirements necessary to insure success in the automobile industry.

"Starting with insufficient invested capital, demands for additional capital have rapidly increased and the concerns have found it necessary to secure outside aid to protect the integrity of their investment and handle an increased volume of business.

"In many instances, they have made the mistake of borrowing funds instead of taking capitalists into partnership, their desire being to retain as large a share of the anticipated profits as possible. This has resulted in the danger of a large floating debt —current liabilities far in excess of current assets. There was a time when it was comparatively easy to secure large investors in almost any concern in the automobile line. To-day it is far more difficult. To those concerns who are over-extended we would advise the early retirement of their current liabilities, even at a sacrifice.

"On the other hand, there are many concerns who are entitled to reasonable bank accommodation, and who could use such funds safely and to profitable advantage. Banks are slow to encourage new industries by credit extension and many automobile manufacturers have found it difficult to negotiate loans to the extent they believe

Digitized by Google

their bank balance and credit entitle them. As the whole automobile industry progresses in conservative administration and strengthened financial position, and as bankers familiarize themselves with the conditions of this line of business, the easier will it become to secure propore bank credit.

"The best policy for the individual manufacturer seeking credit, is to shape up his financial position, systemize his business methods and thoroughly organize his factory. The careful examination of the books and affairs and report thereon by a reputable professional accounting firm, preferably specialists in the automobile industry, tends to gain the necessary confidence of bankers."

Of course the obvious object of the bulletin is to secure employment for the "professional accounting firm" that issued it, but whether or not the services of a concern of the sort will prove a short cut to extension of credit, there is no doubt that there is much of sage counsel embodied in its views.

Is It a Sport or a Business?

It is not strange that the all powerful Amateur Athletic Union has put up the bars against the American Automobile Association type of "amateur." It was almost inevitable that the first time his standing should be called into question that the A. A. A. "amateur" would receive his proper brand.

Sport is sport, it matters not what implement may be used in its pursuit and the man who engages in it for the money it may net him, or who places himself on the same level with the cash chaser, has no right to the title amateur. He is a professional and should be so stamped and the attempt of the A. A. A. to close its eyes to the fact is as condemnable as its effort to set up a caste definition by making, not racing for cash, but the nature of a man's occupation, the chief distinction between professionalism and amateurism. That sort of thing savors of snobbery in its worst form. It might be rather embarrassing for a man of means to find himself pitted against his former chauffeur, or some other man's chauffeur, but to hold that he may so compete and yet remain an amateur, while the workingman is, ipse facto, a professional, is ridiculousness of the side-splitting sort.

The so-called "gentleman amateur" long since so thoroughly merged with the misty past that he is part resurrection. The amateur definition applies to all men without distinction of whatever sort and the sooner the A. A. A. realizes the fact the better it will be for the sport of automobiling and the less its own position will be compromised and made appear inconsistent. Possibly the action of the Amateur Athletic Union may assist in quickening the A. A. A. conscience. As the A. A. A. rules themselves further declare a professional to be one who has been so stamped by other governing bodies and as the rules of all such bodies make competing for cash or against professionals the chief foundations of professionalism, the fact that the A. A. A. practically "outlaws" all who engage in competitions under its own provisions is manifest to any man with half an eye, and shows the full inconsistency of its position.

Because a millionaire who desired to pose as an amateur sportsman and yet despite his unlimited resources wailed that "automobile sport is expensive," and urged therefort that money prizes were necessary—because this sort of alleged amateur had to do with moulding the A. A. A. rule is no sound reason for its continuance. There is no disgrace in racing for money. The shame of it is in permitting the men who want it or who need it, and who race for it, to masquerade as amateurs. There is further shame in that A. A. A. rule which legalizes the use of assumed names in order, if they find it necessary, that competitors may deceive their families or life insurance companies, or both.

Automobile competition is either a sport or a business and the distinction should be made clear. It is assumed that the A. A. A. considers it to be a sport, and if this assumption is correct, it should be placed on the basis of sport, of which amateurism is the fundamental principle. When the A. A. A. performs that act, it is likely to discover that the sport will become not the pursuit of the tradesman, but a pastime for the private owner, who is its bulwark and who should be encouraged by every means possible, but whose interest now is wet-blanketed by the rules that offer him no inducement and afford him small chance for successful competition.

Motor Print certainly knows good things when it sees them, but when so very many of them are "lifted" from the columns of the Motor World it would seem that the re-Print's conscience would be pricked sufficiently to give credit where credit is due, say at least once in a hundred cases. It may be very kind to regularly "borrow" page after page of matter and to hold it until it is thoroughly seasoned—or half forgotten—but then to parade it under big black headlines as the product of professors or engineers with high sounding and fanciful names is—well, "2 mutch," especially when the practice is continued for a year or more.

COMING EVENTS

November 26, 27, 28, Chicago, Ill.—Chicago Motor Club's three days' 600-mile reliability run.

November 28, Wilmington, N. C.—Automobile races on Wrightsville beach.

November 28, Riverside, Cal.—Annual hill climbing contest on Box Springs hill.

November 30-December 7, Chicago—National Association Automobile Manufacturers' first annual exhibition of commercial motor vehicles in 7th Regiment Armory.

November 30-December 7, Chicago—National Association Automobile Manufacturers' Annual show in Coliseum and First Regiment Armory.

December 7-14, San Francisco, Cal.—Automobile Dealers' Association of California's second annual show in the Coliseum.

December 9-14, Detroit, Mich.—Detroit Automobile Dealers' Association's show at Wolff's pavilion.

December 14-21, St. Louis, Mo.—St. Louis Manufacturers' and Dealers' second annual show in Jai Alai building.

January 14-18, Hartford, Conn.—Hartford Automobile Dealer's Association's annual show in Foot Guard Hall.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sportsmen's Association's show in Light Guard Armory.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's show.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association show in Duquesne Garden.

Press agents are very useful persons, but receipt of an item of the kind impels us to remark in all kindness that however impressive, it behooves the p. a. to leave unheralded reports of fast performances between New York and Philadelphia, or between any other points entailing travel in New Jersey. That State is possessed of a lynx-eyed Commissioner of Motor Vehicles and publication of reports of the "sort" are known to have attracted his attention and to have made very much more than a peck of trouble for several men in the trade.

SEVEN MADE PERFECT SCORES

Fourteen Survivors in New Jersey 24-Hour Endurance Run—One of the Contesting Cars Destroyed by Fire.

Covering 472 miles over road that varied in condition from the finest macadam to a mere path across a swamp, without a repair or replacement, without involuntary stop of engine and on schedule time is the notable record of seven cars in the 24-hour endurance run promoted by the New Jersey Automobile and Motor Club, which finished in Newark, N. J., Saturday afternoon, 16th inst. The seven cars with perfect scores and their drivers, were: Matheson, John B. Ryall; Locomobile, R. A. Greene; Oldsmobile, Ralph R. Owen; Franklin, F. C. Tinni, Jr.; Thomas, Montague Roberts; Ford, A. T. Purcell, and Haynes, R. G. Kelsey. The Haynes and the Ford were runabouts; the other five touring cars. The lucky seven cars that finished will be awarded silver loving cups. Of the 22 cars that started in the contest Friday afternoon, fourteen survived the twice-around-the-clock contest, the others having been withdrawn for a variety of reasons.

SCENE AT THE FINISH, SHOWING NEWARK'S INTEREST

Mayor Hausling, of Newark, fired the starting gun that sent the first car, Ryall's Matheson, on its way at 2 o'clock Friday afternoon, and the others left at one minute intervals. There were thirteen touring cars and nine runabouts, C. E. Johnston's Continental failing to put in an appearance. This contest of the New Jersey organization was the most unique and undoubtedly one of the most strenuous endurance contests that has ever been held in this country. The drivers were required to keep going continuously for 24 hours over a five-lap circuit. Arriving at a control more than three minutes behind or ahead of schedule meant a loss of two points for every minute, and to keep to schedule during the night was hard work. The other points considered were: To stop motor between controls without making an adjustment or repair, 3 points per minute; to stop car on last circuit without making repairs or adjustments, 3 points per minute; to stop motor for purpose of making repairs or adjustments, 4 points per minute; to repair car or make replacements with motor running, 2 points per minute; to drive car in a circle to delay passing final control, 2 points. Double penalties were imposed when the driver received assistance in making repairs or adjustments.

TYPICAL NEWARK CROWD AROUND A WINNING CAR

The course was from the club house in Newark to Bloomfield, Glen Ridge, Montclair, Verona, Caldwell, Pine Brook, Parsippanny, Denville, Dover, Kenvil, Mount Freedom, Morristown, Benardsville, Far Hills, Bedminster, Somerville, Bound Brook, Plainfield, Springfield, Irvington, and back to the club house. This circuit was traversed five times.

Stories without number could be told about the accidents and incidents, amusing and serious, that went to make up the contest, but none would surpass in interest the tale of the late night and early morning hours of Friday at the club house. All the flotsam and jetsam of Newark that never goes to bed, and hundreds of other persons who do ordinarily, made a night of it. There was much that was fascinating about the cars as they came in from the rounds, with their powerful searchlights throwing streams of white haze hundreds of feet ahead, and then the bustle and activity incidental to filling tanks, changing crews, and so forth. Down in the grill fur-coated drivers, student observers and officials, snatched sandwiches and cups of coffee while their cars were being filled with gasolene and oil, to be off again a minute later. As the night lengthened and the changes of drivers and crews occurred, the scene became more animated. At frequent intervals some belated motorist would stumble into the sleeping room on the top floor, where thirty cots had been set, and drop off into slumber for a few hours.

The most spectacular incident of the night hours was when P. F. Gillette, finished the second round in his Pullman, with a perfect score. All the lamps of the car had been extinguished and some helpers were filling the tanks with gasolene and oil. No one knows how it happened, but suddenly a sheet of flame burst from all sides of the car. Peter LaGreca, who was sitting in the car at the time was pulled from the fiery furnace, but not before he was badly burned. Gillette, who was superintending the filling, also was burned about the hands. The crowd fell back and not an instant too soon for there was an explosion which sent a

Digitized by Google

volume of fire toward the sidewalk. This was the end, for the fire had consumed all that was burnable about the car. Three minutes later the fire department arrived on the scene and extinguished what was left of the blaze. The accident was lamentable as Gillette had but recently started in business in Newark and the car was not insured, which means to him a loss of $2,000.

ONE OF THE CAUSES OF PENALIZATION

As the drivers arrived news of incidents on the course was brought in. Several of the contestants reported that an obvious attempt to wreck the cars had occurred at Denville during the night. A short distance beyond Fox Hill grade crossing, where the road winds in and out of the scrub land, some persons evidently placed long tree trunks across the road at intervals of two feet. These, averaging in thickness about four to six inches, were laid at a point in the road where there is a sharp turn and a deep gulley just beyond. J. A. Hopson, driving the Oldsmobile "Mud Lark," was the first to discover the obstruction. Hopson had lost considerable time on account of tire trouble and was way behind the other cars at Denville. At the point mentioned the searchlights revealed something in the road ahead and Hopson braked as quickly as possible, but not before the car had passed over the first piece of timber. Running slowly another log was encountered a few yards further on and then a whole mass of logs laid dovetail fashion across the road. When the car reached the Denville Hotel Hopson sent a telegram to the club house and a car full of officials went out and cleared the road. Other drivers reported that they had seen the obstruction in time to avoid accident.

After daylight the rounds were uneventful, but previous to that just the opposite was the case. The few hours between midnight and sunrise marked the fall of not a few cars from the perfect score position. In attempting to pass a hay wagon on a bad stretch of road between Mt. Freedom and Morristown, the Marmon driven by L. H. Roberts, got into a bog at the side of the roadway and stuck. Attempts to get the car out of the ooze were fruitless and finally the machine had to be pulled out by a pair of horses. It had a perfect score up to that time, but was withdrawn after the accident. Mrs. M. H. Rickey, in the other Marmon, was penalized 341 points when the car ran out of gasolene and the motor stopped perforce. Dr. J. Finley Bell, in the Hewitt runabout, experienced the same predicament. He had a perfect score for one lap until the tank went dry.

MRS. M. H. RICKEY, THE ONLY WOMAN CONTESTANT

I. M. Uppercue, in the four-cylinder Cadillac, came near having a serious accident, when he mistook the signals of some men with lanterns, and instead of taking the right angle turn near Somerville continued straight ahead; the car bumped into a high bank. One of the wheels was smashed, and the time required to get a new one caused the car to lose 1,098 points. The little single cylinder Cadillac entered by Uppercue and driven by I. D. Plank, covered itself with glory. It has been a figure in several endurance contests and was plugging bravely along in this until it bumped into a tree and the engine stopped long enough to entail a loss of three points. This was the only mark against it.

A brief summary will show what happened to the other cars that either did not finish or that were penalized. Hopson's Oldsmobile had clutch trouble on the first round and was penalized 12 points, while ignition troubles caused the withdrawal of Charles Fleming's Maxwell. The other two Maxwells, driven respectively by J. W. Mason and Dan Nichols, also did not finish. A babbit burned from the bearing of Mason's car on the first lap, due to lack of lubrication, and Nichols, after finishing four laps with a perfect score was compelled to quit because a leaky radiator developed. P, H. Johnson, Grout, had no points against him for two laps, and then lost 107 points for accidentally stopping the engine while repairing a chain. William Mazzaco's Mitchell lost 105 points through coil and other trouble. E. Cooley's and E. H. Cadmus's Mitchells were both withdrawn, the

Digitized by Google

former on account of the breaking of a truss rod and the latter because of engine trouble. Fisher's Autocar lost 76 points from a broken spark plug and minor troubles. The summary:

Car.	Driver.	Penalization Points.
*Matheson,	John B. Ryall	0
†Haynes,	R. G. Kelsey, J. Calhoun	0
*Oldsmobile,	Ralph Owen	0
*Locomobile,	R. A. Greene	0
†Ford Six,	A. T. Purcell	0
*Franklin,	F. C. Hinni, Jr., C. L. Edson	0
*Thomas,	Montague Roberts	0
*Cadillac,	I. S. Plank	3
*Oldsmobile,	J. A. Hopson	12
†Autocar,	C. E. Fisher	76
*Grout,	P. H. Johnston	107

A. A. U. Bars A. A. A. "Amateurs."

That the Amateur Athletic Union will not accept the American Automobile Association's "amateurs" who race for cash and against professionals was made clear at the annual meeting of the big athletic body in New York on Monday last, 18th. The subject was brought up on a point of information raised by the delegate from the Federation of American Motorcyclists, which is allied with both of the other organizations, and whose rather unusual position was explained. The short discussion that ensued was followed by the adoption of a resolution instructing the registration committees of the various A. A. U. districts to refuse registration as amateurs to all automobilists who may have raced for cash or against professionals. As the rules of the American Automobile Association make the occupation of the chauffeur in itself an act of professionalism, and yet permit "amateurs" to not only race for cash but against hired drivers, the A A. U. resolution reaches further and affects more men than appears on the surface.

Cobe Again Heads Chicago Club.

Election Day at the Chicago Automobile Club passed off quietly without any arrests being made for illegal voting. There was no opposition, one ticket only benig in the field. Ira M. Cobe, president, and F. H. Pietxch, first vice-president, were re-elected, and T. J. Hyman was elevated from treasurer to second vice-president. N. H. Van Sicklen succeeds Sidney Gorham as secretary, while Charles F. Gregory was chosen treasurer. The board of directors consists of John Farson, A. J. Banta, W. W. Shaw, Claude Seymour, T. N. Koehler and F. D. Countess.

MILE-A-MINUTE HILL-CLIMBING

Cedrino's Fast Time at Rhode Island Meet —Six Events Contested—Burst Steam Pipe Spoils a Finish.

Emmanuel Cedrino, driving a new 60 horsepower Fiat racing car, won the free-for-all class and established the fastest time of the day at the sixth annual hill climbing contest of the Rhode Island Automobile Club at Riverpoint, a short distance from Providence, R. I., last Saturday, 16th inst. Knight's Hill, a half mile incline averaging 13 per cent. grade, was the scene of action, and this Cedrino climbed in 30 seconds, just four seconds less than Blackington, his runner-up, required to make the ascent. Although Cedrino made the fastest time the most glory went to J. W. Grady, whose hill climbing propensities have asserted themselves in the past. In a stock Pope-Toledo Grady won two events and finished third in the free-for-all, and in the latter his time was only seevn seconds slower than that recorded for the Italian.

The day was ideal for the meet and the hill was in good condition. The one bad turn was banked so the cars, most of them, rushed it without cutting out power. The stone wall that follows the road on the right going up was crowded with spectators, and with several hundred persons stationed at the finish, besides fifty or more automobiles, the crowd was estimated at several thousand. There were twenty-three entries but the officials worked in harmony and with such precision that there were no vexatious delays.

Dutee W. Flint started the ball rolling by winning the class for gasolene cars costing $1,000 and less from H. B. Hunt in 49 seconds. Both drove Ford runabouts. Two Stanleys, driven respectively by Baldwin and Blackington, made the going in the touring car class for steam cars, Baldwin winning in 0:36⅕. These two men were the only contestants in the steam runabout class and Baldwin added another cup to his shelf by finishing in five seconds faster than in the previous event.

Three cars contested the class for gasolene cars under $3,000, a Pope-Hartford with Grady at the wheel, a Ford with Myers up, and a Pennsylvania which had Sweeney in the driver's seat. They finished in this order, Grady in 37⅗, Myers in 44⅘ and Sweeney in 55 seconds. In the $5,000 and under class, Grady was timed exactly the same as in the other event, to the fifth part of a second. John L. Snow, of Boston, in a Peerless, was the runner-up; his time was 42 seconds. In another Peerless of higher power Snow won the $5,000 and over, from Crafford, who manipulated a F. I. A. T. Their respective times were 39 and 45⅕ seconds.

What incidents there were happened in the last event on the card—the free-for-all. John Dower, in a Corbin, made the first trial and gave the crowd momentary cause for alarm when he skidded off the road, rubbed along the stone wall and then bounded off. The car suffered no damage and Dower finished in 38 seconds. Grady then essayed to better Dower's time and he did, by one second, but Blackington, who followed, clipped three seconds from Grady's figures. Baldwin in the other steam car did not finish. He had planned to cut a streak in the atmosphere that would put his name down in hill climb history, and in consequence had steam up to a bursting pressure. Baldwin got away like a rocket, negotiated the curves in a hair-raising manner and was on the final straight when the car was suddenly enveloped in steam and started to slide down hill. A pipe had burst and Baldwin and his car were shoved off the course. Cedrino was the last to start and because of this he knew just how fast to drive his car in order to win. He made a spectacular run, but shut his power off before the finish and coasted across the line. At that the watches gave him 30 seconds, the fastest time made at the meet, and which is at the rate of a mile a minute for uphill work. The summary follows:

Gasolene Cars Costing $1,000 and Less.

1 Dutee W. Flint, Ford 0:49
2 H. B. Rust, Ford 0:56⅕

Steam Touring Cars with Tonneau.

1 L. F. N. Baldwin, Stanley 0:36⅕
2 B. F. Blackington, Stanley 0:40

Gasolene Cars Costing $3,000 and Less.

1 J. W. Grady, Pope-Hartford 0:37⅗
2 Myers, Ford 0:44⅘
3 Sweeney, Pennsylvania 0:55

Gasolene Cars Costing $2,000 and Less.

1 Davis, Oldsmobile 0:49⅕
2 I. O. Pugh, Corbin 0:51⅗

Steam Runabouts.

1 L. F. N. Baldwin, Stanley 0:31⅗
2 B. F. Blackington, Stanlev 0:33

Gasolene Cars Costing $5,000 and Less.

1 J. W. Grady, Pope-Hartford 0:37⅗
2 John L. Snow, Peerless 0:42
3 Calvin D. Snow, Stevens-Duryea.. 0:47
4 Sweeney, Pennsylvania 0:50⅗

Gasolene Touring Cars Costing Over $5,000.

1 John L. Snow, Peerless 0:39
2 Crafford, F. I. A. T..... 0:45⅕
3 Congar, Stevens-Duryea 0:51

Free-for-All.

1 Emmanuel Cedrino, F. I. A. T.... 0:30
2 B. F. Blackington, Stanley 0.34
3 J. W Grady, Pope-Hartford 0:37
4 Dower, Corbin 0:38
5 L. F. N. Baldwin, Stanley ..... ——

It is of the utmost importance that the bolts holding together the parts of a live axle housing be drawn up to their full capacity at all times. Any slackness may permit a slight amount of play, which will alter the relation of the parts sufficiently to cause undue wear, besides rendering them liable to rupture.

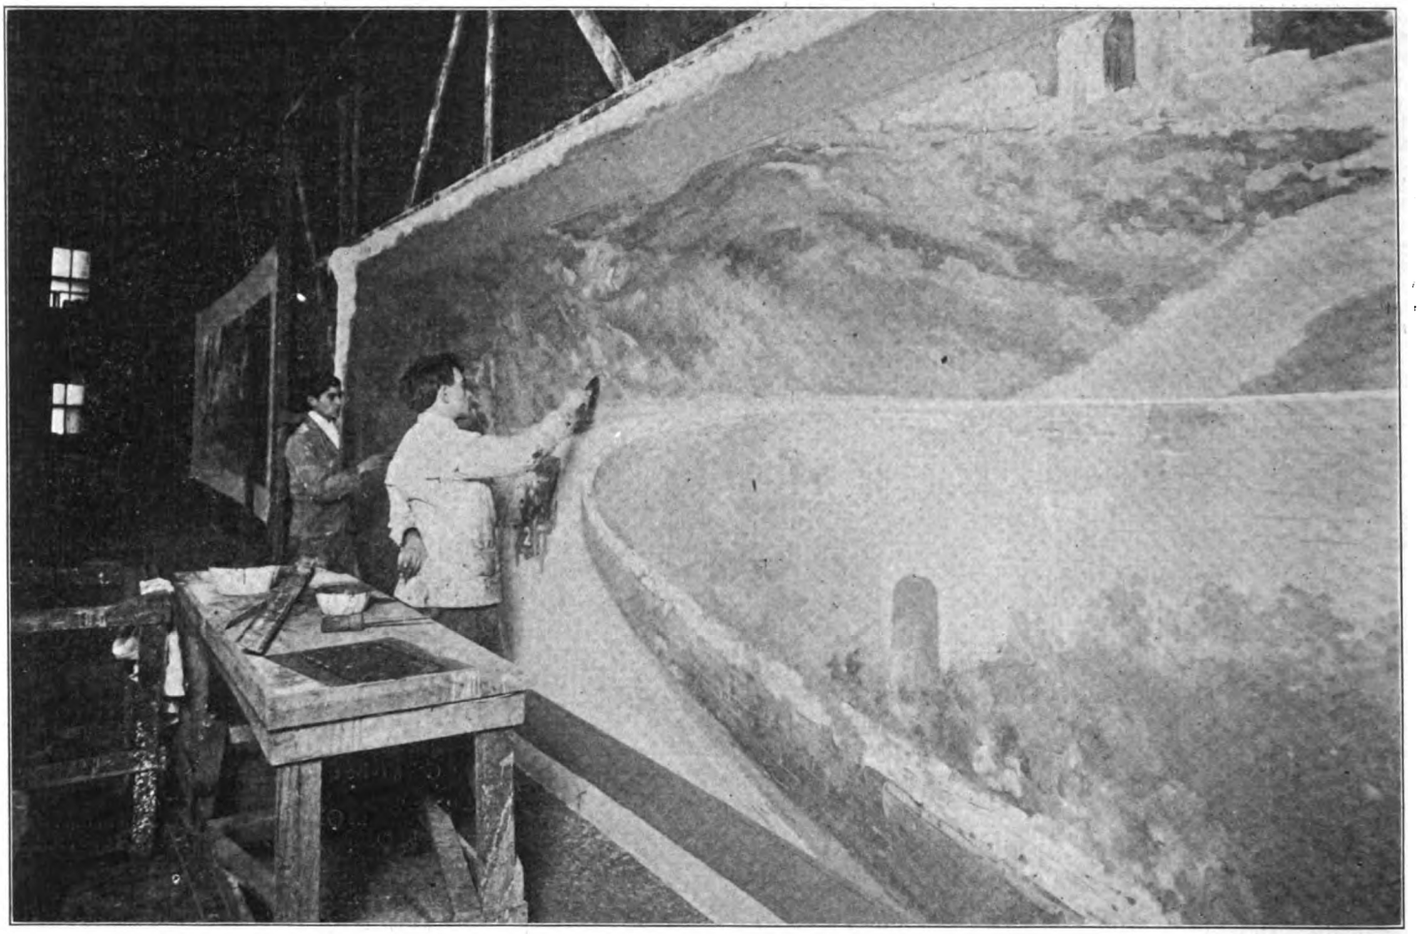
GETTING READY FOR CHICAGO SHOW

Decorative Work Completed—Figures Disclose Immensity of Exhibition—Ban on Sub-Leasing Withdrawn.

Although the Chicago show will not open its doors until November 30, the transformation of the Coliseum and armory buildings which are to house it has already begun, and the artistic brush is busy on the 8,704 square feet of canvas, comprising 142 oil paintings, which will make beautiful the setting of the exhibits. Around the gallery front for 668 feet, paintings 8 feet deep will depict motoring scenes, and 112 pictures will form a part of the background of the booths.

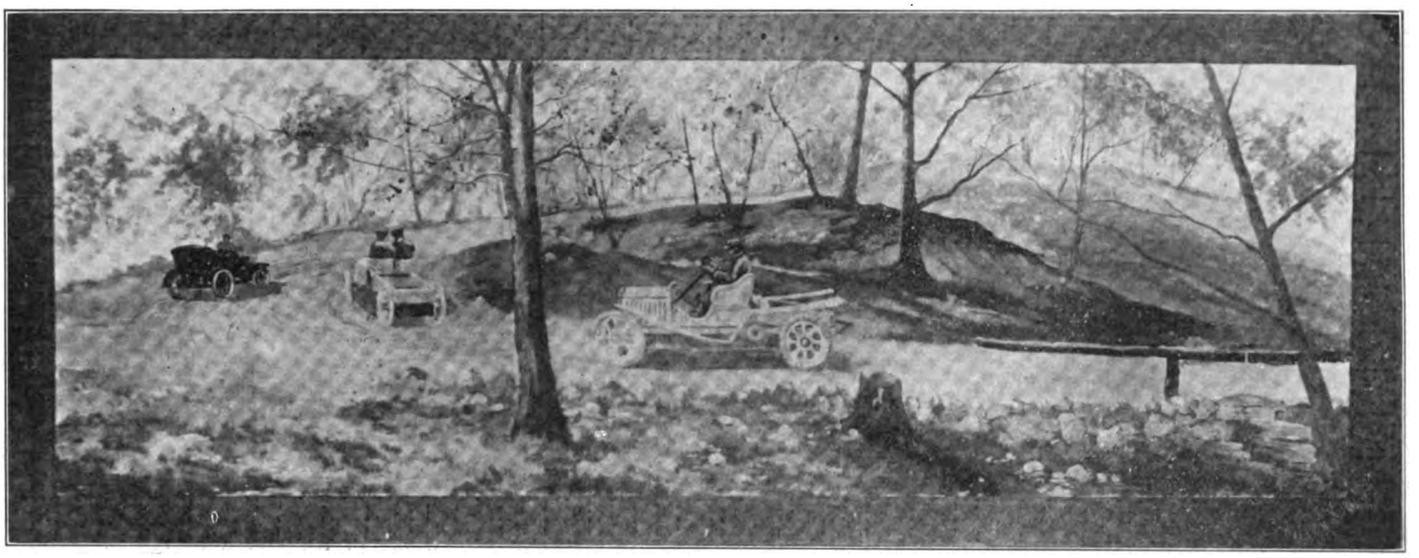
While the number and dimensions of the pictures are susceptible to numerical statement and square measure, respectively, in advance, their essence of art quality remains for judgment when they are disclosed but as their execution is in the main under the direction of Maratta, one of Chicago's foremost artists, the assurance is given that they will be of a very high order. Those who have had an advance peek into the studios are enthusiastic, so that the art gallery feature of the show may be expected to prove quite an attraction.



According to the figures of the management, the Chicago show will have more exhibitors of automobiles than the Palace and Garden exhibitions together, the latter two having a total of 110, while Chicago will have 117 exhibits on view. These with the motorcycle section and the accessories, will occupy a space of 110,000 square feet. While 180 concerns are officially scheduled for space in the accessory division, the number actually represented will be considerably greater by reason of the fact that the management has this year abandoned the objection to sub-letting that has heretofore prevailed. This departure is explained on the ground that "the management feels that it would be unfair to prohibit the admission of people for whom it is unable to provide, if they are able to find some kind friend who will take them in."

Heretofore the prohibition against subletting space has been very stringent at all of the big shows because of the speculative efforts of some enterprising persons to get an allotment of as large a space as possible to later farm it out to less fortunate applicants at a profit. The experiment of removing to some extent the ban against it will in its results influence other show managements in the futude.

The great press of applications for space made it necessary this year to add greatly to what was used last year, and these additions alone are said to equal 75 per cent. of the entire space available at the Palace and Garden shows in New York. Exhibitors will be tucked into every possible nook and corner, yet the indications are that there will still be a large disappointed waiting list.



Not the least significant and interesting demonstration of automobile bigness in connection with the Chicago Show is the shipment of show cars from the Madison Square Garden that is now making its way westward to the Windy City exhibition in two long train loads, each train consisting of thirty freight cars and each car containing from two to four automobiles. This is said to be the largest automobile shipment ever made, and, in fact, the largest shipment of any one manufactured product to be transported at one time over one railroad route.

All of the arrangements for loading and forwarding the machines were made by the traffic department of the Association of Licensed Automobile Manufacturers, and the facilities which were offered made it possible to load the entire lot of automobiles in six hours after the close of the Madison Square Garden show, without a single case of damage. Upon arriving at Chicago the two trains will be switched to different

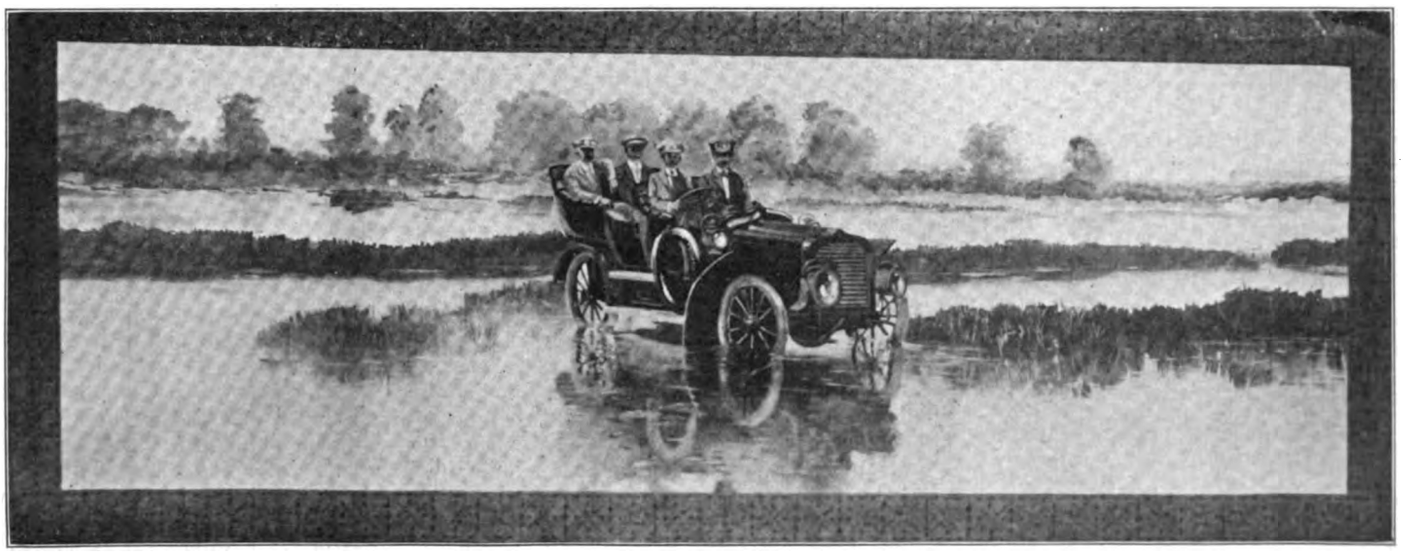
ARTISTS PREPARING DECORATIVE SCENES FOR THE CHICAGO SHOW

Digitized by Google

ONE OF MARATTA'S SYMBOLIC PANELS AT THE CHICAGO SHOW

points with a view to avoiding congestion and minimizing the possibility of damage through overcrowding, thus facilitating the work of unloading. In the past it has been difficult for automobile manufacturers to get suitable cars in which to ship their machines, the ordinary box cars offered by the railroad being fitted with small, inconvenient side doors. For the shipment of cars to Chicago, the traffic department secured special wide-door cars so arranged inside that the machines could be well packed and secured against slipping or bumping.

Baltimore Show Opens Tamely.



Opening night at Baltimore's third annual show, Saturday, 16th inst., was robbed of some of its interest by the same cause that made the Philadelphia exhibition not quite as auspicious as it might have been. The Philadelphia show overlapped the New York show and the Baltimore affair trod on the heels of the Quaker City display, opening on the night the Philadelphia show came to an end. As a result many of the exhibits were not in place when the doors of the hall opened.

Baltimore has no public exhibition hall large enough for the purpose so the show is staged in the garage of the Motorcar company, at Maryland and Mount Royal avenues. The garage was profusely decorated with bunting and flags.

One of the prominent cars missing is the Matheson. There was insufficient room at the garage exhibition hall, so Palmer & Singer, New York agents for the car, are holding an exhibition of their own in the Hotel Belvedere, in the tea room to be exact. Among the exhibitors showing cars are the following: Baltimore Motor Carriage Co., Winton. Callahan,Atkinson & Co., Locomobile. Hamilton Auto Co., Stoddard-Dayton. Lambert Automobile Co., Maxwell. Shaffer Mfg. Co., Pullman. Snowdeal Auto Co., Marmon. French & McCormick, Oldsmobile. J. L. B. Wilhide, Atlas and Kisselkar. Mar-Del Co., Franklin, Packard, Elmore, Buick and Pope-Waverly. Motor Car Co., Peerless. Mount Vernon Motor Co., Autocar. Maryland Motor Car Co., Maryland. White Agency, White steam cars. Southern Automobile Co., Pierce Arrow. Auto Storage & Supply Co., National and Lambert. W. D. Gill, Royal Tourist.

Where Owner's Liability Ceases.

That an owner of an automobile cannot be held liable for damages caused by his car when it is in charge of a chauffeur without the owner's permission is the decision of the State Superior Court in reversing a decision of the Philadelphia Common Pleas Court. The case was decided on the appeal of an owner of a car which killed a child while being driven by an employee who had taken several of his friends for a ride in opposition to the wishes of the owner.

ANOTHER OF MARATTA'S CREATIONS OF THE AUTOMOBILE IN ART

CONVERTIBLE QUALITY OF ENERGY

How It Appears in the Operation of the Automobile—Effect of Temperature Range on Efficiency.

Energy is a term which is constantly coming up in discussions regarding any sort of mechanism, and one which is more or less apt to be misunderstood because of its close relationship to motion and power, which, in a way, may be termed its visible manifestations. The distinction is apparently a fine one, speaking from the non-technical point of view. Nevertheless, it is important to bear it in mind continually in order to appreciate the theory of action of any mechanical device in a thoroughly clear and intelligent manner. On this account, the following elementary presentation of the distinguishment between energy and the primary forces of heat and motion, is valuable because of its simplicity and pointedness. The writer, a foreign expert, also lets fall some light on the much vexed question of the efficiency of the gas engine.

"The word energy is one which is constantly in use, and is most commonly used in connection with some mechanical appliances," he remarks. "Thus if one sees a revolving flywheel, a conception of the energy stored in it is entertained by the difficulty which would be experienced in stopping the wheel. This, in fact, forms a true conception of the energy stored in the wheel, for the work done in this way is a measure of the stored energy. This, however, is only one form of energy; there are, of course, others, such as chemical, thermal, electrical, etc., and the amount of energy stored in any one of these forms can be expressed in terms of any one of the others.

"An example of heat energy being stored chemically is found in ordinary lime, for if water be added to it and the lime be slaked a considerable amount of heat is evolved. This heat was stored in the lime and water in some particular molecular form as chemical energy, and by converting the lime into slaked lime the amount of heat equivalent to the amount of chemically stored energy was liberated. If now we can conceive the slaked lime being converted back into lime and water again heat would have to be taken in by the lime in order to store up the necessary chemical energy. This essential heat for the process would be taken from the containing vessel, and thus leave it (the vessel) and the surrounding objects at a lower temperature.

* * * * *

"During the formation of petrol from its elements heat must be absorbed, and is stored up in the petrol as chemical energy, for in converting one gallon of petrol with a suitable quantity of air into so much soot and waste gases by burning it sufficient heat is given out to raise 140 gallons of water at 60 degrees Fahr. to boiling point.

"Suppose two equal quantities of petrol be taken and one portion be burnt in a suitable burner, and all the heat so evolved be measured. Suppose also the other equal portion be utilized in driving a petrol motor under load, and all the heat proceeding from the motor be carefully measured. Then it would be, and has been, noticed that more heat is obtained from the burner than from the motor. The reason for this is that upon the instantaneous ignition of the fuel in each case exactly the same amount of heat is evolved; but in the case of the motor some heat entirely disappears, being converted into work, this being an instance of the convertibility of the different forms of energy referred to previously.

"A very good idea of the amount of heat equivalent to a certain amount of mechanical work done is obtained by rubbing together, say, two flat pieces of wood. The heat so evolved is an exact equivalent of the work done by rubbing. It must be borne in mind that the work done by rubbing and the heat so evolved are convertible. That is to say that if an amount of heat equal to that generated by friction were given, then it would be possible with a perfect heat engine to do just the same amount of work as was done in the first place by rubbing.

"If it be considered how much work would have to be done by rubbing two surfaces together to produce as much heat as proceeds from the exhaust of, and by radiation from, a petrol motor an idea is gained as to how much more mechanical work a motor would do if absolutely thermally perfect. In such an engine the exhaust gases, having been robbed of all their heat energy and converted into work, would be cold, and the fuel consumption per unit of work would be correspondingly decreased. Such considerations are embraced in the science of thermodynamics, and it can be shown that the possible thermal efficiency increases as the difference in temperature of the explosion and the exhaust gases increases. It should be remembered, however, that the thermal efficiency would not be increased by cooling the exhaust gases with a water jacket. The difference in temperature referred to must be produced by the expansion of the gases, and the only way in which the temperature of the exhaust gases may be decreased with a view of increasing the thermal efficiency is by allowing the gases to expand further while pushing the piston.

"From this it is seen that the higher the temperature of the explosion (while the temperature of the exhaust gases remains constant) the greater is the possible thermal efficiency, which is limited by mechanical and chemical properties of the engine parts and lubricants.

"Now, in the case of a car, that heat which is converted into work pushes the piston along, which motion is eventually used to turn the wheels of the car, and it is interesting to enquire what becomes of all this mechanical work, which is given to the piston. First of all, a certain quantity of the mechanical work is required to overcome the friction of the moving parts of the mechanism of the car, and this so used work is once more directly converted into heat. The work transmitted to the driving wheels which propels the car (along a level road) is also entirely used in overcoming the frictional resistances of the road and air, and consequently this work must also be converted into heat. Thus it is seen that the heat abstracted and stored up during the natural formation of petrol at some remote period is reproduced by the running of a motor, and is used in heating the earth and the air, either by friction or conduction from the hot exhaust gases. It should be further noted that the conversion of the whole of the stored energy in petrol into heat, when running a car, does not depend upon the thermal inefficiency of the petrol motor. If the motor had a thermal efficiency of 100 per cent., and the exhaust gases were cold, the stored up energy in the petrol would still be reproduced as heat, because the whole of the work done by an engine in driving a car (along a level road) is dissipated in overcoming frictional resistance, giving rise to an equivalent amount of heat."

New Form of Spring Shackle Finds Favor.

One of the little detailed alterations which is observable on a number of cars this year, and which, though of small apparent value, yet may be at times of considerable importance, is the use of the new form of spring shackle which in addition to the two bosses and side pieces necessary to its action, carries also a bar connecting the two sides, and so placed as to prevent the member from being reversed, thus permitting the spring to come into a position below instead of above the dumb iron. In the past, considerable trouble has frequently been experienced owing to the tendency of weakened springs to reverse their shackles in this way, This condition naturally tending to warp the frame slightly, threw several sorts of unnatural stress upon it and was apt to strain it, in addition to forboding the breaking of the shackle if not the spring itself, if not quickly observed and pried over into its proper position.

To Prevent Bonnet from Rattling.

When a two-piece bonnet of the Continental type gives offense by rattling continuously and persistently, a simple method of checking the sound and a large part of the motion which causes it as well, is to place a stout leather thong or belt lace between it and its supporting flanges on radiator and dash. To this end the flanges may be drilled at regular intervals with small holes, not large enough to weaken the metal, while the thong is simply laced through them, alternately over and under, the ends being firmly secured.

TEST OF THE SIX CYCLE ENGINE

Two Extra Strokes Designed for Scavenging Purposes Appear Worth While—The Results Deduced.

It is well known that many of the shortcomings of the common type of four-cycle motor are due to the dilution of unburnt gases with a portion of residue left over from the previous explosion. Some effectual method of scavenging the cylinder, has been sought on this account, but without avail up to the present time, because all such efforts, however successful, thermally speaking, have involved more or less mechanical complexity which the increased economy has not been sufficient to repay. In connection with these attempts, the proposition of employing an extension of the Otto cycle in the form of a six stroke cycle, the two extra strokes serving merely to induct and expel pure air, has been broached more than once. It has become well known that such a system would result in increased economy of performance in several ways. but broad and general data on the subject, and covering the results of authentic tests, has been lacking, although such tests are known to have been carried out more or less completely.

On this account the results of certain experiments conducted at the University of Birmingham (England) by Professor Burstall, and covering the performance of an engine of the "six-cycle type," recently designed by Arthur Rollaston, are particularly interesting. Briefly speaking, this motor, which is practically identical with the ordinary four-cycle motor except for the addition of a scavenging valve, developed about the same ratio of power to weight as the ordinary type of motor, notwithstanding its slightly heavier construction, and showed on certain tests, as much as one third increase in power over what would be expected from its bore, according to the Automobile Club formula, which is the same as that employed by the Association of Licensed Automobile Manufacturers, in this country. In efficiency, it developed a very decided improvement over the ordinary type of automobile motor.

The motor under test, which measured 5 by 5¼ inches, bore and stroke, and was of three-cylinder construction, had its inlet valve, placed in the center of the head, the exhaust being located in a pocket at one side, and working from a direct cam lifter in the ordinary way. The scavenging valve, was placed directly over the exhaust valve, and in the position frequently used for the inlet of the ordinary motor.

Theoretically, the air in the valve chamber does not mix with the explosive charge in the cylinder when it is first admitted. Consequently, at the beginning of the explosion, the air contents absorb a certain amount of heat from the main body of the charge, which they later give out. In this way, it is claimed, the maximum pressure of the explosion is reduced, while the mean pressure throughout the stroke is increased. By the same token, the mean temperature of the explosion stroke is reduced to a certain extent, while the maximum temperature is considerably lowered. Still another point which is of considerable value to the motor from the mechanical standpoint, is that the scavenging charge, being taken in directly over the exhaust valve, cools that member very effectually, thus prolonging its life. The cycle is precisely that of the Otto engine except that at the end of the exhaust stroke a charge of pure air is inducted through the scavenging valve, and again expelled on the succeeding stroke through the exhaust, the cylinder being thoroughly cooled and washed clear of the residue of the former explosion before the new charge is inducted.

The advantages claimed for the arrangement are: First, the certainty of absolute and complete combustion of the charge, whether it be up to full cylinder capacity, or closely throttled. This is not possible of attainment with the ordinary type of motor for the reason that as the charge is throttled, the ratio between the live gas of the new charge and the dead residue left over from the last explosion, is increased, the increase of this "coefficient of dilution" rendering combustion less and less perfect as the quantity of the fresh charge is diminished, even though its quality be weakened proportionately. Second, the extra strokes serve the purpose of cooling the cylinder to such a degree that it is claimed no overheating can take place with a motor of ordinary design, even though run at full load for a great length of time. Backfiring also is prevented, because of the low cylinder temperature encountered by the incoming charge, as a result of which, also it is possible to run the compression pressure to a much higher point than is possible ordinarily and without risk of preignition. Third, by the insurance of complete combustion under all conditions, the exhaust is clarified to such a degree that it is rendered practically odorless and innocuous, a point which under certain circumstances, is of considerable value.

Indicator diagrams taken during the test show clearly that the cycle obtained is an improvement over that of the ordinary motor. The typical card shows a mean effective pressure of 75 pounds, and an indicated horsepower of 17.1 at 800 revolutions per minute, the brake horsepower at this rate being no less than 14.1. The tests were carried out at speeds ranging from 450 to 1,080 revolutions per minute, the runs being of long duration in every case.

"At full load at speeds varying from 300 to 1,000 revolutions per minute, the consumption of petrol was 0.54 lb. per i. h. p. hour and 0.66 lb. per b. h. p. hour The thermal efficiency of the engine per i. h. p. was 25 per cent., while the heat to water jacket was 30.7 per cent., and to exhaust 44.3 per cent." says the Autocar, in reference to the tests. "The analysis of the exhaust gases gave carbon-dioxide 6.3 per cent., oxygen 8.7 per cent., and the exhaust contained no carbon-monoxide or hydrogen, and was also clear and odorless.

"The compression of the engine was 75 pounds per square inch, and the mean pressure shown on the indicator cards was 90 pounds per square inch. The mechanical efficiency was 82.5 per cent., which must be considered a very good performance for a six-stroke engine. At all speeds and powers during the trials, the engine worked without overheating or any other trouble, and with an exhaust without the least suspicion of color or smell. When using hydro-carbon fuels, the six-stroke engine is found to be practically equal in power to a four-stroke engine at the same speed. This is due to the replacing of the hot products in the clearance by comparatively cold air, and to the cooling down of the cylinder, which allows of a greater weight of the combustible gas being taken in, this being approximately 33 per cent. more per charge than usual. This large charge of combustible gas can be burnt completely, owing to the products of combustion being replaced by air.

"Owing to the cooling action of the scavenging air on the walls, piston, and valves, to the time between the explosions being increased, and to the lower temperature of the explosions, the temperature of the cylinder walls, pistons, and valves is considerably lower than in non-scavenging engines. As a consequence the lubricating oil does not become burnt and form deposits of carbon on the piston, valves, and sparking plugs. A less quantity of lubricating oil is required in working. The lower temperatures of the scavenging engine preventing deposits of carbonized oil in the cylinder, combined with the low temperature of combustion and the absence of shocks and strains to the engine parts, enable these engines to run for long periods without cleaning or attention, and with little wear of the working parts."

Further results of the trials are given in the following table:

	Referred to brake h. p.	Referred to indicated h. p.
Petrol, per b.h.p.....	0.66 lb.	0.54 lb.
Revolutions per minute	717	
Thermal efficiency on brake	20.5%	25%
Percentage of heat of fuel rejected to jacket water	37.2%	30%
Heat to exhaust	42.3%	45%
Composition of exhaust gases—		
Carbon-dioxide	6.3%	
Oxygen	8.7%	

An interesting comparison with these results is furnished by the results of tests carried out on a four-cylinder automobile motor of standard construction early in the year, by Professor Hopkinson, of Cam-

Digitized by Google

bridge University, in which the best results obtained at 1,000 revolutions per minute, gave for consumption referred to brake horsepower, 0.75 pounds, and referred to indicated horsepower, 0.60 pounds. The thermal efficiency referred to brake horsepower was, in this instance, 19.3 per cent., and referred to indicated horsepower, 24.2 per cent. The motor in question was a veritcal machine of the four-cylinder pattern, with 3½ by 5⅓-inch cylinders, and developed a maximum horsepower of 17½ at 1,000 turns of its shaft.

Guard for the Bar Sprag.

While the simple type of bar sprag is not perfectly well adapted to the purposes of ordinary touring car, still because of the simplicity of its application to existing machines, as well as its low first cost, there are times when it is preferable to any other style. In commercial vehicles, of course, it is always to be preferred to any devices which are applied to the sprockets or driving gear because it is not dependent on the condition of any other portion of the mechanism, such as the chains and sprockets. Wherever it is employed, however, and particularly in connection with heavy vehicles, it should be guarded by means of a stout chain linking it to the chassis in such a way that it cannot be reversed in case it finds a footing in soft earth. The chain should be of sufficient length to permit the sprag to bite into the roadway two or three inches, or up to the collar which usually surrounds the toe, but no further, and it should be independent of the chain or cable by which it is to be drawn up when out of use.

Care of Selective Gears.

In cars employing the selective method of gear changing, it is very essential that the telescoping shafts of the brake and gear mechanisms be kept clean and well lubricated at all times. The gear rocker shaft in particular, on account of its rotative and longitudinal motions, tends to accumulate sand and dust from the road, and transfer it gradually through the entire length of the shaft, and into the gear box, if that enclosure happens to be in direct communication with it. On this account the external portion of the shaft should be kept as free from oil as possible and carefully cleaned whenever the machine has been exposed to muddy roads. Lubrication should be provided only through the regular oilers, but at frequent intervals, care being taken not to use an excess of oil in any case.

To Keep Metal Steps from Rusting.

Metal steps and running boards, if wiped off with a rag dipped in kerosene whenever the car is washed, are not likely to rust, and always look tidy and neat. Further than this, it is well to touch up the worn treads with asphaltum paint occasionally, in order to protect the metal and prevent it from looking old and worn.

MOTORCYCLISTS WHO COME HIGH

Being a Story with an Obvious Moral, Which Led to the Police Court and a $25 Fine.

Even the victim of the joke laughs at it, and it is a good one, at the expense of a well known business man in Newark, N. J., who owns and drives a high powered automobile. He was driving along Central avenue a few days ago with another young man as his companion. Keeping well within the speed limit they were overtaken by a man and a woman on a motorcycle "built for two." The latter passed them, dropped back, and then circled them. Nothing was said, but the motorcyclists seemed to be enjoying immensely the fact that the big machine dared not let out its speed and that their little one could run all about it and chug-chug with delight, besides sending out an occasional snort of disdain or defiance.

For a few minutes the automobilists stood the teasing, but then the man at the wheel bristled up, pulled a lever sharply and let out a few notches of speed and in less time than is consumed in telling the story sent his powerful machine away from the little motorcycle, leaving the latter a couple of blocks behind. Believing himself rid of the annoyance, the automobilist slowed down. A block further on he passed and saluted a motorcycle cop who was resting at the curb.

The cop mounted his machine after the automobile had passed, and started along in the same direction. Hearing the motorcycle the automobilist remarked to his friend, "Here come that man and woman again to have fun with us, but I'll fool them." Then he opened up again and went ahead at a 20-mile clip. Instead of losing the motorcycle, however, the little machine seemed to be gaining, and the speed of the automobile was increased.

It was at this point that the friend looked back, the first time that either occupant of the automobile had thought of so doing. "Pull her down! It's a cop!" he yelled. But the man at the wheel didn't understand and kept up the high speed. "Stop; it's a cop!" his friend excitedly shouted in his ear. He didn't understand even then, but he looked around to see what the trouble was and saw the motorcycle policeman, who was then abreast of his machine. In an instant he slowed down and stopped. An explanation was made, but the policeman courteously insisted upon making an arrest. When the police station was reached the story was told again and all hands enjoyed a good laugh, but the automobilist had to put up $100 for his future appearance. Later the story of how the automobilist unwittingly raced with a policeman was repeated before Judge Herr, but there was no denial of the speed law having been violated, and the magistrate imposed a fine of $25.

"Those motorcycles, when driven by any one who likes to show his contempt for an automobile and to impress upon automobilists that the little snorters can go as fast as the big machines, and who do not hesitate to do it in an offensive way, are a great annoyance," said the automobilist later. "They will goad almost any man with red blood in his veins into taking a chance by letting out a few speed notches in order to get away, but the next time I do it I'll make sure that the motorcyclist is not a cop. The one who arrested me is a good fellow and did only his duty under the circumstances. He was as much astonished at my trying to run away from him as I was at his chasing me. There was no reason for me to attempt to race away from him, because we had just spoken to each other, and I knew that was not the time or place to put on speed. I did it merely to get away from the man and woman whom I believed were coming up behind again to have fun with me."

Fuldner Re-elected by Milwaukee Club.

Dr. Louis Fuldner was re-elected president of the Milwaukee Automobile Club at the annual meeting last week. Other officers chosen were: First vice-president, Emil Schandlein; second vice-president, J. C. Baird; secretary-treasurer, James T. Drought. The annual report showed a membership of 200, and a cash balance in the treasury of $500. During the past year the club paid out over $3,000 for good roads and in working for favorable legislation.

Automobiles for Detective Service.

Automobile service for fire or burglary dispatch is the latest innovation of a Milwaukee detective agency, who have just purchased three Rambler automobiles, to be placed at the disposition of patrons in cases of fire, burglary, or to attend to unlocked vaults. The service will be in force between 6 p. m. and 6 a. m. and will be free to subscribers. Automobiles also will be provided to convey patrons to night or early morning trains or for doctor calls.

St. Paul Club Elects Officers.

At the annual meeting of the St. Paul (Minn.) Automobile Club the following officers were elected for the ensuing year: President, Reuben Warner; vice-president, R. M. Neely; secretary, H. S. Johnsona; treasurer, W. O. Washburn; directors, Oscar L. Taylor, F. B. Lynch, T. W. Ingersoll, and W. R. Edwards The club has a little more than $2,000 in the treasury and the membership numbers 140.

A two-mile automobile track is to be built at Venice, a Los Angeles (Cal.) resort. A club house and garage also are planned and the promoters expect to hold meets as often as advisable. The course will be ready for use about January 25th, it is stated.

MANY STRANGE CAUSES OF FIRE

Elements that Contribute to the Expense of Insurance—How Risks Might be Lessened and Premiums Lowered.

Automobile manufacturers and garage proprietors are not alone in feeling the burden of high fire insurance rates, as the carriage industry has much the same thing to contend with, but the carriage manufacturers are giving the question of insurance rates some close study and their investigations both into the fiscal side and into the causes for fires are of direct concern to the automobile trade because of the similarity of the risks. Seemingly strange are some of the causes for conflagrations according to the report of the insurance committee of the Carriage Builders' National Association, and yet many of these causes are said to be much more common than is generally supposed. The committee has been charged with the duty of giving the matter of fire risks and rates careful investigation and rendered its report to the carriage builders at their last annual convention, recently held in New York. In discussing fire causes and the question of insurance rates, the report has the following to say:

"When we realize that on an average over $160,000,000 is destroyed by fire in the United States every year, we will see we are facing one of the most important questions that can come before us. It makes us realize that it is necessary to investigate the causes of fire and to seek to reduce the fire loss as far as possible.

"Sixty per cent. of all the fires that occur start from preventible causes. Part of this loss is caused by ignorance, and an education along the line of fire prevention will help. A great part of this loss is caused by rank carelessness, and the results of such carelessness should be published in such a way that the careless individuals will be more careful.

"Even when we are most positive in our own minds that we have our property in such shape that no fire can possibly start, we would do well to stop to realize some of the hundreds of ways in which a fire might start outside of human agency—to say nothing of the danger from personal enemies, or those people who, without any animosity whatever, have been known to set fire to buildings simply for the purpose of seeing the excitement. We had the latter case illustrated at Indianapolis within the last eighteen months in the plant of E. C. Atkins Co., one of the largest saw manufacturers in the world. Two small boys set fire to some material in the department in which they were working, and while the blaze was extinguished without much loss, the boys repeated the act on three different occasions before they were discovered.

"But leaving human agency aside, it would be very profitable to glance at some causes from which fires originate: Cotton waste or other material for spontaneous combustion thrown into a corner; ashes recklessly knocked from a pipe or cigar; the stump of a burnt match thrown into combustible material; an overheated stove; a neglected furnace room; matches left for rats or mice to drag between the floor and ceiling; old clothes — especially painters' clothes — thrown down into a pile on the floor, or left near a stove; a watchman's broken lantern, or any one of many other causes too numerous to enumerate.

"Lightning causes much more loss in the country than it does in the cities. Brick platforms under forges, or stoves, are not safe, unless the wooden floor beneath is protected with zinc because live coals sometimes sift down between the bricks.

"Most men are careless of the necessity of keeping matches in tin or stone jars to prevent being ignited by rats, mice or even cockroaches. A most remarkable incident is given by an agent at Jacksonville, Fla., who made the report that while his family was absent from the city he went to his house at noon, and when he was in one of the rooms he heard a noise behind him, and turning, saw a box of matches which had been ignited by the gnawing of a cockroach—one of the largest he had ever seen —which, frightened by the fire, was running down the leg of the table on which the box of matches stood. Here is an instance, capable of proof by an intelligent man, of a danger at which most people would laugh as being improbable.

"The Journal of Commerce and Commercial Bulletin, New York, gives the following clipping: 'A great deal has been said about mice starting fires, but it is seldom that positive proof of the assertion can be found. This week Fred Wedigen, a Williamsport, Pa., agent, received from a grocer a box which showed just how such fires are started. In this instance, one-half of the matches were gone and the remains were used in building a nest for the mice. Two young mice, probably as many days old, were found in the nest. The mice gnawed the wood of the match until it resembled excelsior. All but the heads of the matches were used. The heads were carefully piled away in one corner of the box under the nest. It is when the mouse gnaws too close to the head that fire is started. Instantly one is ignited the shavings in the box blaze up, and sometimes serious conflagrations result.' We would most heartily recommend the use of safety matches as a means of preventing loss from this source.

"Working over hours causes many fires, through the sleepy indifference of tired workmen, especially where the overtime work is only for a few hours, as, in the hurry to get home, they are liable to leave without taking proper precautions to see that there are no hot journals, etc. It is a grave question whether all-night work is not less hazardous than half-night work. Where employees work half the night to make up time, and go home tired out, they too frequently fail to examine journals and put out smouldering fires, which blaze up after they leave, when there is no one to extinguish them.

"Oily waste is often the cause of fire in shops running machinery where it is used to wipe off the machines, and afterwards carelessly thrown aside in some closet or rubbish heap.

"It will be understood also, that heat results from almost every operation of force —the friction of machinery, the turning of iron in a lathe, the cutting of threads on a bolt, the driving of a nail into wood, and especially into hardwood, the electricity generated by a rapidly moving belt, and a hundred or more operations that are familiar to mechanics.

"Long and costly experience has taught the fire insurance inspector to be on the constant look-out for untidiness in a risk —carelessness as to rubbish, waste, ashes, and other accumulations which are dangerous. It is safe to assume that there is no such thing as 'clean waste,' and that all accumulations of rubbish are objectionable, because they almost invariably contain self-igniting substances, or become the resting places for cast away cigarettes, cigars or half-burnt matches. The insurance inspectors work on the basis that it is always best to decline a 'dirty risk.'

"The best receptacles for waste are large iron cans or legs lifting them from the floor, and with hinged metal covers, whose contents might burn out without igniting the premises, and they should be emptied each night, their contents being burned under the boilers before closing hours, or removed from the premises to a safe distance.

"It is in the majority of cases a most profitable investment to have a well-constructed building made of brick, with fire doors, fire walls, elevator shafts cut off from the main building, lighted by electricity, and heated by steam. But, above all, as a rate saver, the automatic sprinkler is certainly the best. While automatic sprinklers are very expensive in the initial cost, yet after being installed they make a saving, not simply for the time being, but on the premiums paid year after year, and are a most profitable investment.

"The average business man would not think of making an ordinary contract without first reading the terms of the contract, and yet when he takes out fire insurance on thousands of dollars worth of property, he is just as apt as not to take the policy (which is the contract) and put it away without even looking at the terms of it. It is well to know that, if property stands on leased ground, this must be stated in the policy, or the insurance will be void. A personal friend of the writer's lost almost all of the money he had just from this one point. It is necessary to inform the insurance company, if there is any other insur-

Digitized by Google

ance on the property, or if mechanics are employed in altering the building for more than fifteen days at any one time, or if any change takes place in the title to the property, or if the property becomes vacant. The company will not be liable on account of neglect of the insured to use all reasonable means to save and preserve the property at and after a fire, or when the property is in danger of fire, nor by explosion of any kind unless fire ensues, and then for the damage of fire only.

"The past year has seen a continued increase in the number and in the strength of the mutual fire insurance companies, especially those that carry factory risks. When we realize that it costs the 'Old Line' companies as high as 50 per cent. of the premium simply to get the business and put it on the books, and without any account being taken of the loss expense, it becomes evident that there is a large field for a mutual campany which has no agents at all, and which has no high-salaried officers. The stock company is organized primarily to make money for its stockholders, while the mutual company is organized primarily to make money for its policy holders.

"As the stock companies have formed rate associations all over the country, there is no competition between them, and consequently there is no hope for any cheaper rates from them. The mutual companies are the only sources of relief that the insured has, and for that reason they have been filling a most important place in the fire insurance world.

His Dictionary Didn't Save Him.

Neither the oratory of his eloquent counsel, his dictionaries and other exhibits in the case, nor the extreme delicacy of the novel contention raised, saved Edward F. Davenport, of Cambridge, from being fined $10 by Judge Kelley in the Hingham (Mass.) court, on the charge of overspeeding at "the intersection of public ways," as the complaint put it. Some time ago Davenport was haled into court on the dual charge of rounding a curve too fast and also for overspeeding at the intersection of East Kilby and Summer streets. He was acquitted on the "curve" allegation, and because of the technicalities raised relative to the other complaint the hearing of that phase was postponed. Although dictionaries, geometries and other text books were produced and an argument lasting several hours resulted over the word "intersection," the judge found the motorist guilty. Davenport promptly took an appeal against this judgment.

An Owl to Do His Honking.

Stephen Cass has just brought the first motor car into Haskell county, Kansas. That fact is not startling, but the Kansas City Star states that Cass has a trained screech owl that he will perch on the dash and use instead of the "usual honk-horn." Accessory manufacturers take notice.

PROGRESS TYPIFIED IN PARADE

Horses as Guests on Big Electric Trucks—Their Drays Dragged Along as Idle Trailers.

As a bit of picturesque symbolism relating to the horse and the self-propelled vehicle, three big electric trucks, made by the Studebaker Co., paraded down Broadway, one afternoon last week, from Forty-eighth street to the Battery, giving New Yorkers something of a shock by carrying great truck horses as their load and hauling in the rear the drays such as the horses pull. Just why big, healthy draught horses should be toted around in automobiles in the manner shown by the accompanying illustration was something of a puzzler for the crowds at first, until the point dawned on them and then there was many an appreciative grin. The horses themselves did not relish the joke and one of them registered his protest against so public an intimation of his passing usefulness by kicking the side pieces off the automobile that was carrying him. At the conclusion of their parade the electrics were delivered to the H. B. Claflin Co., making a total of six now in use by that concern. Each vehicle weighs 8,400 pounds and has a capacity of three and one-half tons, with a maximum speed of seven miles per hour.

CELEBRATING THE VICTORY OVER THE HORSE

Swiss Antipathy to Automobiles.

The Canton of the Grisons is the only part of Switzerland where automobiles are under an official ban, according to a foreign correspondent of the Sun. The Federal Council, it is true, resolved a while ago, he states, to open certain roads through the canton to automobile traffic, but public opinion took a determined stand against this decision. Thousands of signatures were collected to a hostile manifesto demanding a referendum on the matter, with the result that the Federal Council's proposal has been upset by 10,000 votes against 2,000 who declared in favor of admitting motor cars on certain specified routes.

Apart from this local instance of open public hostility against automobiles there can be no doubt, judging by the personal experiences of many American motorists during the past season, that a feeling of marked antipathy exists against them in official circles in every canton of the republic. Vexatious restrictions and annoyances, amounting in most cases to nothing less than official blackmail, are to be met at every turn. It is a common experience on passing through a village to be peremptorily held up by the local gendarme, who accuses the uphappy motorist of driving at a greater speed than say ten miles an hour, or of having run over some domestic animal in the last village.

Polite assurances to the contrary and angry protests are alike of no avail; the traveler is ordered to go back at once or pay a fine that may be anything from $5 to $25 on the spot, when he is allowed to proceed on his way. Knowing that complaints to superior officials will be met with cold disdain, most tourists prefer to pay the fine and thus save themselves time and further bother and expense. One American alone touring through Switzerland last summer was victimized in this way to the extent of $1,200 in fines inflicted on baseless charges of scorching or other imaginary infringements of the local regulations.

REFINEMENT IN COLOR SCHEMES

Abnormal Hues Giving Place to Rich, Warm Tints—Sugestions for Some Attractive Combinations.

Until such time as automobile owners and users no longer scoff at speed limitations, and cease to defy the established laws of safety, we may expect the wide-spread prevalence of color monstrosities, says M. C. Hillick, in the Carriage Monthly. As a matter of evidence, introduced to sustain their case in the court of public opinion, certain courageous captains of the automobile industry have said, recently, that "under the existing reign of speed mania, the course of safety is best served by painting the horseless vehicle in abnormal colors or combinations of colors."

How much or how little this contention is supported by actual facts is a conclusion left for the reader to reach through the medium of his own personal experience and observation. Suffice it to say—and we are pleased to be able to say it—that the majority of automobiles painted during the past two years have conformed closer to the standard of the trained colorist than the average man is aware of. Of the wide range of colors used, red finds largest display. The term red is, in a sense, an exceedingly broad one, and covers a multitude of favorites, chief among which has been, is now, and promises to long continue to be, maroon. Maroon fills the eye, entices the beholder, thrills the spirit, and under an imperial structure of varnish, displays an unsurpassed luxury of color effects. Other greatly used reds comprise automobile vermilion, a first cousin to English red, with the flush of the sunset pervading it, Aurora red, Rubens red, Mohawk red, deep, French carmine, coach painters' red, coaching red and English vermilion, deep shade. Interspersed between the lights and shadows of these reds are a great number of other reds, more or less admired, and all having a glow and warmth immensely attractive without respect to seasons.

In choice of greens, criticism may be directed, and, we believe, rightly directed, to the lack of relief given these colors upon the surface. The most glorious green the mind may suggest has little capacity for making the most of itself unless given a touch of contrast in association with some other color. For the past two years automobile green, and such other greens as somewhat approximate it in intensity of effect, have chiefly prevailed upon the pleasure automobile. The greens are invariably popular from the fact that they carry the one touch of aristocracy that unites all men in a common admiration of their fourfold graces. Until recently, however, the design of the automobile, speaking in general terms, has not invited the extended use of the dark, rich greens which for more than a decade have met with practically universal acceptance in the practice of carriage painting.

The blues have been widely used, and no less widely abused, during the past 24 months, and prior to that time, upon automobile surfaces.

If a standard was ever contemplated for the prudent guidance of painters in the employment of blue pigments upon the automobile, it has been wholly lost sight of. One of the best-known carriage and automobile painters in New York has admitted to the writer that the family of blue colors has suffered more at the hands of painters who have permitted themselves to be influenced by the clamor of a rebellions public than any class of colors, which admission, by the way, is in itself a sad commentary on the intrusive propensity of an ill-advised following of people.

Automobile blue, a deep, fine blue, fully possessed of the witchery of color, has, of course, led all other members of the blue family in point of popularity. Following has come Richelieu blue, azure and perfect blue, cobalt and ultramarine blue, along with an almost startling variety of modifications from these, running all the way from the now famous Alice blue to the deep-toned, changeable Prussian blue, which to the layman may appear blue or black, as the point of view may disclose. Automobile owners, especially those of the fair sex, have been moved to take liberties with the blue colors to a degree unheard of in the use of most other colors.

That the painters, as a rule, have obeyed their instructions is manifest from the surfaces of blue, which, by the standard of the trained colorist, must pass as actual color deformities. Moreover, the determination of no small number of automobile owners and users to set up an individual scheme of colors for the horseless carriage, to the end that each owner may flaunt an exclusive color upon his machine distinctly unlike that of any other, is responsible for many of the uncouth and unassertive blue pigments worn by the automobile. A society woman of note who braves the scorn of painters, and makes pretense of inventing her own automobile colors, naively declares "it is so easy to dabble in blues!"

Much as we may decry the illogical, incongruous and inartistic choice of colors so widely displayed upon a certain class of automobiles, particularly of the runabout order, we must concede that by virtue of numerous characteristics which even the most consummate designer and builder may scarce hope to eliminate, the precise art of painting applied to the horse-drawn carriage can in no wise find adaptation upon the automobile.

First of all, perhaps, the automobile should be painted in a raiment to promote cheerfulness, and to dispel the gloom sometimes pervading the horse-drawn vehicle dressed in its solemn-visaged pigments. But brightness of raiment and cheerfulness of color perspective should not be associated with sensational effects. Between the sombre effects reduced to a fine art upon the stately brougham or landau, and the lurid colors cast lavishly upon the automobile, is a happy medium to attain, which the automobile builder and the automobile-using public should be moved to unite. A simple elimination of those colors and combination of colors which tend to convert the automobile into a "freak" conveyance will speedily put the painting of the motor car upon an art basis of unchallenged merit. Contributory to this must come, and, in point of fact, is fast coming a quality of surfacing and finish strictly in keeping with the grade of such work applied to the horse-drawn carriage. A new favorite in the family of red pigments, or, rather, what is destined to be a favorite, is Washington red. Washington red possesses the charm of maroon and the brilliancy of carmine. It may be used effectively with the deep shade for the seat panels, medium shade for the lower panels, and the light shade for the chassis. A novelty in this style of locating the three shades of Washington red, which, we may say in passing, is obtained by the use of glazing effects, is worked out by drawing 1-inch stripes of cadmium-toned orange, at a distance of 3 inches apart, vertically through the lower panels, and glazing with No. 40 carmine. The color effects thus obtained are original and decidedly smart.

Graduated striping effects, vivid, without the touch of sensationalism, are to be had over this red by drawing a ½-inch line of Tuscan red and edging this on either side with deep orange chrome to the width of ¼ inch. Then glaze with carmine. Make the stripes vertical and 2 inches apart.

Another combination consists of upper panels of jet black, lower panels deep maroon, and chassis lighter shade of maroon. Then draw vertical 1½-inch stripes, 2½ inches apart, in black, across the lower panels. This style of color effects may be worked out in the reds, greens and blues, and for the season of 1908 it bids fair to prove the piece de resistence in combination novelties.

To obtain a similar color novelty in carmine, bring the ground for the glazing up to the final coat, making the ground for a deep carmine. Then vertically across the lower panels draw ½-inch lines of Tuscan red, 1 inch apart. Then glaze the entire surface with carmine. The, at a distance, almost invisible effects work out admirably upon a fairly close inspection. Philadelphia red is a warm, brilliant red, of a splendid color depth, closely allied in shade to the now famous automobile red, but a bit lighter in tone. This color may be used as an all-one-color scheme pigment, or it may be used in combination with Kimball red, a dark, rich, new western red. Use Kimball red for upper panels, and Philadelphia red for lower panels and chassis, and black all the body mouldings. Imperial red, with

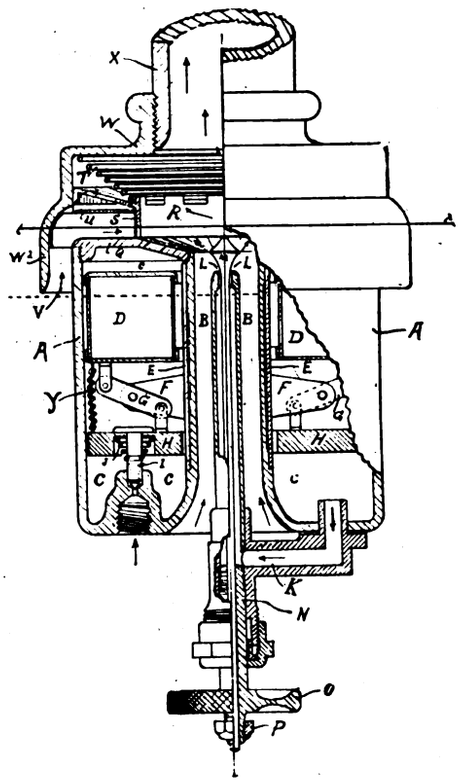
Digitized by Google

fairly the brilliancy of carmine thrust over a field of vermilion, is another red fit for 1908 honors. It can be effectively combined or alternated with any number of an army of other reds. With upper part of the automobile body painted maroon and lower part Imperial red, with a ¼-inch black stripe skirting the panels, you have a combination to catch the fancy of prince and pauper alike.

In greens take the deep, bottle green, made by glazing with yellow lake, and coat the body in solidly. Stripe the panels with double ⅛-inch lines of black, Z inch apart, and 2 inches from edge of panels. For exclusive city use, paint upper panels black, lower panels deep Quaker green, and run a line of gold leaf around all the panels. Paint the chassis light shade of Milori green. Interstate green, a little lighter in tone than olive green, deep, and with more depth and lustre to it, especially when glazed with yellow lake, will be a next year's star in automobile color realms. The upper panels of the automobile body may be painted maroon and lower panels and chassis Interstate green, the whole tricked out with lines of black. Saratoga green, a few shades lighter than Brewster green, light shade, is a new green of striking color lustre, and produces a fine field of green when used alone, and striped with dainty lines of automobile red or No. 40 carmine. Or it may be used effectively in combination with other greens, preferably with darker greens above it.

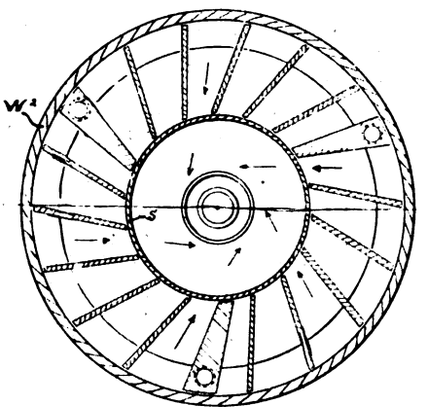
Puritan blue is not listed in color grinders' price schedules, but it is entitled to attention, nevertheless. It is a dark, brilliant blue, and for park and boulevard service it is especially suited. Under hair lines of silver white it affords luxurious effects. It can be used with much success in combination with cobalt blue or with azure blue, deep shade. Manhattan blue has all the wealth of color, or should have, without the sombre touch of ultramarine blue, but possesses a lighter tone. Outlined with vertical stripes of black after the style above described, this blue shows royal effects.

There are at least 24 members of the blue family, all of which may be employed singly, or in combination, upon the automobile. They all have the elegance which invariably attaches to really sumptuous colors, but are not so well adapted for touring car service and across country work as colors of bright er tone and livelier suggestions.



Novelty in a Gasolene Traction Engine.

A distinct novelty is to be found in the case of a patent recently granted on a form of gasolene traction engine in which the principle of the locomotive exhaust blast is utilized to create a draught through the radiator thus obviating the need of a fan. While not directly applicable to the purposes of the ordinary pleasure car, there is yet sufficient apparent worth in the idea to commend a study of it to the consideration of designers of cars of the common type.



UTILIZES CENTRIFUGAL FORCE

Novel Features in a New Carburetter—How the Whirling Principle is Employed and What it Effects.

Two features of novelty and rather unusual merit, are comprised in the new Watts-Detroit carburetter, which has just been placed on the market by the Watts-Detroit Carburetter Co., Detroit, Mich. One of these is designed with a view to elimin-

ating all effects of jar and shock to the device no matter how induced, the construction also compensating for the effect of changing level owing to the inclination of the road. The other feature is intended to

aid in the mingling of the fuel ingredients by a most ingenious application of the principle of the whirling spray.

The popular concentric float principle is employed, to which is added a counter-balance, which not simply steadies the motion of the float, but also acts as a dash plunger, preventing any tendency to dancing, and regulating its motion. The auxiliary air is made to entirely surround the mixing chamber, its entrance being through a series of horizontally inclined converging vanes, which tends to establish a spiral rotation in the mixture as it enters. The effect of this rotational motion is to cause any particles of liquid which may be entrained in the gas, to be thrown outwardly by centrifugal force, thereby encountering directly the concentrated stream of extra air as it enters the chamber, by which means it is broken up and mingled. The inertia of the gas, further tends to continue the spiral motion as it is delivered to the intake manifold, thus effectually preventing any tendency to stratification or pocketing of the fluid.

Structurally, the device is of compact and simple construction. As will appear from the accompanying sectional illustration, the outer shell, A-A, which is a brass casting, carries the central air passage and induction tube, which is constricted through its central portion, the concentric float chamber, C-C, carrying in addition to the usual float, D-D, the counterbalance and plunger disc, H-H, which is linked to the float by means of the equalizing levers, G-G, pivoted to brackets, F-F, carried by the tube, E-E.

The fuel inlet valve, I, is held to its seat by the spiral spring, J, and therefore remains closed except when acted upon by the float mechanism. The jet, L, is controlled by the conical valve, M, regulable from below by means of the adjusting screw, N, and throws a conical stream of fuel up into the mixing chamber, under the influence of the central draught of air drawn through the induction tube from the base of the carburetter.

The cover of the mixing chamber, G, which is in the form of a hood, carries also a series of vanes, placed tangent to the chamber proper, and equally spaced, as a result of which they converge rapidly, forming a series of ducts which introduce the air at a high velocity, to the chamber, R. The amount of air admitted is controlled by means of the automatic annular valve, S, which is seated by the spiral spring, T, over the auxiliary air passage, V, which surrounds the shell. The cap, W-W, covers the top of the mixing chamber and guides the air valve. The outlet pipe X, is vertical and in the center.

Such is the effect of the vane arrangement of the extra air inlet that a suction of one pound per square inch produces a velocity of flow of 332 feet per second at the throats of the tangential passages, which corresponds to a rotational velocity of something like 500 revolutions per second. This rate being sufficient to throw out and break up any particles of fuel which may have passed the jet without being vaporized, thus producing theoretically a perfectly uniform mixture.

OIL TREATMENT OF MACADAM ROAD

Chicago Experiments in Lincoln Park with Good Results—Method Employed to Make a Dustless Roadway.

The treatment of macadam roads with mixtures and emulsions of oils was begun in Lincoln Park, Chicago, during May, 1907, says M. H. West, assistant superintendent of that public domain, in an article dealing with the subject of dust laying and road preservation. In this park the roads are for the most part limestone macadam, but owing to the excessive and fast increasing automobile traffic it was found necessary to re-surface sometimes twice a year.

It was found very difficult to sprinkle with just the right quantity of water, so that no excess would show on the surface. During hot, dry days the dust would arise within a few minutes after the sprinkling cart had passed.

In experimenting with asphalt oils the paramount idea was to lay the dust. Whatever lasting properties the material might give to the road metal was a secondary consideration. Experiments were started with California asphaltum, 98 per cent. pure, bought of the California sales agency at $30 per ton, or about 10 cents per gallon. Sections of road were built with the pure asphaltum oil incorporated in the road metal, as well as being merely sprinkled upon the surface in the form of an emulsion with soap and water. In either form the material proved too sticky to warrant further use.

Experiments were continued, using Kansas and Kentucky fuel oils of different specific gravities, but with minor success, as there seemed to be a lack of sufficient body to maintain a wearing surface. A mixture of two or three oils was then tried, and at last results warranted the adoption of a mechanical mixture or emulsion formed by the use of soap and hot water with the California asphaltum previously described, and a Kansas fuel oil of about 26 degrees specific gravity, purchased at 3½ cents per gallon.

A great deal of care was found necessary in securing a soap which would work best with the water at hand. For the hard lime-water of Lake Michigan, the "Tak-a-nap" brand, a soft naphtha soap, gave the best results. This emulsion when applied to the road surface does not become sticky, on account of the lubricating properties of the Kansas oil, but on the contrary, presents a malleable, rubber-like cushion, which rolls down to a smooth surface under automobile traffic. It penetrates into the road metal sufficiently to give the desired bond, and the surface retains sufficient adhesive properties to cause dust particles to combine with the road surface for a considerable length of time. The road assumes a dark seal brown color, restful to the eyes, and emitting no disagreeable odor, such as is commonly noticed on oiled roads. Traffic may continue unmolested while the oil is being applied, and no bad results have been noticeable on rubber tires or on vegetation.

The mixing plant consists of a series of three 200-gallon hogsheads, set close together on end with their top heads removed. These hogsheads are connected at the bottom with three-inch pipe having gate valves. In each of these receptacles are pipes for live steam and for cold water. From the bottom of the hogshead connecting pipes lead to a steam pump of about 40 gallons capacity. Arrangements are made so that the material can be pumped through any one of the hogsheads back into the same or other compartments through a reduced nozzle; or, so that the material may be pumped from the oil delivery wagon to any of the receptacles; or, from any of the receptacles into a sprinkler, which is used in applying the emulsion to the road.

In making the emulsion, 60 gallons of water are drawn into two of the hogsheads, the third hogshead being disconnected and reserved for heating water for subsequent use. Live steam is then turned on, and the water brought to a boiling point. Fifteen pounds of soap are then added, and the water allowed to boil five minutes longer. Sixty gallons of the Kansas oil are then added, and the mixture allowed to pass out of the bottom of one hogshead, through the steam pump back into the top of hogshead number two, through the agitating hose for about five minutes, when one-half barrel of California asphaltum is added, and the whole mixture allowed to mulsify for twenty minutes longer. It is then pumped into a distributing sprinkler of 800-gallon capacity, fitted with an adjustable cup discharging attachment.

After receiving the stock solution, the sprinkler is filled to its capacity with boiling water. Eight hundred gallons of the emulsion will cover approximately 4,000 square yards of road surface.

Four or five applications should be made as close together as practicable.

Roads in Lincoln Park, treated in this manner on the 19th of June, and having no further applications of oil, have remained in good repair until the middle of October, when a limited amount of patching was found necessary. A number of holes appeared in the surface, which were cleaned and deepened, after which a concrete formed of small stone screenings and hot mixed oils were filled in and tamped down. These roads have given entire satisfaction, there being absolutely no dust visible during the summer months, night or day, and the cost did not exceed one-half cent per square yard for the five applications of emulsion put on in June. One or two further applications will be necessary to carry the roads through the winter.

On several pieces of road where resurfacing was necessary, the following method was used: The road was spiked by steam roller, after which a scarifier was used until the surface was formed to the proper grade. The emulsion was then applied until the road became exceedingly wet. The roller was then sent over the road until the oil and water appeared on the surface, when screenings were put on, and it was again rolled until the surface became dry and thoroughly packed. This allowed the emulsion to penetrate to a depth of four to five inches.

This treatment has been found successful where weather conditions were good. The road must be allowed to harden for 24 hours before traffic is resumed over it, and the work should be done when the weather is hot and dry. Considerable more oil is used in this method of treatment, and the cost for oil and for labor of regrading and resurfacing, costs approximately three-quarters of a cent per square yard.

Where it is found necessary to redress the road with stone, the best results have been obtained by using a three-inch macadam. The large size of the stone gives it an anchorage not easily displaced by passing vehicles or horses' feet. The oil and screenings fill the interstices, giving a bond much more firm than that ordinarily obtained by the use of water. The finest limestone screenings are used. With the use of oil, limestone screenings give better results than do granite or gravel. The absorbent properties of the stone allows the oil to penetrate, giving a better bond than is afforded with the harder stones.

In a series of experiments in succession with the use of pure oils on one of the boulevards subjected to the greatest amount of automobile traffic, the following to date has been found most successful. The badly worn road was spiked and scarified to the depth of four or five inches, and a mixture of 75 per cent. California asphaltum and 25 per cent. Kansas fuel oil, heated to 200 degrees, was applied, one-half gallon per square yard. Three-inch macadam was then spread over the surface, bringing the road to the required grade.

This was rolled thoroughly with a 15-ton roller until the oil began to show on the surface, after which a second application of the hot oils, also to the amount of one-half gallon per square yard, was applied. Limestone screenings were then spread over the surface, and the road was thoroughly rolled; screenings being spread wherever the oil came through. This method was continued until the surface presented a uniform light brown color, and no material adhered to the roller. Traffic was allowed to be resumed at once. Two days later, one application of 10 per cent. emulsion was made.

This road has had no subsequent treatment, and now presents a uniform pavement, but which is soft enough to allow a footing for horses' hoofs, and to prevent automobiles from skidding. The noise resultant from hard pavements is entirely done away with.

The Week's Patents.

864,627. Wheel. William H. Douglas, Belleville, N. J., assignor to Healey & Co., New York, N. Y., a Corporation. Filed Sept. 29, 1906. Serial No. 336,742.

1. A traction wheel for vehicles comprising a wheel hub, spokes extending therefrom, a rim carrying the tire and having means for engagement by the outer ends of the spokes to allow longitudinal and transverse movement of the rim and spokes one relative to the other, and a device for locking and unlocking the rim and spokes, the said device being carried by the rim and having a head at one end adapted to be moved into or out of contact with a spoke.

864,680. Automobile Truck. Thomas Neville and Harry A. Thayer, Oshkosh, Wis Filed Jan. 22, 1907. Serial No. 353,538.

In a device of the class described, a wheeled frame, spaced treads mounted upon the frame, and provided with spaced openings, spaced side pieces upstanding from opposite edges of the treads, chuck blocks proportioned to be disposed upon the tread and between the side pieces, and pins insertible through the openings in the tread and to prevent displacement of the chuck blocks.

864,687. Vaporizer. Carlton R. Radcliffe, New York, N. Y., assignor to International Patent Corporation, Jersey City, N. J., a Corporation of South Dakota. Filed June 5, 1906. Serial No. 320,288.

1. In a vaporizer, an annular reservoir, a fuel discharge nozzle located within the passage through said annular reservoir, a chambered discharge pipe, a perforated partition at the side of the mixing chamber, a controller gate co-operating with said partition to open and close the passages therethrough, a movable funnel-shaped controller co-operating with said gate, having a passage through the same, said passage being located over said nozzle, a portion of said funnel co-operating with said gate to provide air passage around said funnel and between it and said gate, and means to move said funnel toward said gate to reduce the size of the passage between said parts, movement in an opposite direction being produced by the inrush of air.

864,702. Bonnet for Motor Vehicles. John Sherwin, Cleveland, Ohio, assignor to The Garford Company, Elyria, Ohio, a Corporation of Ohio. Filed March 3, 1906. Serial No. 303,999.

1. As an article of manufacture, a "bonnet" for automobiles consisting of a metallic casing having an insulated material applied to and completely covering its inner surface and intimately united therewith.

864,706. Locking Device for Screw Adjustments. James M. Smith, Philadelphia, Pa., assignor, by mesne assignments, of one-half to The Autocoil Company, a Corporation of New Jersey. Filed April 5, 1907. Serial No. 366,472.

1. In combination, a bridge for an induction coil having a vibrator screw in threaded engagement therewith, a friction clamp or shoe slidable in and guided on all sides by said bridge, said shoe having an elongated opening to receive said screw, and a spring for impelling said shoe in a direction to frictionally bind against the threads of said screw.

864,707. Reversing and Speed Changing Gearing. George G. Talmage, Washta, Ia. Filed Nov. 10, 1906. Serial No. 342,826.

1. In a reversing and changeable speed gearing, a drive shaft, a sleeve mounted on said shaft having one end forming the driving member of a differential gearing, the other end of the sleeve formed with a flange, a pinion keyed to said drive shaft, and means to impart motion to said flange from said pinion, substantially as shown and described.

864,708. Power Transmitting Gear. Geo. G. Talmage, Washta, Iowa. Filed Nov. 24, 1906. Serial No. 344,972.

1. A universal joint connecting two shafts comprising a ring, yoke arms extending from one of said shafts and pivotally secured to said ring, a cross-head on one end of the other shaft having a longitudinal hole therein, a pin extending through said hole and the ring, and a set screw secured in said cross-head and engaging said pin, substantially as shown and described.

864,709. Sparking Plug for Gas Engines. Jesse F. Thomas and Herman J. Bolinski, New London, Wis. Filed Aug. 29, 1906. Serial No. 332,524.

1. A sparking plug for gas engines comprising a hollow casting provided with a series of external flanges forming intermediate air spaces, an insulator extending through said casing and the insulator for containing a cooling compound, substantially as described.

864,724. Fluid Clutch Mechanism. Frederick M. Brown, Warren, R. I., assignor of two-thirds to Isabel F. Harris, Providence, R. I. Filed Feb. 2, 1906. Serial No. 299,224.

1. A fluid clutch mechanism comprising an outer casing, an inner casing arranged within said outer casing and forming an inner chamber at one side of the center of the outer casing and having inlet and outlet passages communicating with said inner chamber through its opposite sides, a drive shaft extending through said outer casing and inner casing, an idler shaft journaled within said casing and spaced from the drive shaft, intermeshing gears carried by said shafts within said inner casing with their interengaging teeth in alignment between said inlet and outlet passages, a valve arranged in said outlet passage and operating to regulate the flow of liquid through the inner chamber, and means for actuating said valve.

12,683. Vehicle Brake. Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass., assignors to Sturtevant Mill Company, Portland, Me., a Corporation of Maine. Filed April 27, 1907. Serial No. 370,729. Original No. 799,690, dated Sept. 19, 1905. Serial No. 240,424.

1. The combination with a stationary casing and a driven part or shaft, of a multiple disc brake comprising a series of discs or rings a portion of which are connected with said driven part or shaft, to rotate therewith, and a portion of which are en-

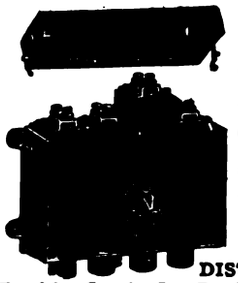
WARNING!



It has come to our attention that certain unscrupulous concerns are making imitation Splitdorf parts, especially the ratchet adjustment screw and the Bogert contact spring. In making these parts we use only the highest grade of iridio-platinum, while in the imitation a base metal is substituted, making them ABSOLUTELY WORTHLESS so far as the operation of the coil is concerned, and the use of them will only break down the coil in a very short time.

All Splitdorf parts are covered by Letters Patent. We are bringing suit for infringement against these parties, and would call special attention to the fact that all genuine Splitdorf parts now bear our registered trade-mark.

The Springfield Motometer

Presents New and Valuable Features

The Maximum Hand: Marks highest speed attained. Resets instantly. Can be disconnected in a moment.

New Easy Reading Dial—Big plain figures. Fired Enamel. Reads from the tonneau.

Spring Steel Reinforce on each end of the driving shaft. Compels easy curves and smooth running. Far better than gears.

Non-Clogging Pinion. Mud proof. Will not hold mud. A rainy weather necessity.

With these additional excellences, the Motometer is more than ever "The Speedometer for Service."

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprockets out of line.—From "Motor World," August 8, '07.

"WHITNEY" CHAINS

January 1, 1907 to November, 1, 1907, conditions as follows:

On January 1, 1907, we were renting about 38,000 square feet of floor space in a building not adapted for our growing business. At the same time we were giving much attention to our new buildings which were under construction, and not completed until July, 1907. During this period we moved our entire equipment to our new factory and for a number of weeks were obliged to operate machinery in both plants. We also carried on important experiments and constructed much special apparatus for our new factory. While thus handicapped we could not fully meet the increasing demand for "Whitney" Chains.. Nevertheless, we succeeded in shipping a greater number than ever before for an equal period of time.

Patented

"WHITNEY" CHAINS

November 1, 1907, to December 31, 1908, conditions as follows:

New fire-proof factory, one of the best, strongest and safest in the country. Floor space over 70,000 square feet. Best of light and excellent conditions for employes. Location one of the best in Hartford. Private side-track connecting with main line between New York and Boston. Land area over ten acres. Large increase in new machinery and tools. Improved methods. Inspection system more rigid than ever. Greater accuracy. Increased strength by the use of new materials and improved treatment. Greater durability. Better finish.

WINTON

We Have the Car

you've been looking for. One that starts from the seat (on compressed air) without cranking. One that gives the widest range of speed on direct drive, in response to throttle. A car that crawls or flies without shift of gear. A quiet, sweet running car. A joltless car. A car fully equipped when you get it. One that gives greatest mileage at minimum wear and tear.

It's the six-cylinder Winton Six-Teen-Six, the exclusive car of the season. Made in the only plant in the world that makes six-cylinder cars exclusively.

"To own such a car is to own a kingdom; the driver's seat is a throne, the steering wheel a sceptre, miles are your minions and distance your slave."*

POPE-TOLEDO

One of Our 1908 Models

As to the policy of the Pope-Toledo factory for 1908, we make the following statements:

1st—Our line for 1908 as shown at the New York Show was acknowledged by dealers, users and the press to be the finest exhibited.

2d—This product is now being manufactured and in fact is largely completed ready for assembling.

3d—Deliveries are being made with our usual promptness in rotation as booked.

4th—The business is being pushed aggressively and progressively; our old agents are being protected and we want new *live ones only*, where not satisfactorily represented.

5th—Our "square deal" policy towards the user and dealer is being continued.

6th—We will make enough cars to take care of the demand.

7th—An aggressive advertising and publicity campaign is being pushed.

8th—Our new catalogue, the finest we have ever issued, is in the printer's hands.

If you want the finest line of cars made in America today, correspond with us at once

THOMAS

THE E. R. THOMAS MOTOR CO. presents four styles of chassis and nineteen styles of bodies

Thomas 4-20 Town Car

Combines luxury with utility and necessity; designed particularly for city and suburban use in good or bad weather, for calling and shopping, for the theatre, for social functions and touring on good roads. This car is furnished with brougham, landaulet, cabriolet, limousine and doctor's car bodies. In Europe this style of car is the vogue, as it rapidly is becoming in America. Prices, $3,000 to $3,250.

Thomas 4-40 Detroit

A marvel of smooth and quiet running with a dash in operation and distinctive style in appearance that denotes the thoroughbred and fascinates the most critical. The 4-40 has been strengthened and improved where the wisdom of experience has suggested. It is especially designed to successfully eclipse at a much lower price, shaft driven cars of the highest price and class. It is equipped with runabout, tourabout, touring and limousine bodies. Prices, $2,750 to $3,750.

Thomas 4-60 Flyer

The Old Reliable is smoother, snappier, faster, lighter, quieter and roomier than ever. It has been redesigned and refined until it has become one of the most beautiful and stylish cars to be seen. The mechanical changes are largely refinements, though the motor generates more power. A bearing between each cylinder is still one of its chief characteristics. It is equipped with runabout, tourabout, landaulet and limousine bodies. Prices, $4,500 to $5,700.

Thomas 6-70 Special

This is the climax of automobile construction, and is one of the most powerful and flexible cars made, retaining as it does, the structural principles that have counted so much for reliability in the Thomas 4-60 Flyer. There is not a single experimental feature in its entire construction. For speed, smooth running on hills and bad roads, and for slow speed, all on the high gear, the 6-70 Special is not equalled. It is equipped with runabout, touring, landaulet and limousine bodies. Prices, $6,000 to $6,900.

"American Mors"

THE CAR BUILT FOR PERMANENCE

You're Sure of Your Trip

When you start in an American Mors you're sure of reaching the destined point without trouble or delay.

No matter what hills, what the condition of the road or other ordinary and even extraordinary automobile obstacles, the American Mors will get you there.

Every part of the American Mors is built to do a specific share of the work—and it does it.

No one part shifts the work on another.

They all work together harmoniously and make "the perfectly balanced car."

AMERICAN MORS TOURING CARS—THREE TYPES:

14-18 H. P., $3,000 24-32 H. P., $5,000 40-52 H. P., $6,000

First Gun

For the 1908

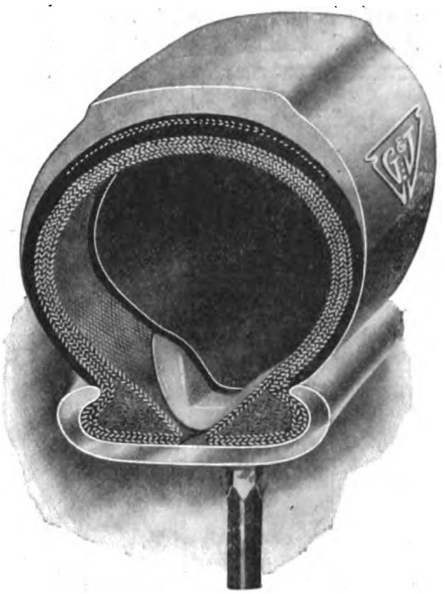
Single Cylinder

Cadillac

Greenville, S. C., Nov. 8, 1907.

CADILLAC MOTOR CAR CO.,
Detroit Michigan.

Gentlemen:—I want to tell you how perfectly delighted I am with the Model T 1908 Single Cylinder Four-passenger Cadillac received a few days ago. I have never seen an engine with such snap, vim and energy. She takes hills like a four-cylinder—and how any man can want anything better—I can't see. This new car rides like a Pullman—and has all the speed and power any reasonable man can possibly want. I must say—I am surprised myself, though I have been a Cadillac enthusiast for years. It is the most magnificent running car I have ever sat in, and on the road this afternoon I passed cars costing more than twice as much, easily. I have examined this car carefully and tried it thoroughly and I do not believe you can make an improvement in it anywhere. Yours truly,



EUGENE F. BATES.

The price of the Model "T" is $1,000. It is the same dependable, constant and economical car that the single cylinder Cadillac has always been, only for 1908 it is better than ever.

Cadillac Motor Car Co., Detroit, Mich.

Member of Association of Licensed Automobile Manufacturers.

Elmore Valveless 2-Cycle

120 Elmore Cars kept in repair by one man

1908

Elmore Thirty, $1750
F. O. B. Factory

The full force of this fact—that 120 Elmore cars in New York are kept in repair by one man—will not come home to you till you have considered what it really means.

Just imagine, one man for instance, trying to take care of half that many cars of the four cycle type—with their hundreds of trouble-giving valves, cams, rollers, springs, lifts and other mechanical complications.

Yet it is being done in New York with the Elmore—because it is the Elmore, because the Elmore is elementally simple, because it has no valves, rollers, lifts, springs, or cams at all, and because it is the most perfect type extant of two-cycle construction.

Elmore Forty, $2500
F. O. B. Factory

If you wish verification of this astonishing and significant fact you can get it through inquiry addressed to A. E. Ranney & Co., New York agents of the Elmore company.

You will find further verification of the fact that Elmore repairs are practically nil and non-existant in every city in the country in which Elmore cars are operated—from every man, in fact, who owns an Elmore car.

From this same man—if he owns a 1908 Elmore car—you will also find verification of the fact that the Elmore ignition system with the installation of the Atwater-Kent spark generator is positively the most wonderful and economical ignition system in existence—a system that will run a car 2,000 miles on one set of six ordinary six-inch dry cells and drain those cells to so low a point that cells discarded by others as useless will operate the Elmore car for miles.

Write for the Elmore literature—but see an Elmore agent.

THE INCOMPARABLE
WHITE
THE CAR FOR SERVICE

WRITE FOR THE NEW WHITE CATALOG

We would like to send a copy of our new catalog to everyone interested in any phase of motoring. Everyone should read, for example, the description of the White generator, that wonderful steam-making device wherein the water is at the top and the steam at the bottom and wherein none of the conditions of the ordinary boiler are present. The references to the continuous success of the White in all forms of competition during the last seven years will also prove of interest. Also, we invite attention to the detailed specifications of our two models—one of 30 horse-power and the other of 20 horse-power—with touring car, runabout, limousine and landaulet bodies.

A POSTAL TO US BRINGS A COPY

THE WHITE COMPANY

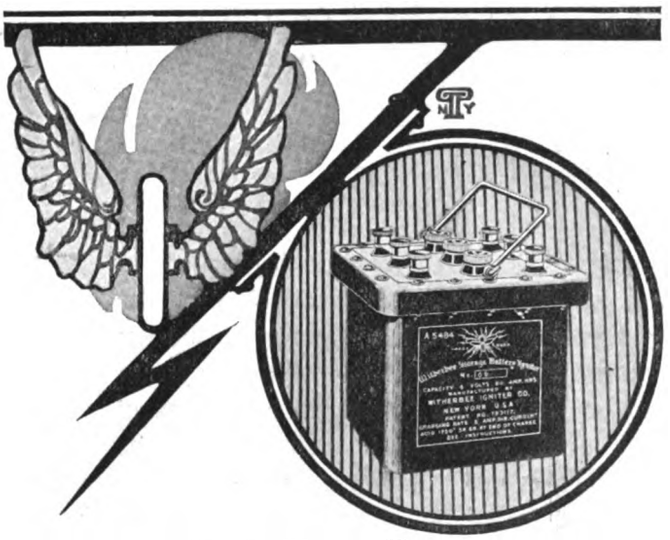
Matheson

Every Matheson car turned out in the last ten years is still running and is reported to be in good condition. Most of the Mathesons turned out within the last three years have never had a single replacement and are still giving perfect service to their original purchasers. Many 1906 Mathesons have to date, been not only free from repairs but from even adjustments. We have many letters from owners of 1907 Mathesons who have given their cars hard and constant use for the last seven months without spending five cents for repairs.



The salient Matheson features are those of the greatest foreign cars. The Matheson differs from these in one important respect—it's better. The great string of Matheson victories during the past season, its new speed records, hill climbing records, endurance records, its perfect scores galore in reliability contests, made not only without need of repairs, but without even adjustments, all these have repeatedly proven to us that there is no room for improvement in the Matheson. We have sought in vain for records of performance that would direct the improvement of a single feature. Feature for feature through the world's output of high powered cars, not excepting the best of the foreign makes, there is nothing that can compare with the Matheson for performance over American roads.

Write for our new booklet, "I Drove my Matheson—" by Matheson owners, some of whom have made thousands of miles without even an adjustment, some of whom have gone through an entire season with a repair bill of nearly five cents. The Matheson sets a standard by which you may judge other high powered cars.

1908 Locomobile

Combines Proved Reliability With Increased Efficiency and Low Cost of Up-Keep

Digitized by Google

The Purchase of An Automobile

has become a purely business transaction in which the returns in satisfactory service, reliability and economy of maintenance are balanced against the investment.

From the standpoints of economical maintenance, absolute reliability and minimum depreciation in market value, the

Rambler

stands preeminently the gilt-edge investment of the industry, a position won and held through years of satisfactory service.

The 1908 models mark the nearest approach to mechanical perfection ever attained.

Our advance catalog, now ready, will show you how and why and a demonstration will convince. Both are at you service. Write today or see the nearest Rambler representative.

GETTING KNOX ON ITS FEET AGAIN

After Long Delay Obstacles to a Plan of Settlement are Removed—Terms of the Agreement Reached.

Objections which prevented the putting into operation of the plan of settlement submitted to the creditors of the Knox Automobile Co., Springfield, Mass., finally have been overcome and accordingly the liabilities will be capitalized and the creditors will practically conduct the business until their claims are discharged. As a result, the company may be said to be in a fair way of being again formally placed on its feet.

Under the terms of the agreement, the company will now issue preferred stock to an amount not to exceed $500,000, to be preferred as to assets and dividends, and to be 8 per cent. cumulative stock, with semi-annual dividends. One share of such stock of a par value of $100 will be issued for each $100 of indebtedness. The net earnings after payment of the 8 per cent. dividend, less whatever amount is required for working capital will be applied to retiring the stock; when it all is retired, the business will, of course, revert to the original stockholders.

The Knox company never had issued any preferred stock and its $363,000 of common stock will draw no dividends until after the retirement of the $500,000 of preferred stock, which now will be issued. The company made an assignment to A. N. Mayo on July 22d last and this plan of settlement was presented early in September. A large majority of the creditors promptly accepte it, but there were several of the larger ones who persistently refused their assent, and progress thus was blocked. What means finally were taken to overcome their objections has not been made known.

When the new arrangement goes into effect six of the nine directors and the clerk and the treasurer will be chosen by the holders of the preferred stock—the creditors—while the other three will be elected by the holders of the common stock who are the officials of the company.

About 200 creditors whose claims are of less than $100 each will receive cash in settlement. The Knox liabilities totaled $556,000, and the assets, as a going concern, $970,000.

Benson Goes from Tires to Cars.

E. R. Benson, secretary of the Hartford Rubber Works Co., has resigned that office to engage with the Cadillac Motor Car Co., Detroit. He will be identified with W. E. Metzger in the sales department. Benson has practically grown up with the Hartford company having worked his way up from the lower rounds; on that account, his change will prove in the nature of a considerable surprise.

Gas Engines Coming from Colorado.

W. H. Green, of Colorado Springs, Colo., has closed a deal with the Hassell Iron Works of that city for the manufacture of a gasolene engine of which he is the inventor and which is claimed to develop more power than the general order of engines. An addition, 60 by 75 feet, is being made to the Hassell plant, to provide for the new department.

To Build Wagons for Farmers.

The Dowagiac Automobile Co. is being formed in the Michigan city of that name for the manufacture of light, high-wheeled motor wagons, designed for farmers' use and which will sell for less than $500. J. A. and J. V. Lindsley, father and son, are the men responsible for the enterprise.

Makers' Committee to Meet in Chicago.

A meeting of the committee of management of the American Motor Car Manufacturers' Association has been fixed to occur in Chicago on Wednesday, December 4. It will be held in the New Southern Hotel, which is convenient to the Coliseum.

THE DEATH OF GEOROE H. DAY

The End Came Suddenly at Daytona—His Busy Career and His Large Place in Automobile History.

George H. Day, who played such mighty parts in the founding and upbuilding of the automobile industry, passed into eternal rest on Thursday morning last, 21st inst. His death occurred suddenly at Daytona, Fla., whither he had gone in quest of health, and while his ailment, heart trouble, was of long standing and was of a nature that many of his friends feared would terminate without warning, the news of Mr. Day's death nevertheless proved a profound shock. He was much in evidence during the Madison Square Garden show in New York early this month, and to outward appearance was in good health. Almost immediately thereafter, however, he suffered an attack and went South, accompanied by two of his sons.

George Herbert Day was born in Brooklyn, Conn., April 3, 1851, his family for four generations having lived in the Quinebaugh valley in that State, the village of Dayville taking its name from his great grandfather. He received such common school education as his native town afforded and afterwards entered Hobart College, Geneva, N. Y., but in the latter part of 1869 was obliged to give up his studies because of an affection of his eyes. In October, 1870, he went to Hartford and entered the employ of the Charter Oak Life Insurance Co. as a clerk, and remained with that company for seven years. He resigned in 1877 to form a connection with the Weed Sewing Machine Co., which, after a boom period, was then struggling against adverse conditions. At about that time Col. Albert A. Pope had become interested in bicycles, and in the following year, having convinced himself that there was a future for bicycles of American man-

THE WEEK'S INCORPORATIONS.

Detroit, Mich.—Grant Automobile Co., under Michigan laws, with $10,000 capital.

Allentown, Pa.—Lehigh Valley Motor Car Co., under Pennsylvania laws, with $10,000 capital. Corporators not named.

Boston, Mass.—Back Bay Garage Co., under Maine laws, with $25,000 capital. Corporators—L. A. Ingalls, president; A. M. Currier, treasurer.

Denver, Colo.—Electric Garage Co., under Colorado laws, with $5,000 capital. Corporators—G. D. Lee, L. S. Sterrett, and L. B. Brown, all of Denver.

Boston, Mass.—Frederick E. Randall Co., under Massachusetts laws, with $25,000 capital; to deal in automobiles. Corporators—Miller A. Dykemann, Herbert F. Croes, and Nellie C. Randall.

Denver, Colo.—Tom Botterill Automobile Co., under Colorado laws, with $50,000 capital. Corporators—Tom Botterill, Frank Botterill, and B. Botterill, all of Denver.

St. Louis, Mo.—St. Louis Auto Exchange, under Missouri laws, with $30,000 capital, fully paid. Corporators—J. E. Brennan, Hugo F. Koch, A. M. Work, and Robert J. Thompson.

New York City, N. Y.—New York Coach & Auto Lamp Co., The, under New York laws, with $2,500 capital. Corporators—Aaron Futterman, Rachel Futterman, and Etta Futterman, 867 East 164th street, New York City.

New York City, N. Y.—Park Avenue Garage, under New York laws, with $125,000 capital. Corporators—William H. Barnard and William H. MacIlroy, 54 Howard street; Edmonds Putney, 2 Rector street, New York City.

Brooklyn, N. Y.—Greenpoint Auto School, under New York laws, with $6,000 capital. Corporators—Clinton D. Anquinos, 177 Nassau street; Charles Miller, 890 Metropolitan avenue; and Joseph Allspach, 160 Meeker avenue, Brooklyn.

New York City, N. Y.—Marion-Overland Automobile Co., under New York laws, with $15,000 capital. Corporators—George W. Garland, Jr., and Albert L. Martin, 1875 Broadway; George P. Strobel, 262 West Ninety-first street, New York City.

New York City, N. Y.—Fleur De Lis Automobile Co., under New York laws, with $25,000 capital. Corporators—Fred Knowlton, 638 East 139th street; Edgar A. Momfort, 1350 St. Nicholas avenue; and Edward D. Cronin, 277 Vanderbilt avenue, Brooklyn.

New York City, N. Y.—Recometer Company of America, under New York laws, with $300,000 capital; to manufacture speed indicating devices. Corporators—Frank W. Waggoner and Frank E. Sarstarphen, 253 Broadway, and Daniel M. Miers, Hasbrouck Heights, N. J.

New York City, N. Y.—George F. Ryan Mfg. Co., under New York laws, with $5,000 capital; to make automobile supplies. Corporators—Fred Knowlton, 638 East 139th street; Edgar A. Montfort, 1350 St. Nicholas avenue, New York City; Edward O. Cronin, 277 Vanderbilt avenue, Brooklyn.

Chalmers Enters Thomas Affairs.

Having purchased a large stock interest in the corporation, Hugh Chalmers, formerly vice-president and general manager of the National Cash Register Co., Dayton, Ohio, has been elected president of the E.

HUGH CHALMERS

R. Thomas Detroit Co. He assumes the duties on December 1st.

E. R. Thomas, of Buffalo, retains his stock holdings and his membership on the board of directors, and in no way loses his identity with the organization. The product will continue to be marketed by the E. R. Thomas Motor Co., of Buffalo.

Mr. Chalmers makes his entry into the automobile industry preceded by a proud reputation. He advanced from the humble position of office boy to that of general manager of the Cash Register Co.—from a salary of less than $5 per week to one of $5,000 per year, every bit of it due to his own efforts. He is credited with being the man who really is responsible for most of the system and other things which have served to make the National cash register concern world famous. He is said to be both forceful and incisive; a lightning thinker and as quick to act. He does not brook incompetency in any form. He has the habit of demanding Why? when things do not go right, and the man who fails to answer it satisfactorily must go elsewhere. It follows that Mr. Chalmers should prove a very vital factor in the automobile business.

IN THE RETAIL WORLD.

Fred J. Pardee, who has the Chicago agency for the Brush runabout, has opened a sales room at 1229 Michigan avenue.

Arlington, Cal., now has an automobile supply and repair shop. R. D. Woodward and C. G. Johnson opened in the Davidson building last week.

Nicholas J. Redmond has opened a garage at 808-814 South Kenzie avenue, Chicago. A general garage and renting business will be done.

A two-story brick garage to cost $8,500 will be erected by the Indianapolis Motor Car Co. It will be located at 419-423 East Market street, Indianapolis.

C. R. Johnson has sold his interest in the Bruick-Johnson Automobile Co., Grand Rapids, Mich., to George Waller. The business will be continued under the old name.

The Cuyahoga Motor Car Co., Cleveland, will erect a new garage at 1054 Euclid avenue. It will be one story high, 45x130 feet. Concrete building blocks will enter into its construction.

The Akron Auto Garage Co., moved into its new garage on East Buchtel avenue, Akron, last week. The building is constructed of concrete, and measures 70x150 feet.

The Northwestern Cadillac Co., now located at 316-322 Fourth avenue south, Minneapolis, will change its location on December 1st. The new home will be at 316-322 Fifth avenue south, where much greater room is to be had.

Reorganization of the Iowa Auto & Tire Co., of Davenport, has been effected by a transfer of stock. The new officers and directors are: President, G. F. Burmeister; vice-president, F. Jungohann; secretary-treasurer, Walter Preister.

The Cleveland Automobile Dealers' Association elected officers last week as follows: President, W. D. Price; vice-president, F. W. Phillips; secretary, Bert Adams; treasurer, H. S. Moore; directors, F. W. Phillips, Bert Adams, George S. Waite, C. M. Brockway, and W. D. Price.

The Buck Auto Carriage & Impiement Co., has not moved from Davenport to Des Moines, Iowa, as stated in a recent issue of the Motor World. It develops that the company has bought out the Goodwin Garage at Des Moines, and has established a branch there, the capital city affording a more central location for the State. The main office will remain in Davenport.

The Algonquin Motor Car Co., with Arthur E. Adams as manager and W. F. McQuillan as treasurer, has been formed to succeed the Henshaw Motor Car Co., as the Boston representatives of the Oldsmobile and Columbus electric. The new company will take over the store occupied by the Henshaw company at 97 Massachusetts avenue. Adams has had wide experience in the automobile field, having been connected with the trade for seven years.

DUNLOP DECLARES 100 PER CENT

Explanation of this Large "Melon Cutting —It Raises the Expectations of Britons Concerning Big Profits.

British investors are active traders in the stock of automobile companies and allied concerns, and are now eagerly awaiting the annual fiscal reports which will show the results of the year's activity and announce the dividends. A dividend of 100 per cent. to the stockholders in a subsidiary concern of the big Dunlop Pneumatic Tyre Co., has for some unexplained reason created expectation of big dividend announcements from the motor car makers, and a generally optimistic feeling prevails on the strength of it. The 100 per cent. dividend, however, went principally to the Dunlop Pneumatic Tyre Co., and such of its shareholders as took stock in the prosperous subsidiary company, and the report for the latter shows how remote is its relation to what may be expected from the complete car manufacturers.

The Dunlop Rubber Co., Ltd., which constitutes the manufacturing division of the Dunlop Pneumatic Tyre Co., discloses for the fiscal year of 1907 a profit of £300,058 as against a profit of £209,969 for 1906, an increase of £90,089, so that the dividend to the shareholders is raised from 82.47 per cent. to 100 per cent. The company's capitalization is 220,000 shares at £1 each, of which shares the Dunlop Pneumatic Tyre Co. owns 181,881, while individual stockholders in the tire company bought the remaining 38,119 Rubber company shares last March at six times their par value, or £6 per share. The net return to the individual stockholders who thus bought at a premium is therefore 16⅔ per cent. on the 100 per cent. dividend basis. In fact it is even a little better than this by reason of the fact that on allotment the purchasers of this stock were required to pay only two-thirds of the purchase price and the remaining third three months later, while the dividend applies from the time of allotment. The showing is so satisfactory that a proposal to give the directors of the company a commission of 2½ per cent. each out of the £5 premium on the 38,119 shares sold to the individual stockholders, was ratified with considerable enthusiasm by the latter at a mass meeting.

Topics for the Chicago Conference.

Standardization of automobile bodies, cooperation between the automobile engineers and the body builders, and the reduction of weight and the proper wheel base for a practical car, are three of the important subjects that are scheduled for discussion at the Chicago meeting of the Mechanical Branch of the Association of Licensed Automobile Manufacturers, which will be held during the Chicago show. Some of the leading body builders of the country will be represented at the meeting and the engineers will endeavor to get their views on how far standardization is possible and to what degree co-operation between the body builders and the engineers may be carried. The meeting will be held at the Chicago Athletic Club, as was the meeting last year. After their official business is over the members of the Mechanical Branch will visit the show in a body for an inspection of the cars on display.

Continental Apportions More Territory.

The Continental Caoutchouc Co. have added two more distributing agencies to their list, viz.: The Plant Rubber Company, Minneapolis, Minn., who will cover Minnesota, South Dakota, North Dakota, Montana and Wyoming, and the Neustadt Auto & Supply Company, St. Louis, Mo., who will act as distributing agents for Eastern Missouri, Oklahoma, Arkansas and Indian Territory.

To Make Accessories in Newark.

The Hydro Carbon Machine Co., a recently incorporated concern, will shortly establish a plant for the manufacture of automobile and motor boat accessories at 431-433 Bloomfield avenue, Newark, N. J. The officers of the company are W. H. Van Alstine, president; J. H. Market, vice-president and treasurer, and Alexander W. Ostler, secretary and general manager.

Maxim Designs a New Phaeton.

It has become known that the car which will be built by Hiram Percy Maxim, former chief engineer of the Electric Vehicle Co., and T. W. Goodridge, former general manager of the Studebaker Automobile Co., who "doubled up" for the purpose, will be a light electric Victoria phaeton. It is said to incorporate several departures.

Michelin Brings Out an "Air Bottle."

A new compressed air tank or "air bottle" as it is called, for use in inflating tires, has been brought out by the Michelin Tire Co. This "air bottle" weighs less than 9 pounds and contains 450 litres of air, compressed to 150 atmospheres, which is sufficient to completely inflate 8 to 10 large tires.

Wahoo Protection for Tires.

Dr. J. G. Smith, of Wahoo, Neb., who has invented an automobile tire protector, has organized a company for its manufacture. A number of Wahoo's "leading citizens" are interested in the venture, Thomas Killian being president of the company, and Dr. Smith himself vice-president.

Two Factories Working Overtime.

There has been no let-up of activity at the factories of the Dayton Motor Car Co., and the Premier Motor Mfg. Co. Both plants are working 24 hours per day.

NOT AFRAID OF AN INVASION

British Editor Stirred by Suggestion of American Competition in Europe—He Sees no Chance for Its Success.

Accounts of the suggested European invasion by the American Motor Car Manufacturers' Association having been cabled abroad, the foreign editors make haste to explain to their readers that it is either a journalistic hoax or a rash and ill-advised proposal which they need not fear in any degree. With smug self-satisfaction and congratulations they recite with what security the manufacturers on the other side have made the local markets proof against American competition.

Al Reeves, the general manager of the Association, having wired as to his safe arrival on the other side in connection with his mission of looking over the field, may be expected to dissolve by his presence the impression that the project is entirely a journalistic invention. The contention of the foreign press that, if serious, the movement is doomed to failure remains.

In that delightful, unabashed, first person singular style which is in such favor among English trade papers, the editor of a prominent automobile weekly sums up the situation in Great Britain, as follows: "I do not say in any levity or real cheerfulness of spirit, but with thankfulness that the British motor trade has been allowed to secure a command of its own market, which no American invasion can now greatly affect. Had the fray come a year ago even, it would have been serious, but to-day our market is so roped in, so closely and enterprisingly covered by our own and the manufacturers of the Continent, that I cannot conceive how these new American raiders are going to win a trade success save by patient and expensive enterprise. We have with us as successful trading propositions at the moment, the White, Cadillac, and Ford cars, from the States. Those who have run these ventures and have won for them their present positions, know what they will have to do to secure a footing on the British market. It is, I suppose, a case of 'needs must when the devil drives,' but many an hour's hard work, many a dollar well spent, will have to be devoted to the task ere the American manufacturer can hope to force a sale for his wares in this country."

Shoemaker to be Receiver's Manager.

C. C. Shoemaker, president of the concern, has been appointed manager for the receiver of the Shoemaker Automobile Co., Elkhart, Ind. He displaces W. E. Johnson, secretary of the company, who first had been named for the position. Shoemaker expects that the receivership will be terminated in about two weeks.

NEW YORK, NOVEMBER 28, 1907

GEORGE HERBERT DAY.

Although it is inevitable, whenever a leader is cut down, it is cause for sorrow. When such a leader as George Herbert Day is cut down, "sorrow" is a word too poor for adequate expression. He was a good friend, a poor enemy. His triumphs were many and always were they triumphs that added to the world's advance. His wisdom was sound and far seeing; his talents always constructive. No man acted larger parts in the automobile industry or acted them so unobstrusively or so unaffectedly. He earned respect—he commanded admiration by deserving it. No man has left a deeper impress on the industry. His loss is its loss.

Clearing Away the Fog.

In addition to being a very large and a very beautiful exhibition, the Chicago show will be a thoroughly happy function—if the urging of the management is taken to heart. The manager has issued an appeal to all prospective exhibitors to leave their troubles, real or fancied, at home, and to bring only smiling faces to Chicago. Says this appeal:

"There were too many wet blankets at the New York shows; too many complaints that there was no business in sight; too much talk about that popular idiocy, 'the money panic'; too free expressions of doubt real or feigned, whether So-and-So would be able to pull through the season; too much pessimism; too much 'knocking'—not only of individual concerns, but of the industry as a whole. . . .

"The Chicago show wants optimists, not pessimists; "boosters," not croakers; pleasant faces, not sighs and regrets.

"There is no money panic in Chicago; but for the newspaper reports of the doings of Wall Street, Chicago would long ago have forgotten that there had been so much as a ripple. And the great West, about which the East knows so little, is fairly bulging with prosperity. . . .

"Let us banish the thought that there is anything the matter with the automobile business."

The appeal, of course, is based on the laugh-and-the-world-laughs-with-you belief, and while it is somewhat overdrawn, it is in the main a laudable effort. The old saw to the contrary notwithstanding, that weepings beget weepings, was never better illustrated than by the very conditions which gave rise to the Chicago appeal. It is a fact that at every large gathering during recent months the tongue of gossip has wagged most vigorously. There has been too much "comparing of notes" and questioning of credits to serve good purposes. These gatherings invariably have been followed by rumors of troubles which never have materialized, and in at least one conspicuous instance, those most concerned directly attribute the crisis in their company's affairs to a well attended meeting of tradesmen at which so many notes were compared, and where whisperings were so general that the mischief done could not be checked.

As very many men in business have reason to know, the so-called "money panic" is not altogether a "popular idiocy." Panic is scarcely a proper word to apply to it, but that it is a time for conservatism and a readjustment of affairs is plain to every thoughtful man, and every man of that type is safeguarding, or has safeguarded his interests accordingly. It does no harm to the automobile business nor to any concern of standing in the business to say that it has been overdone. It has exceeded the speed limit, so to speak. The fact is obvious and public admission of the truth will serve to clear away some of the fog and to explain the tongue-wagging that has caused much of the fog. It profits none to chase rainbows. The fact is equally clear that the automobile industry has not been affected more than other industries have been affected, and that there is no more danger of it going to the dogs than there is danger of other industries going the same way. It will be all the better—all the stronger for the readjustment.

This is the irrefutable situation as it exists, and is the view that should be spread broadcast; it will do more to increase respect and to check the idle tongue of gossip than all the simple faith cures that may be applied.

There is nothing the matter with the automobile business itself. There has been something the matter with some of those engaged in it, and the reasons therefor are not hard to discover.

Bodies and Body Builders.

During the brief period which has elapsed since the construction of the chassis has been such as to permit of the independent fabrication of suitable bodywork, small change has been made in the spirit with which that task has been undertaken. That is to say, the automobile body, however much the principles of the coach building industry have been infused into it, yet is designed and built distinctly and directly for the automobile. A recent proposal indicates indirectly the desirability, and even the future necessity of designing the chassis to fit the body. Furthermore, since the suggestion comes from no less a source than a well-known journal of the carriage trade, it is to be regarded not only as plausible, but as having direct bearing on the eagerness of the carriage builder to absorb as great a portion of the automobile melon as he is permitted to take. Hitherto, his portion has been chiefly rind. His desire to dip into the pulp as well is not only pardonable, but to be expected, since he has a certain legiti-

Digitized by Google

mate right to at least such portion of it as relates to the production of that which is purely carriage work.

The suggestion referred to has to do more particularly with cars of the town type in which the drop frame is used in order to lower the flooring of the passenger section of the vehicle, largely for purposes of convenience in entering. Says the journal in question:

"The drop and rear end was made a necessity when the high rear wheels were adopted, but the latest method is the double drop chassis, which carries with it the necessity of designing the body first and making the drop curve of the chassis to suit the bottom curve or sills of the body. The straight chassis and straight sill body embodied such similarity as made it impossible to make but very few changes in outlines. For this reason so many touring cars seem to be built over the same model, but the double drop chassis will change this somewhat, as different curves may be adopted to suit the styles of the different bodies, and will be quite a change from the straight line chassis and body."

Nor is the idea lacking in wisdom, although its presentation carries a subtle suggestion that the body maker may ultimately become of more than subsidiary importance to the automobile industry. The actual construction of chassis lines in accordance with body specifications evidently is applicable only to a limited extent. Absolute interchangeability between chassis and bodies of certain plan dimensions, is most desirable and any movement tending to further this ideal should be acceptable to all who are connected with the vehicle trade in any way. For certain de luxe types of passenger vehicle, however, this reversed sequence of design would appear to have its advantages.

In fact, it will not be long before either some definite settlement of the body builders' status in the automobile industry will have to be arrived at, or open warfare declared. The excellence of the carriage maker's product as applied to the automobile is not to be questioned; he is not accustomed to occupying a subsidiary position; he demands open recognition for his labors, and rightfully. Yet whether he shall continue to work subordinate to the maker of the mechanical portions of the automobile, whether the two shall share an equally significant relationship, or whether the carriage maker shall succeed to a mastery of the marketing situation, are questions which must be decided in good time, and about the settlement of which must hinge in large measure the final status of the industry.

The Demand and the Supply.

It is not to be questioned that automobiles have become a necessity to the world at large, but more especially to the world at home. People have reached a point where they actually feel the need of motor propelled vehicles. The feeling is spreading, and not all the extravagantly planned and executed cars, not all the wild misuse of the highways by reckless drivers, nor costly lessons in maintenance and upkeep, can check the growth of the sentiment that the motor vehicle is a useful and sometimes a necessary means of transportation.

Here-is a man who drives a crude carriage-like contrivance, plainly of domestic manufacture. In extenuation of its existence, he explains that after his horse died he was left with the phaeton on his hands, and also a two and a half horsepower motor which had been used for another purpose, but which then lay idle. The mechanic's instinct taught him to combine the two in some way for economy's sake—because the horse was dead. Actually, he was possessed of that respect for mechanical propulsion, which has led some more foolish individuals to invest in three thousand dollar cars, when their incomes and requirements only warranted a five hundred dollar expenditure. His inborn economy, however, prevented his giving heed to the impulse until after the equine obstacle was removed from his path.

Here also, are makers catering to such a sentiment, which is not peculiar to this one man, and offering to market parts for converting buggies into automobiles. The thing sounds ridiculous, but it has a solid basis, since it provides for an economical transformation from animal to mechanical propulsion. The motor buggy makers stand next in logical order, and next to them, the makers of light and inexpensive runabouts and commercial vehicles. The makers of cars of larger pretensions, cater to a less extensive and more temporal demand, as the qualities of power and speed, and cost increase.

The automobile market is an accomplished fact. In some quarters, it is nascent, to be sure, while in others it has been overdone. But everywhere there is a demand. Where there is a demand, as where there is a vacuum, there must be an equal supply. The laws of the universe forbid with equal insistency the excess, as well as the paucity of the counteracting influence. Things must equalize, in business as well as physics. What profit or what loss arise from the effort to fulfill a demand, may be counted to the credit or otherwise, of the forces underlying the supply.

The automobile market is a reliable, growing factor in the world of real business. What gain the industry extracts from it, however, depends solely upon the industry itself, and the wisdom with which it is molded to cover the market and nourish or restrain it to the best interests of progress.

COMING EVENTS

November 28, Wilmington, N. C.—Automobile races on Wrightsville beach.

November 28, Riverside, Cal.—Annual hill climbing contest on Box Springs hill.

November 30-December 7, Chicago—National Association Automobile Manufacturers' first annual exhibition of commercial motor vehicles in 7th Regiment Armory.

November 30-December 7, Chicago—National Association Automobile Manufacturers' Annual show in Coliseum and First Regiment Armory.

December 9-14, Detroit, Mich.—Detroit Automobile Dealers' Association show at Wolff's pavilion.

December 14-21, St. Louis, Mo.—St. Louis Manufacturers' and Dealers' second annual show in Jai Alai building.

January 14-18, Hartford, Conn.—Hartford Automobile Dealers' Association's annual show in Foot Guard Hall.

February 10-15, Detroit, Mich.—Tri-State Automobile and Sportsmen's Association's show in Light Guard Armory.

March 9-14, Buffalo, N. Y.—Automobile Club of Buffalo's show.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association show in Duquesne Garden.

It is of passing interest to note that a race for "gentlemen amateurs" will form a feature of the Florida carnival. It is to be hoped that some one will now arise and define that type of amateur. We presume, of course, that he is the sort who lives on wealth for which his father labored and to whom real work is repulsive; but if he has competed for cash or against a professional who has soiled his hands by labor, can he be either or both an amateur o ra gentleman?

DEATH OF GEORGE H. DAY.

(Continued from page 269)

ufacture, he turned to the Weed company, whose condition was such that they accepted and executed a small order for Columbia bicycles. In this way Mr. Day and Col. Pope were first brought together. The former thus ranks as one of the founders of the bicycle industry. He soon became imbued with Col. Pope's faith and enthusiasm and urged that the Weed plant be turned from sewing machines to bicycles. In 1879 he was elected secretary of the Weed company and thereafter his influence became more potent.

Each succeeding year bicycles formed an increasing part of the company's product, and with the enlarging demand the Pope Mfg. Co. acquired larger and still larger blocks of the Weed stock, until in 1890 it took over the entire property. Meanwhile, Day had become president and general manager of the Weed Sewing Machine Co., and when it was absorbed by the Pope Mfg. Co., Mr. Day went with it, being elected president and general manager of the latter concern. He held those offices and the close association with Col. Pope, formed in 1878, continued for twenty-two years or until 1900, when the compressing processes of the American Bicycle Co., more correctly termed the Bicycle Trust, with which the Pope Mfg. Co. had been merged, served to sever the business relationship of the two men.

During the long span of time Mr. Day had seen the bicycle industry grow from a tiny acorn to the mighty oak that spread its branches from ocean to ocean and beyond. The names Pope and Columbia had become household words; the Pope plant had become the greatest of Hartford's many industrial establishments, and one of the greatest in the world. It included not merely two immense factories for the building of bicycles, but a steel tube mill and a tire plant, for the Hartford Rubber Works then was a Pope possession, and a factory for the manufacture of automobiles.

It was while Mr. Day was at the head of the Electric Vehicle Co. that the company purchased the now famous Selden patent, with which the name Day ever will be associated. On and around it he built what many consider his greatest monument, the Association of Licensed Automobile Manufacturers, of which he was the general manager until early in the present year. In effecting its organization, he performed the heroic task of smoothing all differences and conflicting views, of inducing recognition of the patent and payment of royalty, and sharing of business experiences and confidences, and of generally making real and earnest what may be termed a community of interest on the part of nearly all of the leading and rival, and therefore more or less jealous manufacturers of the time, such as few, if any, industries have known. In many respects the A. L. A. M. stands as the ideal commercial organization, and it was brought into being in 1903 in a manner characteristic of Day—without fuss, feathers or flourishes. It was formed and well knit almost before the trade at large was aware that such a movement was under way or realized its scope. The perception and the patience and diplomacy required to perform such an achievement also were typical of Mr. Day, as his creative and directive genius is further exemplified by the gradual development of the successive departments of the A. L. A. M., each with a well defined and useful purpose.

GEORGE HERBERT DAY

His ailment giving warning that his health required more attention, Mr. Day resigned as manager of the A. L. A. M. early this year, and soon after, he went to Florida where he remained several months. When he returned he projected a visit to Europe, but that was abandoned and he spent most of his time at his summer home in Fenwick, Conn., with only occasional dips into business. His counsel was of such value, however, and he was so interested in its work, that only this month he permitted himself to be elected a member of the A. L. A. M. executive committee.

The industries with which he had been identified having done much to build up and add to the growth and importance of Hartford, it follows that Mr. Day was held in high esteem in that city. He was one of the originators of the Board of Trade, but the only semi-public offices which he held were those of park commissioner, and, by designation of the governor, a manager of the Connecticut World's Fair fund in 1893. At the time of his death he was a director or trustee of three Hartford banks and of two insurance companies. He was a vestryman of the Church of the Good Shepherd, but practically the only club of which he was a member was the Engineers' Club of New York.

In 1877 Mr. Day married Miss Katharine Beach, daughter of the then president of the Weed Sewing Machine Co., who, with five children survives him.

Mr. Day's remains were brought from Florida and interred in Cedar Hill Cemetery, Hartford, on Monday last. His funeral was impressive and was attended by a multitude that attested the regard in which he was held. The floral tributes practically overflowed his late residence. As a mark of respect the Pope and Electric Vehicle factories and that of the Underwood Typewriter Co., of which he was a director, suspended operations for the afternoon.

Among those who attended the funeral were Messrs. Charles Clifton, S. T. Davis, Jr., and Thomas Henderson, of the A. L. A. M. executive committee; M. J. Budlong, who succeeded Mr. Day as president of the Electric Vehicle Co., and now fills his chair as general manager of the A. L. A. M.; E. H. Cutler, Mr. Day's immediate successor in the latter office; Albert L. Pope, Charles E. and Wilbur F. Walker, of the Pope Mfg. Co.; J. B. Entz and H. W. Kyte, of the Electric Vehicle Co., and George B. and H. R. Selden.

As his achievements in two revolutionizing commercial movements, here briefly recounted, serve to indicate, Mr. Day was a real captain of industry. He shaped the plans and directed the operations rather than marched, with plumes waving, at the head of the procession, and that his every campaign was marked by impressive success, gives the true measure of the man and of his capacity. If he was dignified he was democratic; there was not a trace of bumptiousness in his make-up. If he was reserved, he was both cordial and consid-

Digitized by Google

erate. If he did not project himself, he did not hold himself aloof. He was always accessible and his handclasp was warm and his tone kindly. He was the sort of man that won confidences. He had to deal with many men—not a few of them inventive cranks—and it is a tribute to his memory that some of the humblest of them were warmest in his praise. He was so gifted that it often was said of him that figuratively he could "kick a man downstairs" so kindly that he man would praise him for the compliment bestowed. Also was he a keen judge of men and if the roll were called of those who won their spurs in the cycle trade or who to-day figure high in the automobile industry, it would be found that the number of them is not small who must bear witness to the helpfulness of the hand of George Herbert Day.

Hill Climbing Car Falls 500 Feet.

Few entries, due to insufficient preliminary advertising, caused the Witter hill climb at Witter Springs, Cal., on Saturday, 16th inst., to be somewhat of a failure. Two accidents further marred the meet. The worst accident was when J. A. Nikrent's Tourist skidded off a dangerous turn and toppled over a 500-foot embankment. The car landed bottom up in a creek below, a mass of wreckage. The driver saved himself by jumping. The second accident was only a minor mishap. When the Lambert car was running fifteen seconds ahead of record time a chain came off, bringing the car to a stop. It was quickly readjusted but the race was lost. Nickrent's accident happened in a special match race, which was won by Frank Murray, Peerless, who climbed the 2⅝-mile hill in 6 minutes 21½ seconds. Driving a Buick in the free-for-all Murray won handily in 6:26. Frank Hill, Peerless, was second, and J. W. Dearup, Lambert, third.

Wildwood Planning a Banked Track.

Success of its two race meets held last summer has prompted the Motor Club of Wildwood, N. J., to talk of building a banked mile track to be used exclusively for automobile racing. The local Board of Trade is said to be interested in the project, for the reason that an automobile track will perhaps bring people to the seaside resort. A real estate company has donated a tract of land just west of Wildwood proper as a site for the proposed track and a preliminary survey has been made for a direct automobile roadway leading from the main highway from Philadelphia to the course. It is stated that work will be started at once.

All the incumbent officers of the Bay State Automobile Association were re-elected at the annual meeting held in Boston last week. They are: President, Elliot C. Lee; vice-president, James P. Coghlin; treasurer, J. C. Kerrison; secretary, James Fortescue.

A. C. A. TAKES A HAND IN FLORIDA

It Will Manage This Winter's "Sandfest"—Forecast of Events that are to Make up the Card.

There will be a Florida beach carnival this winter, after all. The Automobile Club of America unexpectedly announced late last week that at a meeting of its directors it was decided to accept the invitation of the Florida East Coast Automobile Association, composed of W. J. Morgan, the New York promoter, and the Florida hotel and railway men who derive most of the benefits from the meet, and take a hand in managing the annual sandfest.

The past five tournaments on the Florida beach have been conducted by the Florida East Coast A. A., which association, in view of the fact that last year's meet was a lamentable fizzle, doubtless realized that it scarcely could hope to promote another tournament without the aid of some powerful organization; hence the solicitation of the Automobile Club of America to manage the meet. The date of the meet has not been decided, but probably will be in March, and the program has been left to the contest committee of the New York club, of which Robert Lee Morrell is chairman. It is stated that three long distance events will take place, one for gentlemen amateur drivers, one for strictly racing cars, and one for stock cars. To prevent the appearance of freak racing cars in the mile-a-minute and two-miles-a-minute classes, the committee states that the entrants will be compelled to qualify for their events by going at least twenty miles at a minimum speed of about 45 seconds to the mile.

Only $10 for Parkway Speeding.

Offenses of exceeding the speed limit of New York City, when committed in driveways under the control of the Park Commission come under the jurisdiction of the police court magistrates, and that such cases need not be sent to the Court of Special Sessions, notwithstanding a recent ruling of the Appellate Division, was the substance of a decision rendered in the West Side Court, last week, by Magistrate Walsh. It means that while arrests made in other parts of the city may entail fines up to $100, those made in the parks or on the parkways will be limited to a maximum of $10.

The point in regard to the parkways was raised in a brief submitted by Clarence K. McGuire, an attorney, in a previous examination of the defendant, Hugh Fentie, of No. 313 West Forty-seventh street, a chauffeur who was arrested on November 8 for speeding an automobile in Riverside Drive between Seventy-fourth and Seventy-fifth streets. The defendant's attorney desired to bring the case under the jurisdiction of the police court magistrate because the penalty for the violation of the park ordinance is lighter than for violation of the State Motor Vehicle law, and imprisonment does not follow repeated offenses.

Magistrate Walsh made the following memorandum on his decision:—

"Riverside Drive is conceded to be a parkway. It is provided by subdivision 4 of section 3 of the Motor Vehicle law that authorities may enforce rules concerning the speed of motor vehicles in parkways if signs are erected indicating the rate of speed permitted. It is conceded that such signs are on the parkway. That being the fact, I believe the park ordinances are in force, and the offenses thereunder are punishable in the Magistrate's court. The present complaint not charging a violation of the park ordinance, but a violation of the Motor Vehicle law, which is not operative, this complaint must be dismissed, and a new complaint may be drawn covering the violation of the park ordinance which is punishable by this court."

Hotchkiss Appoints Committee Heads.

President William H. Hotchkiss of the American Automobile Association, has announced his appointments to the chairmanships of the various boards for the coming year. The boards have been increased from four to six, the new ones being the Technical and Publication boards The former chairmen are all re-appointees, and are as follows: Legislative, Charles Thaddeus Terry, New York City; Good Roads, Robert P. Hopper, Philadelphia; Touring, Frank B. Hower, Buffalo; Racing, Jefferson DeMont Thompson, New York City; Of the Technical board, N. H. Van Sicklen, Chicago, is chairman, and of Publications, A. G. Batchelder, New York City. The chairmen of these boards will select their committee members, who will be approved by the directors at the next meeting to be held in Chicago preceding the show.

Automobilists' Rights on Turnpikes.

The Laurel Run Turnpike Company, which maintains several roads in the vicinity of Walkes-Barre, Pa., has been made the defendant in a suit brought against it by W. W. Scranton, which will be of interest to all automobilists who have occasion to drive around the Diamond City. The Laurel Run Company has never permitted automobiles to travel over its roads. A few weeks ago Scranton attempted to drive his car over one of the roads, but was held up at a toll gate by the keeper, armed with an axe. Scranton then brought suit against the company to compel it to open the road to automobiles, contending it was a public highway, and automobiles therefore could not legally be barred from it.

"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau St., New York City.

The Chicago Show; What It Will Present

The Chicago show, which this year opens its doors on Saturday next, 30th inst., always has been a much larger show than the average easterner supposes to be the case, and last year, at least, a much handsomer one.

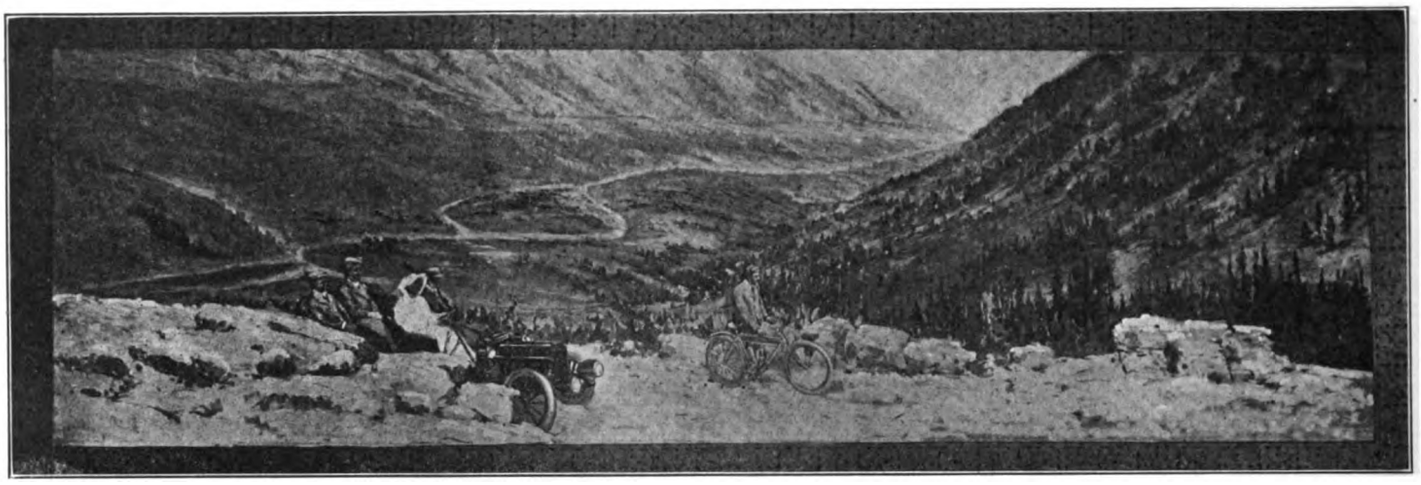
The promoters love to style it "the national show," and, of course, there is some excuse for it. Nominally, at least, it is conducted by the National Association of Licensed Automobile Manufacturers, and the question of Selden license or the lack thereof does not enter into its affairs. For the nonce, Seldenites and "independents" lose sight of the patent that marks the line of demarcation, and exhibit their cars side by side.

Whether or not it is truly "the" national show, there is every promise that the forthcoming show will be not only a larger one than any of its predecessors, but a more beautiful one to look upon. Three buildings—the Coliseum, the First Regiment Armory, and the Seventh Regiment Armory—instead of two, will be required to house it, and one of the armories will be given over wholly for a display of commercial vehicles. The trappings will include 142 oil paintings of motoring scenes, of which 112 will form the backgrounds of the booths. The others will encircle the Coliseum around the gallery front. There will be snow white arches of staff and statuettes of the same material.

What Chicago loses is due to the priority of the two New York shows, which may be said to have absorbed the element of novelty. It will be in the nature of an old story to those who a month and more ago viewed the exhibits in Grand Central Palace and Madison Square Garden, for with very few exceptions the makers whose names are headliners in the industry, already have displayed their wares at one or the other of those functions. As a result, except in the spectacular sense, the student of shows does not expect to be thrilled by new or startling developments. Nevertheless, of the 117 names of car manufacturers listed on the Chicago program, no less than

ONE OF THE EMBLEMATIC STATUETTES

23 will be new to the show this season, even to New Yorkers. Most of them will be indigenous to the western portion of the country, of course, and it is expected that some little individual novelty will be developed among these newcomers.



This list includes such cars as the Pungs-Finch, Silent Knight, Gale, Aerocar, Pierce-Racine, Tincher, Queen, Dolson, Auburn, Shoemaker, Diamond T., and Pullman, while the C. I. V., which is a six-cylinder machine, the Cornish-Friedburg, Lauth-Jeurgens, Lorraine and Oakland cars, are among those which have not been shown before, even in Chicago. In addition, the show will house the Rambler and Berliet cars, both of which in New York were staged at "shows" of their own. The lighter types of car—the runabouts and high wheeled buggies, also will be well represented among those vehicles which were not at either New York show, among them being numbered the Duer, Staver, Monarch, Aurora, Bugmobile, and Stratton.

The commercial section, because it is the first tangible realization of what practically the entire industry has been more or less idly predicting for several years as being the one inevitable thing in connection with the development of the motor vehicle, will constitute a very notable feature of the Chicago function. As the first actual and individual exhibit of commercial vehicles, therefore, as well as being a thoroughly representative one, the commercial section is bound to attract a deal of attention from visitors of the thinking sort, if not from the mere show crowd, in the average sense. Practically speaking, it will reveal about all that was seen in its own line at both of the New York exhibitions, and even as much more which was not seen in the metropolis.

Speaking merely of those machines which have not been exhibited already this fall, from the total of 28 exhibitors, these may be reckoned as new: White, Safir, American, Plymouth, Sayers & Scoville, Continental, Coppock, Gifford-Pettit, Streator, Pittsburg, Worth, Lambert, Pope-Hartford, Mitchell, Couple-Gear, and Meiselbach.

In the accessory line, it is usual to expect a number of exhibitors who do not

Digitized by Google

DECORATIVE PANEL FOR CHICAGO SHOW, SYMBOLIC OF TOURING

find their way east as far as the coast, and who present more or less that is new and novel in one sense or another. Moreover, forecasting the exhibitors of parts and sundries at the Chicago show has usually been rendered more or less ineffective because of the considerable number of non-appearances of those named on the advance list, as well as the actual appearance of others who came late. This year, the task is rendered still more difficult by the fact that sub-letting of space is permitted, as a result of which it is absolutely impossible to predict how many exhibitors will be visible, or what will be the nature of their product.

According to the list, however, it is made to appear that some 35 of the 180 accessory exhibitors present will be showing their goods for the first time this season. These are: T. Alton Bemus, Warner Clutch Co., Triple Action Spring Co., Duplex Coil Co., Longdin-Brugger Co., Pfanstiehl Eletcrical Laboratory, Vivax Storage Battery Co., Never-Miss Spark Plug Co., Imperial Brass Mfg. Co., R. H. Smith Mfg. Co., Motsinger Device Co., Long Mfg. Co., Ross Gear and Tool Co., Western Maleable Steel Co., Corcoran Lamp Co., Whiteley Steel Co., Limousine Carriage Mfg. Co., Standard Lamp and Mfg. Co., Eugene Arnstein, Franco-American Auto & Supply Co., McKenna Mfg. Co., Standard Varnish Works.

Excelsior Supply Co., Atwood Mfg. Co., Edward Neely & Co., Heitger Carburetter Co., Auto Parts Co., Electrical and Mechanical Development Co., Central Rubbers Co., Vehicle Top and Supply Co., Chicago Wind Shield Co., McCord & Co., Cartier, Chapman & Co., and the Atlas Mfg. Co. Four new types of motorcycles also will be shown, namely the Harley-Davidson, Armac, Manson, and Torpedo.

The complete list of exhibitors, grouped according to general location, follows:

Coliseum—Main Floor.

Packard Motor Car Co., Detroit, Mich.—Packard gasolene cars.

Locomobile Company of America, Bridgeport, Conn.—Locomobile gasolene cars.

Wayne Automobile Co., Detroit, Mich.—Wayne gasolene cars.

Electric Vehicle Co., Hartford, Conn.—Columbia gasolene and electric cars.

Knox Automobile Co., Springfield, Mass.—Knox gasolene cars.

Woods Motor Vehicle Co., Chicago, Ill.—Woods electric cars.

Reo Motor Co., Lansing, Mich.—Reo gasolene cars.

Studebaker Automobile Co., South Bend, Ind.—Studebaker gasolene and electric cars.

E. R. Thomas Motor Co., Buffalo, N. Y.—Thomas gasolene cars.

F. B. Stearns Co., Cleveland, O.—Stearns gasolene cars.

Apperson Bros. Auto Co., Kokomo, Ind.—Apperson gasolene cars.

Northern Motor Car Co., Detroit, Mich.—Northern gasolene cars.

Elmore Mfg. Co., Clyde, O.—Elmore gasolene cars.

Olds Motor Works, Lansing, Mich.—Oldsmobile gasolene cars.

Lozier Motor Co., New York—Lozier gasolene cars.

Dayton Motor Car Co., Dayton, O.—Stoddard-Dayton gasolene cars.

Pope Motor Car Co., Toledo, O—Pope-Toledo gasolene cars.

Pope Mfg. Co., Hartford, Conn.—Pope-Hartford gasolene cars.

H. H. Franklin Mfg. Co., Syracuse, N. Y.—Franklin gasolene cars.

Bartholomew Co., Peoria, Ill.—Glide gasolene cars.

Waltham Mfg. Co., Waltham, Mass.—Waltham-Orient gasolene cars.

Premier Motor Mfg. Co., Indianapolis, Ind.—Premier gasolene cars.

Matheson Motor Car Co., Wilkesbarre, Pa.—Matheson gasolene cars.

Maxwell-Briscoe Motor Co., Tarrytown, N. Y.—Maxwell gasolene cars.

Geo. N. Pierce Co., Buffalo, N. Y.—Pierce Great Arrow gasolene cars.

White Company, Cleveland, O.—White steam cars.

Stevens-Duryea Co., Chicopee Falls, Mass.—Stevens-Duryea gasolene cars.

Haynes Automobile Company, Kokomo, Ind.—Haynes gasolene cars.

Winton Motor Carriage Co., Cleveland, O.—Winton gasolene cars.

Royal Motor Car Co., Cleveland, O.—Royal Tourist gasolene cars.

Thomas B. Jeffery & Co., Kenosha, Wis.—Rambler gasolene cars.

National Motor Vehicle Co., Indianapolis, Ind.—National gasolene cars.

Babcock Electric Carriage Co., Buffalo, N. Y.—Babcock electric cars.

Mitchell Motor Car Co., Racine, Wis.—Mitchell gasolene cars.

Pungs-Finch Auto & Gas Engine Co., Detroit, Mich.—Pungs-Finch gasolene cars.

Coliseum Annex—First Floor.

Autocar Co., Ardmore, Pa.—Autocar gasolene cars.

Dragon Automobile Co., Philadelphia, Pa.—Dragon gasolene cars.

Baker Motor Vehicle Co., Cleveland, O.—Baker electric cars.

Cadillac Motor Car Co., Detroit, Mich.—Cadillac gasolene cars.

Peerless Motor Car Co., Cleveland, O.—Peerless gasolene cars.

Imperial Motor Car Co., Williamsport, Pa.—Second Imperial gasolene cars.

Welch Motor Car Co., Pontiac, Mich.—Welch gasolene cars.

Peerless Motor Car Co., Cleveland, O.—Peerless gasolene cars.

Corbin Motor Vehicle Corp., New Britain, Conn.—Corbin gasolene cars.

First Regiment Armory—Main Floor.

Buckeye Mfg. Co., Anderson, Ind.—Lambert gasolene cars.

Columbus Buggy Co., Columbus, O.—Columbus electric cars.

Nordyke & Marmon Co., Indianapolis, Ind.—Marmon gasolene cars.

American Locomotive Auto Co., New York.—American Berliet gasolene cars.

Rauch & Lang Carriage Co., Cleveland, O.—R & L. electric cars.

Western Tool Works, Galesburg, Ill.—Gale gasolene cars.

Aerocar Motor Co., Detroit, Mich.—Aerocar gasolene cars.

Gearless Transmission Co., Rochester, N. Y.—Gearless gasolene cars.

Moon Motor Car Co., St. Louis, Mo.—Moon gasolene cars.

Pierce Engine Co., Racine, Wis.—Pierce-Racine gasolene cars.

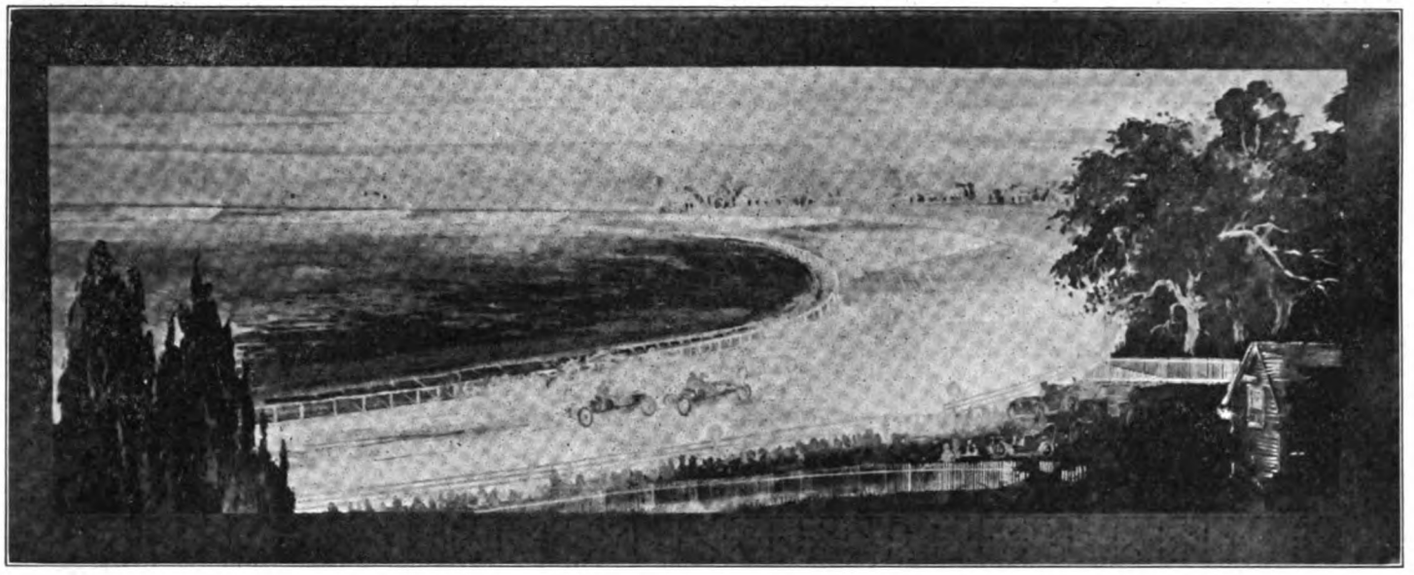
Tincher Motor Car Co., South Bend, Ind.—Tincher gasolene cars.

Austin Automobile Co., Grand Rapids, Mich.—Austin gasolene cars.

De Luxe Motor Car Co., Detroit, Mich.—De Luxe gasolene cars.

Jackson Automobile Co., Jackson, Mich.—Jackson gasolene cars.

American Motor Car Co., Indianapolis, Ind.—American gasolene cars.



Chicago Coach & Carriage Co., Chicago, Ill.—Duer gasolene buggies.

Staver Carriage Co., Chicago.—Staver gasolene buggies.

Oscar Lear Automobile Co., Springfield, O.—Frayer-Miller gasolene cars.

Dolson Automobile Co., Charlotte, Mich.—Dolson gasolene cars.

CLASSIFICATION OF TOURING CARS

System Developed by British Makers Adopted by Royal Automobile Club—How Classes are Determined.

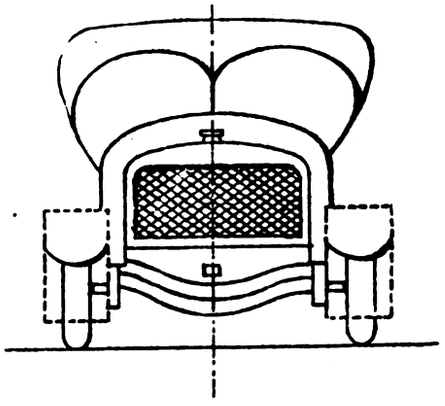
After a long period of consideration, a committee of the Society of Motor Manufacturers and Traders, of England, has developed a system of classification for touring cars, the result being the establishment of a series of 10 types, each defined by certain standard specifications. The Royal Automobile Club has adopted the system, after its confirmation by the Society, and will use it as a basis of classification for its competitions in future. Furthermore, an effort is being made to have other motoring organizations adopt it for general use.

The factors considered in making up the groups embrace the horsepower rating, according to the R. A. C. formulae; a factor composed of the square of the cylinder bore, multiplied by the number of cylinders; the seating capacity; weight, with passengers, tools and equipment, complete; the distance from the dash to the center of the rear axle; and the windage area of the complete vehicle. Each group or class includes cars falling within certain limiting dimensions in these respects, and such is the method upon which they are drawn, that the design and complete specifications of the car are pretty closely defined in this way. The classifications and limiting dimensions are given in the following table:

Standard.	a Engine Rating $= \frac{D^2N}{2.5}$		b Corresponding to D^2N Dimensions.		Minimum Seating Capacity	Weight, with Passengers, Petrol, Tools and Spares.	d Distance from Dash to Centre of Back Axle.	Wind Resistance Area in sq. ft.	
								e Body:—Product of Mean Back Width × Height from Frame.	f Wings:—Area of Vertical Projection of the two Front Wings.	Sum of Body and Wing.
No.	Over	Up to	Over	Up to		Min. cwt	Min. ft. in.	Min.	Min.	Min.
1	0	6.4	0	16	c 2	13	4 0	9½	3	12½
2	6·4	12.0	16	30	2	17	4 0	9½	3	12½
3	12·0	16.0	30	40	4	21	4 9	13	3	16
4	16·0	20.8	40	52	4	25	5 0	13	4	17
5	20·8	25.6	52	64	4	27½	5 9	14½	4	18½
6	25·6	32.4	64	81	4	30	6 0	14½	4	18½
7	32·4	40.0	81	100	4	32½	6 0	14½	4½	19
8	40·0	46.4	100	116	4	35	6 3	15	4½	19½
9	46·4	52.8	116	132	4	37½	6 6	15	4½	19½
10	52·8	60.0	132	150	4	40	6 6	15	5	20

The methods of obtaining the various factors are further explained by the committee responsible for the system, as follows, the letters referring to columns in the above table:

a. R. A. C. ratings for internal combustion engines. For steam cars, equivalent rating to be settled by the Technical Committee of the R. A. C.



b. The dimensions in this column are those governing the classes at Brooklands.

c. In this case, maximum.

d. Distance from Dash to Back Axle.—In the case of "curved" or "dished" dashboards, the measurement is to be made from the back of the foremost plane portion of such dashboard. Cars which so far depart from the usual design as to render the determination of the dashboard's position difficult, or impossible, shall be deemed to have a dashboard 28 inches forward of the front portion of the driver's seat.

e. In measuring bodies for wind resistance area, the mean width at the widest part—usually the back—is to be taken. The height is to be measured from top of frame to top of body, including any projecting upholstery. If the frame be bent upwards at the rear end, then the height is to be taken from the level of top of frame before such upward bend occurs. The bodies contemplated in Table 4 are open touring bodies only.

f. By the "vertical projection of the two front wings" is to be understood the sum

STANDARD OF WINDAGE MEASUREMENTS

of the two rectangles indicated in dotted lines in the accompanying sketch. All touring cars are to have as much wing area to the rear wheels as to the front wheels.

The need of some such system, in the face of the marked inadequacy of horsepower, weight and price classifications, has long been felt. Moreover the various attempts which have been made at rating by formula, while satisfactory in some degree, have nevertheless, fallen far short of the ideal. For several years foreign competitions have been carried out on a formula basis in one way or another, the most elaborate being the British Tourist Trophy, in which the rules used this year and last, were so exacting as to require the construction of special cars for the event. The same unhappy circumstances, also circumscribed the builders of cars for the three great European events of the year, that is to say, the Kaiser cup race, the Grand Prix, and the Targa Florio.

Whether or not the present system will prove sufficiently inclusive, and at the same time, will display sufficient latitude for furthed improvement of cars, remains to be seen. At all events, the effort is one which is worthy of the serious attention of all motorists, and one the outcome of which will be watched with considerable interest. Moreover, it looks toward a broader standardization of design.

SEES WEALTH IN SPARE WHEELS

America Waiting for Them, Helm Declares —Half a Million Dollars His Estimate of Yearly Profits.

From St. Anne, Illinois, to London, England, is a far cry, but the two localities are to be linked by an automobile accessory enterprise for which the diffident promoters, after a most cautious and conservative estimate, promise an annual net profit of $514,440, and that, too, on a beggarly capitalization of about $420,000. This figurative gold mine, while having its theatre of operation in the United States and looking to American pockets for its dividends, is being withheld from American participation in the opportunities it presents for investment, and under the title of the Spare Motor Wheel of America, Ltd., is being financially launched in Great Britain where an eager public is said to have over-subscribed for the 62,000 of the £1 shares which were offered for subscription out of the total of 85,000 shares.

"To manufacture and sell the Stepney spare motor wheel in U. S. A." is the avowed purpose of the company, and that the field is a well chosen one, with possibilities quite proportionate to the magnitude and traditional greatness of the good old "U. S. A.," is made clear by the prospectus which has been filed with the British registrar of joint stock certificates. With an adeptness for multiplication not unpleasantly reminiscent of the renowned Colonel Sellers, who figured that "in India there are 200,000,000 natives; every native has two eyes; and those 400,000,000 eyes need eye-water," the calculations given in the prospectus show that on January 1, 1908, there will be in use in the United States 280,000 automobiles, each automobile having four wheels, and each wheel liable to tire puncture, thus giving the Stepney device "prospective sales on 1,120,000 wheels."

Apparently no attempt will be made to supply all of the 1,120,000 "prospective" wheels the first year, however, a more modest plan of action seemingly having been decided upon. Through the activity of W. W. G. Helm, described as the "late head of the Helm Manufacturing Co., of Jacksonville, Ill.," and who is to be general manager, the company has acquired "the valuable, comprehensive and fully equipped freehold land and factory, plant, machinery, etc., of the St. Anne Kerosene Motor Company, of St. Anne, Ill.," and it is here that the manufacture of the Stepney spare wheel for the American trade will be begun. Associated with General Manager Helm in the manufacture and sale of the device in America will be Lester E. Broyles, "late president of the Bradley Stilwell Co., of Kansas City, Mo." who will be managing director; Ivor F. Thomas, of St. Anne, Ill.,

Digitized by Google

who is slated as resident secretary; and W. H. Titus, of the Clay County State Bank, Excelsior Springs, Mo., who will serve on the "advisory committee in America." Broyles has been engaged for five years at an annual salary of $3,000, supplemented by an arrangement under which he gets 10 per cent. of the net profits of the company for the excess over 50 per cent. On the prospectus estimate of profits this will mean for him at least $30,000 a year, the estimate giving assurance of £102,888 net profit on the £85,000 capitalization. The estimated profits are based on 3,000 wheels a month.

That W. G. G. Helm is the man for his job is indicated by the magnetism of the figures he compiled for the benefit of the British public and which, printed in big, black type in British publications, have served to draw the £ s. d. from the British pocketbooks. Listen to Mr. Helm:

"According to your instructions, I have as thoroughly investigated, as limited time would permit, the automobile situation in America as to the number of cars in use and number manufactured each year; also location of plant, equipment, cost of production, cost of plant and marketing (based on probable demand), and conservative profits based on the following facts, estimates and opinions.

"The facts, figures, and estimates were obtained from those, who are considered the most reliable, experienced, and conservative authorities in their various lines in America. The U. S. Government report is undoubtedly correct, but I regret the statistics are not more up to date.

"Considering there is a continued daily increase of sales of motor cars, and basing my figures on the authorities, I think you may conservatively estimate there are now (Aug. 3) in use in the United States 200,000 machines.

"I do not think there is any doubt but the estimate of 80,000 for 1907 will be reached, showing a gain of 33⅓ per cent. over 1906. The statistics show that since 1906 the United States lead in the number manufactured.

Estimated Profits.

3,000 wheels per month, at $25 each		$75,000.00
Material and productive labor	$559.32	
Non-productive labor.	84.12	
Sales department	97.84	
$741.31, divide by 200, equals	3.71	
Cost of 3,000 wheels, at $3.71	$11,130.00	
Commission, 20 per cent.—$5.00, or 3,000 wheels	15,000.00	
		26,130.00
Monthly profits		$48,870.00
Yearly profits on same basis...		$586,400.00
Less royalty of $2 per wheel...		72,000.00
Annual net profits		$514,440.00 or £102,888

"These figures are based on a production of 40 per cent. reserve stock.

"After considering the above information, and the fact that it was obtained from recognized automobile authorities and other reliable courses, I can conservatively estimate that you should sell 36,000 wheels the first year (and should not be surprised if your sales run 60,000 wheels per annum), my estimate being based on 12½ per cent. of the probable 280,000 cars in use on January 1st, 1908, or, carried still further, you have prospective sales on 1,120,000 wheels, with puncture liabilities. Your succeeding years should show a large increase in sales, as I am thoroughly convinced the wheel has such unusual merits that each one in use will prove an advertisement."

The Stepney spare wheel has for its chief feature a demountable rim carrying an inflated tire, the spare rim and tire carried on the car being readily substituted on the wheel when the tire on the latter is punctured. It is at present enjoying a great popularity in England, being fitted to both taxi-cabs and private machines, and the shares in the British company have yielded 20 per cent. in dividends for nine months business and stand at a 50 per cent. premium. Having thus in a measure conquered England, the conquest of America is the next step, the new company being formed with this purpose. Beyond paying a royalty of $2 per wheel to the parent company, the American company will be entirely independent, and its plan of marketing the wheels is designed to take advantage of that peculiar open-handedness and disregard of price with which the American automobile public is popularly credited. This is brought out in the fact that while the wheels sell for about $14 in England the price in the United States is to be $25, which on a manufacturing cost of $3.71 is rather "rubbing it in," particularly in view of the fact that only those Americans with foresight enough to cable to London for shares will have a chance to participate in the sale to the 1,120,000 "prospectives."

Color Schemes for Trucks.

The business or commercial automobile, speaking upon the basis of a broad application, has received kinder treatment at the hands of the painters than the pleasure vehicles, and for this reason: Owners of commercial automobiles have dictated less in regard to the employment of colors than have the owners of pleasure vehicles, and, as a result, the painters have used color designs suited, in most cases, precisely to the form, size and business requirements of the vehicles. To recite, even in a general way the colors chosen and made use of in the painting of the business automobile would transcend the limits of this paper. We need only to say, remarks the Carriage Monthly, that the range and variety of colors is infinite, and clearly comprehend, within the law of strict harmony, all the known pigments from white to black. At the present time, the business automobile, quite to the same extent as the business wagon, is more or less at the mercy of the Napoleon of colors and the pictorial artists. And to the fancies of these clever craftsmen few can take exception, since the business wagon and the business automobile are in part given over to advertising purposes.

In all the leading American cities one may see daring feats in the treatment of colors executed upon horseless trucks, drays, vans, and commercial wagons generally, and, save an occasional exception, the effects are admirable. Naturally overdisplayed the effects pass uncriticized, being accepted as exaggerations of the advertiser, rather than color misconceptions of the painter. And, indeed, this assumption is more often than not the true one.

The day is not far distant, if, in fact, it has ever been foretold, when other than nominal modifications in the present color treatment of business auto-surfaces may be expected. The business automobile painter has asserted his ability as a colorist, pictorial artist and finisher.

Brilliant reds, greens, both light and deep, blues of pale and deep shade, and yellows running through many intermediate tones, together with warm, soft browns, and grays, with cheer and rest to them, are the colors that promise to win continued favor with owners and users of this class of vehicles.

Combinations of Tuscan and Indian red and any of the yellow pigments, barring the extremely pale tones, furnish rich, pleasing effects. Deep and medium shades of red judiciausly located in combination with the deep, brilliant greens, display effective results. Blues, to be used without offense in combination with other colors, must be handled with caution. Not a few of the soft, neutral browns—those, for example. made chiefly from the siennas—may be placed very effectively in combination with blues. Wine colors and the neutral grays combine nicely together. The ornamental effects applied to these colors, and combinations of colors, and to an infinite variety of others which might be mentioned, not infrequently serve, as they should, to soften down and mellow what might otherwise prove out in the field of service harsh and, possibly, inconsistent effects.

Keeping Dust from the Motor.

Where tightly closing bonnets are employed, it appears a needless refinement to provide a housing for the working parts of the motor, such as the valve gear and magneto. But when it is considered that the chief source of dust and dirt is the suction through the radiation, which becomes the more violent and effective in its scouring action on bright metal parts, the more perfect the enclosure of the hood is made. Not until the cooling air is made to pass through a closed duct, completely isolated from all working parts, will it be really expedient to expose working surfaces to the interior of the motor enclosure.

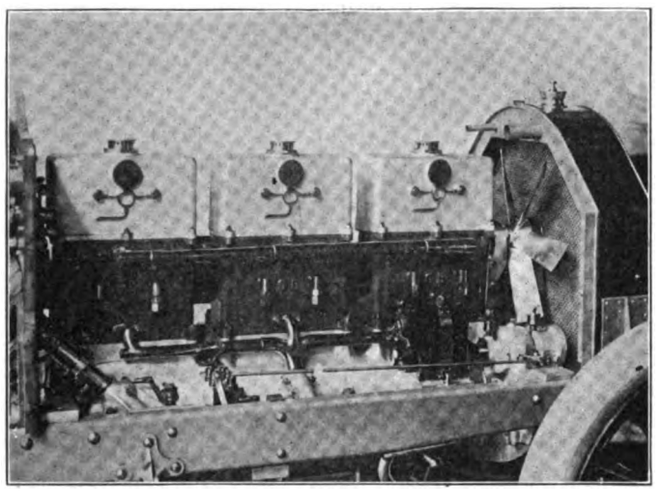
NEW THINGS AT THE LONDON SHOW

They Were Seen Mostly in Detail Features —Some Noteworthy Departures— American Cars that were Staged.

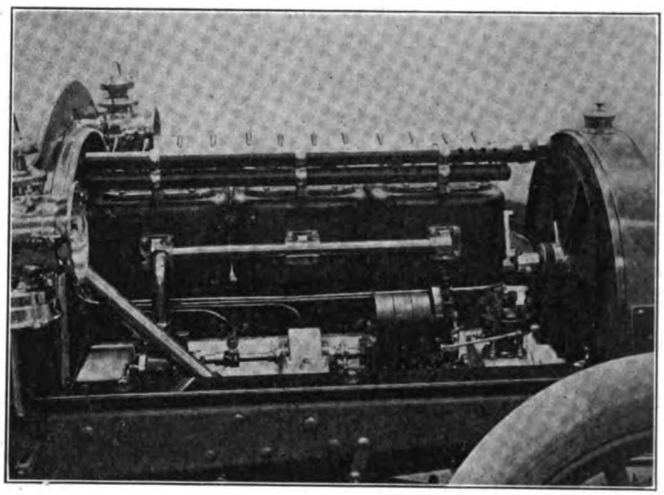
New things at the London show at Olympia, which closed its two weeks' run last Saturday night, were by no means absent, and though no revolutionary complete car designs were disclosed, yet novelty and departure from old practice in detail features were to be found on every hand.

The show was the sixth so-called international motor car exhibition given by the Society of Motor Manufacturers and Traders, and it basked in the sunlight of royal patronage, the flattering presence of H. R. H. the Duke of Connaught gracing the opening ceremonies on Monday, November 11. The body of the immense building was reserved for the car exhibits, while tires and accessories were staged in the galleries. In addition to the cars in the building, there were flocks of demonstration cars outside at the Hammersmith entrance, many of the exhibitors thus showing models outside that space limitations prevented their putting on display in the building.

No uniformity of decoration governed the exhibits and individual fancy was given full play, yet the general effect was not bad. Elaborate arches ornamented with electric lights were the most usual form. Photographers were forbidden to use their cameras after 11 o'clock in the morning, with the result that on account of morning fog and dullness they were seriously hampered in their work. The closing hour in the evening was also advanced to 9 o'clock instead of 10, which was the subject of complaint.



Four American cars, the White, the Cadillac, the Ford and the Buick, were shown, but British makers, of course predominated, with the French, German, Italian and Belgian products next in order; one car from Spain also was in evidence. The total of exhibitors is given as 312, of whom 140 were pleasure car exhibitors, who exhibited some 600 cars.

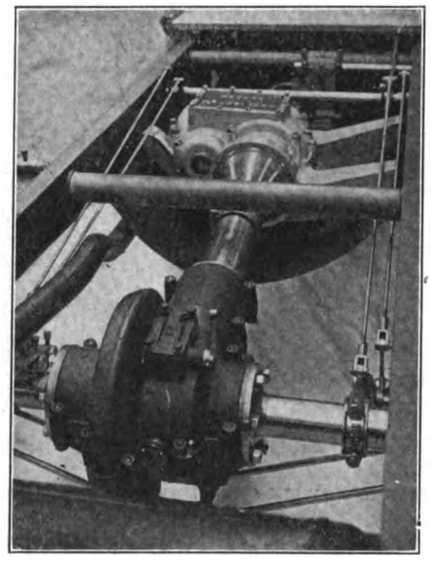


In design tendencies perhaps the most marked features were the majority use of the three-quarter elliptic springs for the rear suspension, and the use of pressed steel frames narrowed in front, to give wider swing to the steering wheels, and raised at the back. Three-quarter platform spring suspension in the rear was also prominent. Ball bearings for crankshafts were shown in a great variety of forms, some in combination with plain bearings, and others employing multiple ball bearings at points where long plain bearings were formerly used, although a few makers this year returned to plain crankshaft bearings. Thermo-syphon cooling was given a large representation and there were numerous examples of the use of one distributor for both the magneto and the accumulator high tension ignition where duplicate systems were employed. Low tension magnetos were comparatively few. A very general effort to have the valve mechanism as clear and accessible as possible was observable, the inlet and exhaust manifolds and piping being so disposed as to give plenty of space around the push rods, springs and caps. In some cases the inlet and exhaust ducts were in the cylinder casting itself, thus minimizing the outside piping. The placing of all valves on one side seemed to be on the increase.

The system of casting all four cylinders en bloc had concrete form in about a half dozen exhibits, while several makers showed six cylinder cars with the cylinders cast in sets of three. The great number of six cylinder cars bore testimony to the popularity which this form of motor now enjoys, and the use of six cylinders in the lower ratings, down to 15 horsepower, indicated to what extent the movement has taken hold.

Direct drive on both third and fourth speed was much in evidence, though direct on third with a geared-up fourth was perhaps the more popular form. A few worm drive cars appeared. Selective transmission was general, the selective mechanism in nearly all cases being enclosed in a box of its own to protect it from mud and dirt. Half-compression cams to make easy the starting were fitted to a large number of cars, while the representation of self-starters, though small, was significant. Clutch brakes to still the gears in the transmission case for gear changing were shown in variety, and in at least one case an additional clutch, back of the gear box, was introduced, so that with the car running the gears all may be brought to a stop.

Hopeful evidences that makers are beginning to realize that set and uniform distances and movements for clutch pedals and operating mechanism will not suit or accommodate all drivers, owing to diversity in leg length or other physical dimensions, came to light in the fact that some of the cars had special provision for adjusting these lengths and distances to please the operator. The leather faced cone clutch held its own against the invasion of the multiple disc, while the floating ring clutch showed new converts. Shaft drive on high powered cars, with propeller shaft enclosed by a casing or sleeve to take the torque, was more general than heretofore, as was the use of chain cases for cars with side chains. In many instances these cases took on the added function of serving as radius rods, a few also carrying the braking strains. In the chain driven cars there was a general tendency to place the differential gear box and countershaft well back, to shorten the chain length from the driving sprockets to the rear wheels. Mechanical lubrication was to be found on the majority of cars. In carburetters there was little novelty, although multiple jets appeared on quite a few of the cars. Wire wheels figured on some of the most prominent exhibits, but gave little sign of any general adoption.



TWO OLYMPIA EXAMPLES OF SIX CYLINDER MOTOR EXTERNAL SIMPLICITY

Digitized by Google

An enumeration of some of the more conspicuous departures from general practice shows that designers and builders have not as yet settled down to any dull ruts so far as detail arrangement is concerned. Thus on the Armstrong-Whitworth car the braking application on the rear wheels is balanced by small differential gears, instead of by pulley block or balance beam. The Bentall car mounts a transmission gear box that is hinged to the frame, so that it accommodates itself to the radial action of the propeller shaft and gives a straight line drive from gear box to rear axle bevel. Clutch position adjustment is provided on the Benz cars. The bonnet on the Alldays car is made in removable halves, dispensing with the usual hinges which are subject to strain and injury. The Brittania has a clutch brake which is composed of an extension of the clutch spring in sleeve form, shaped conically at the end and fitting into a conical boss on the end of the clutch center, thus braking the movement of the clutch when it is withdrawn. The same car has a back axle that permits of ready changes of eight different gear ratios at the bevels, so that the most suitable gear ratio may be fitted. Variable lift to the inlet valve is a feature of the Brown. On the B. S. A. the gas is admitted to the engine cylinders without passing through any pipes from the carburetter, the latter being placed in a recess between the two sets of cylinders and the throttle set up close to the castings. Rubber blocks in the coupling between the clutch shaft and the gear box of the C. G. V. provide a spring drive effect that last year was obtained by the use of spiral springs.

Several unique features distinguish the Chenard-Walcker models that were shown. By adding to the number of layshafts in the gear box the main gear shaft is balanced of strain, and ease of gear changing and freedom of distortion friction are claimed. The fan behind the radiator is backed by a plate which keeps the dust from being thrown on the engine and the high tension magneto current is conveyed to the spark plugs by bare wires instead of heavily insulated leads, the ordinary air being relied upon for insulation. The joints between the cardan shafts and the drive pinion are fitted with radial rollers in corresponding slots, to combine both universal and longitudinal functions. One of the Clyde models displayed a three cylinder engine set transversely across the frame and driving to the rear axle change box by a single chain. In the transmission the gears are always in mesh, changes being effected by dog clutches. A mercury dashpot on the air inlet of the carburetter is a feature of the Wasp. By oxy-acetylene welding the two halves of the back axle casing and differential housing of the Daimler are made practically one piece, covers being provided for removing the differential. The rear springs act also as radius and torsion rods, and ignition, throttle and extra air are controlled by a single lever on the steering wheel. In the chain driven model the chain cases, in addition to acting as radius rods, carry the rear brake spindles. With the bevel drive, differential and change speed all in one case mounted on the rear axle, the Darracq construction presents considerable unsprung dead weight over usual practice, but a saving is claimed in the total weight. The layshaft of the transmission lies transversely across the car, parallel with the rear axle. On the front of the radiator are two knobs for manipulation in starting. One retards the high tension magneto, and the other "tickles" the carburetter. After the car is started the driver is given no further control over the ignition timing.

Canting the rear wheels is made possible on the De Dietrich by introducing universal joints between the ends of the differential

REAR AXLE AND TORSION GROUP OF M. M. C.

shafts and the live axle shafts rotating the rear wheels, so that the latter may be cambered or dished as are the front wheels. The Delaunay-Belleville 15 horsepower six cylinder car has the cylinders cast en bloc in sets of three. On the Dennis car the cylinders, though cast separately, are connected at their adjacent points in such a way as to throw all the water spaces of the jacketing into one. Low tension magnetic plugs appear in the Du Cros Mercedes ignition. A new steam car, the E. J. Y. R., which starts on gasolene and switches to kerosene, has a flash generator and a three cylinder single acting engine, with tappet valves, and has a disconnecting clutch. In the new Fiat the engine is governed by the pump of the oiling system.
